# BRIEF SUBJECT INDEX

- Orientation (Perceptual)** [See Perceptual Orientation]  
**Orientation (Spatial)** [See Spatial Orientation (Perception)]  
**Orienting Reflex** 8777  
**Orienting Responses** 8885, 8911, 8931, 9055  
**Originality** [See Creativity]  
**Orthography** 8825, 9963  
**Orthopedically Handicapped** [See Physically Handicapped]  
**Outcomes (Psychotherapeutic)** [See Psychotherapeutic Outcomes]  
**Outpatient Psychiatric Clinics** [See Psychiatric Clinics]  
**Outpatient Treatment** 10038, 10098, 10193, 10259, 10362  
**Outpatients** 9755, 9798, 9832, 10026, 10038  
**Ovariectomy** 8947, 8949, 8952, 8953, 8960, 8967, 8968, 8969, 9022  
**Overlearning** 8793  
**Overpopulation** 9414  
**Overweight** [See Obesity]  
**Ovulation** 8904, 8907  
**Oxidases** [See Monoamine Oxidases]  
**Oxygen** 9920  
  
**Pacifism** 9487  
**Pain Perception** 8909  
**Pain Relieving Drugs** [See Analgesic Drugs]  
**Paired Associate Learning** 8788, 8790, 8794, 9288, 9887, 9938  
**Palm (Anatomy)** 8930  
**Paradoxical Sleep** [See REM Sleep]  
**Paralysis** [See Cerebral Palsy, Parkinsons Disease]  
**Paralysis Agitans** [See Parkinsons Disease]  
**Paramedical Personnel** [See Also Attendants (Institutions)] 10606  
**Paramedical Sciences** [See Audiology, Nursing, Optometry, Pharmacology, Physical Therapy, Psychopharmacology]  
**Paranoid Schizophrenia** 9728, 9742, 9751, 9783, 9786, 9825  
**Paraprofessional Education** 9713, 9714  
**Paraprofessional Personnel** [See Also Attendants (Institutions), Paramedical Personnel] 9713, 9714, 9719, 10286  
**Parapsychological Phenomena** [See Extrasensory Perception]  
**Parapsychology** [See Also Extrasensory Perception] 8537, 8559  
**Parasympatholytic Drugs** [See Cholinergic Blocking Drugs]  
**Parasympathomimetic Drugs** [See Cholinomimetic Drugs]  
**Parathyroid Disorders** 10298  
**Parent Child Communication** 9980  
**Parent Child Relations** [See Also Father Child Relations, Mother Child Relations, Parental Attitudes] 9296, 9306, 9308, 9311, 9403, 9444, 9457, 9765, 9777, 9875, 9898, 9906, 9911, 10163, 10203  
**Parental Absence** [See Also Father Absence] 9855, 9875  
**Parental Attitudes** 9303, 9858  
**Parental Influence** [See Parent Child Relations]  
**Parental Role** 9310, 9311  
**Parents** [See Also Fathers, Mothers] 9308, 9311, 9444, 9741, 9981, 10239, 10270, 10422, 10430  
  
**Parietal Lobe** [See Somatosensory Cortex]  
**Parkinsons Disease** 9930, 9946, 10104  
**Parks (Recreational)** [See Recreation Areas]  
**Partial Reinforcement** [See Reinforcement Schedules]  
**Partially Hearing Impaired** 9915  
**Participation** [See Also Group Participation] 10500, 10616, 10620  
**Parturition** [See Birth]  
**Passive Avoidance** [See Avoidance Conditioning]  
**Pastoral Counseling** 10265  
**Pathogenesis** [See Etiology]  
**Pathology** [See Psychopathology]  
**Patient Characteristics** [See Client Characteristics, Patients, Personality Traits]  
**Patient History** 9745, 9747, 9770, 9780, 10047, 10322  
**Patient Therapist Interaction** [See Psychotherapeutic Processes]  
**Patients** [See Also Geriatric Patients, Hospitalized Patients, Medical Patients, Outpatients, Psychiatric Patients, Surgical Patients, Terminally Ill Patients] 9701, 10078  
**Pattern (Stimulus)** [See Stimulus Variability]  
**Pattern Discrimination** 8669, 8712, 8721, 8723, 8824, 8977

- Reflex (Unconditioned)** [See Unconditioned Responses]

# BRIEF SUBJECT INDEX

**Reflexes** [See Also Acoustic Reflex, Flexion Reflex, Orienting Reflex] 9016, 9281  
**Regression (Defense Mechanism)** 9809, 9829  
**Regression Analysis** [See Analysis of Variance]  
**Rehabilitation** [See Also Drug Rehabilitation, Psychosocial Rehabilitation, Vocational Rehabilitation] 9674, 9968, 10318, 10324, 10332  
**Rehabilitation (Drug)** [See Drug Rehabilitation]  
**Rehabilitation (Psychosocial)** [See Psychosocial Rehabilitation]  
**Rehabilitation (Vocational)** [See Vocational Rehabilitation]  
**Rehabilitation Centers** [See Also Sheltered Workshops] 10317, 10324  
**Reinforcement** [See Also Differential Reinforcement, Fixed Interval Reinforcement, Positive Reinforcement, Praise, Preferred Rewards, Primary Reinforcement, Punishment, Reinforcement Amounts, Reinforcement Schedules, Rewards, Social Reinforcement] 8776, 8794, 8994, 9006, 9146, 9158, 9159, 9165, 9171, 9178, 9184, 9227, 9238, 9490, 9630, 10191, 10317  
**Reinforcement Amounts** 9147  
**Reinforcement Schedules** [See Also Fixed Interval Reinforcement] 8948, 9140, 9147, 9150, 9186, 9253, 9540, 9689  
**Relapse (Disorders)** 9993  
**Relations (International)** [See International Relations]  
**Relations (Peer)** [See Peer Relations]  
**Relationship Therapy** 10042  
**Relaxation** 8766, 8868, 8913, 9740, 10208  
**Relaxation Therapy** [See Systematic Desensitization Therapy]  
**Relearning** 8994  
**Reliability (Statistical)** [See Statistical Reliability]  
**Reliability (Test)** [See Test Reliability]  
**Religion** [See Also Related Terms] 8566  
**Religious Affiliation** [See Also Judaism, Roman Catholicism] 9350, 9354, 9529  
**Religious Beliefs** [See Also Judaism, Religious Affiliation, Roman Catholicism] 10417  
**Religious Education** 9345, 9346, 9583, 10417, 10452  
**Religious Literature** [See Bible]  
**Religious Personnel** [See Clergy, Nuns]  
**Religious Practices** [See Also Confession (Religion), Glossolalia, Meditation] 9320, 9350, 9438, 10180  
**REM Sleep** 8883, 8924, 10151  
**Remedial Reading** 10503, 10511, 10514, 10528  
**Remembering** [See Retention]  
**Reply (To Professional Criticism)** [See Professional Criticism Reply]  
**Repression Sensitization** 9540  
**Reptiles** [See Lizards]  
**Research** [See Experimentation]  
**Research Design** [See Experimental Design]  
**Research Methods** [See Methodology]  
**Resentment** [See Hostility]  
**Reserpine** 9084, 9110, 9117  
**Residence Halls** [See Dormitories]  
**Residency (Medical)** [See Medical Residency]

**Residential Care Attendants** [See Attendants (Institutions)]  
**Residential Care Institutions** [See Also Halfway Houses, Hospitals, Nursing Homes, Psychiatric Hospitals] 10343, 10353, 10363  
**Resistance (Psychotherapeutic)** [See Psychotherapeutic Resistance]  
**Resistance (Skin)** [See Skin Resistance]  
**Resocialization (Psychosocial)** [See Psychosocial Resocialization]  
**Resonance** [See Vibration]  
**Respiration** 8697, 8898, 9920, 9979  
**Respiratory Tract Disorders** [See Asthma, Laryngeal Disorders]  
**Respondent Conditioning** [See Classical Conditioning]  
**Response Amplitude** 8911  
**Response Bias** 9227  
**Response Frequency** 8804, 9151  
**Response Lag** [See Reaction Time]  
**Response Latency** 8836, 9017  
**Response Parameters** [See Reaction Time, Response Amplitude, Response Frequency, Response Latency, Response Set, Response Variability]  
**Response Set** 9528  
**Response Speed** [See Reaction Time]  
**Response Time** [See Reaction Time]  
**Response Variability** 9154, 9234  
**Responses** [See Also Conditioned Emotional Responses, Conditioned Responses, Conditioned Suppression, Emotional Responses, Orienting Responses, Unconditioned Responses] 8598, 8720  
**Responsibility** 9626  
**Retail Stores** [See Shopping Centers]  
**Retaliation** [See Reciprocity]  
**Retardation (Mental)** [See Mental Retardation]  
**Retarded (Mentally)** [See Mentally Retarded]  
**Retarded Speech Development** 9888  
**Retention** [See Also Recall (Learning), Recognition (Learning), Reconstruction (Learning)] 9019, 9291, 9974, 9982  
**Retention Measures** [See Also Free Recall, Recall (Learning), Recognition (Learning), Reconstruction (Learning)] 8831  
**Retina** [See Also Cones (Eye), Rods (Eye)] 8705, 8714, 8722, 8745, 9074, 9214, 9224, 9229  
**Retinal Image** 8709, 8725  
**Retirement** 9318, 9322  
**Reversal Shift Learning** 8793  
**Review (of Literature)** [See Literature Review]  
**Rewards** [See Also Preferred Rewards] 9253, 9505, 9515  
**Rheumatoid Arthritis** 10124  
**Ribonucleic Acid** 9101  
**Rigidity (Muscles)** [See Muscle Contractions]  
**Rigidity (Personality)** 9332, 9639, 9642, 9698  
**Riots** 9384  
**Risk Taking** [See Also Gambling] 8611, 8850, 9479, 9539, 9552, 10641  
**Ritalin** [See Methylphenidate]  
**Rites (Nonreligious)** 9339  
**Rites (Religion)** [See Religious Practices]  
**Rites of Passage** [See Also Birth Rites, Initiation Rites] 9353  
**Rituals (Nonreligious)** [See Rites (Nonreligious)]

**Rituals (Religion)** [See Religious Practices]  
**RNA (Ribonucleic Acid)** [See Ribonucleic Acid]  
**Robbery** [See Theft]  
**Rod And Frame Test** 8656, 9643  
**Rodents** [See Also Gerbils, Guinea Pigs, Hamsters, Mice, Rats] 8904, 8907  
**Rods (Eye)** 8737  
**Roentgenography** [See Pneumoencephalography]  
**Role (Counselor)** [See Counselor Role]  
**Role Conflicts** 10585  
**Role Expectations** 10063, 10376  
**Role Perception** 10606  
**Role Playing** 8775, 8853, 8854, 9308, 9630  
**Roles** [See Parental Role, Sex Roles]  
**Roman Catholicism** 9361, 10072  
**Rorschach Test** 9316, 9612, 9863, 9959  
**Rotary Pursuit** 9763, 10636  
**Rother Intern Extern Locus Cont Scal** 8592  
**RT (Response)** [See Reaction Time]  
**Running** 8877  
**Rural Environments** 9337, 9435, 9514, 9658, 10084, 10394, 10586, 10590  
  
**Sadomasochism** [See Masochism]  
**Safety** [See Also Highway Safety] 10632  
**Safety Belts** 10633  
**Safety Devices** [See Safety Belts]  
**Salience (Stimulus)** [See Stimulus Salience]  
**Saliva** 8917, 10121  
**Salivation** 8982  
**Saltiness** [See Taste Stimulation]  
**Sampling (Experimental)** 8582, 10411  
**Sarcomas** [See Neoplasms]  
**Satiation** 8963  
**Satisfaction** [See Also Job Satisfaction, Need Satisfaction] 8597, 9313  
**Scales (Intelligence)** [See Intelligence Measures]  
**Scales (Interest)** [See Interest Inventories]  
**Scales (Personality)** [See Personality Measures]  
**Scales (Rating)** [See Rating Scales]  
**Scaling (Testing)** 8649  
**Scalp Disorders** [See Skin Disorders]  
**Schedules (Reinforcement)** [See Reinforcement Schedules]  
**Scheduling (Work)** [See Work Scheduling]  
**Schizoid Personality** 10073  
**Schizophrenia** [See Also Acute Schizophrenia, Childhood Schizophrenia, Chronic Schizophrenia, Paranoid Schizophrenia] 9731, 9736, 9740, 9741, 9742, 9770, 9778, 9780, 9783, 9786, 9795, 9802, 9804, 9805, 9816, 9819, 9823, 9828, 9829, 9992, 9993, 10014, 10028, 10046, 10069, 10073, 10083, 10085, 10086, 10090, 10102, 10170  
**Scholastic Achievement** [See Academic Achievement]  
**Scholastic Aptitude** [See Academic Aptitude]  
**School Achievement** [See Academic Achievement]  
**School Adjustment** 10499, 10553, 10564  
**School Administration** [See Educational Administration]

- Short Term Psychotherapy [See Brief Psychotherapy]
- Shoshone Indians [See American Indians]
- Shuttle Boxes 9170

# BRIEF SUBJECT INDEX

Siblings 9598, 9741, 9790  
 Side Effects (Drug) [See Also Drug Addiction, Drug Adverse Reactions, Drug Dependency, Drug Sensitivity, Heroin Addiction] 9066, 10079, 10085, 10105, 10116, 10125  
 Sight Vocabulary 10449  
 Sign Language 10315, 10335  
 Signal Detection (Perception) 8697, 8706, 8715, 8741, 8810, 8886, 9908  
 Signal Intensity [See Stimulus Intensity]  
 Significance (Statistical) [See Statistical Significance]  
 Similarity (Stimulus) [See Stimulus Similarity]  
 Simulation [See Also Computer Simulation, Heuristic Modeling, Markov Chains, Mathematical Modeling] 10592  
 Simulators [See Simulation]  
 Single Persons 9370  
 Sixteen Personality Factors Question 9604, 9621  
 Size (Apparent) [See Apparent Size]  
 Size Discrimination [See Also Apparent Size] 8636, 8689, 8707, 8719, 8803, 9251  
 Skills [See Ability]  
 Skin Conduction [See Skin Resistance]  
 Skin Disorders [See Also Dermatitis] 10057  
 Skin Electrical Properties [See Skin Potential, Skin Resistance]  
 Skin Potential 8868  
 Skin Resistance 8885, 8911, 9800  
 Sleep [See Also REM Sleep] 8635, 8766, 8864, 8875, 8892, 8902, 9036, 9038, 9054, 9134  
 Sleep Deprivation 8883, 8905, 8924  
 Sleep Disorders [See Also Insomnia, Somnambulism] 9832  
 Sleep Inducing Drugs [See Hypnotic Drugs]  
 Sleepwalking [See Somnambulism]  
 Slow Learners 9262  
 Slums [See Poverty Areas]  
 Smell Perception [See Olfactory Perception]  
 Smiles 9469  
 Smoking (Tobacco) [See Tobacco Smoking]  
 Snails 9179  
 Snake Phobia [See Ophidiophobia]  
 Social Adaptation [See Social Adjustment]  
 Social Adjustment 9302, 9318, 9322, 9326, 9372, 9729, 9890, 10194, 10498  
 Social Approval 9489, 9526, 9756, 9886, 10390  
 Social Behavior [See Also Aggressive Behavior, Animal Aggressive Behavior, Animal Communication, Animal Courtship Displays, Animal Dominance, Animal Maternal Behavior, Animal Mating Behavior, Animal Sexual Receptivity, Animal Social Behavior, Assistance (Social Behavior), Attack Behavior, Attribution, Bargaining, Charitable Behavior, Collective Behavior, Competition, Compliance, Conflict, Conformity (Personality), Conversation, Cooperation, Eye Contact, Gambling, Group Discussion, Group Participation, Group Performance, Interpersonal Attraction, Interpersonal Communication, Interpersonal Compatibility, Interpersonal Influences, Interpersonal Interaction, Interviewing, Interviews, Involvement, Job Applicant

Interviews, Leadership, Leadership Style, Militancy, Negotiation, Participation, Peer Relations, Praise, Psychodiagnostic Interview, Reciprocity, Responsibility, Riots, Risk Taking, Social Adjustment, Social Approval, Social Dating, Social Facilitation, Social Interaction, Social Perception, Social Reinforcement, Trust (Social Behavior), Victimization, Violence, War] 9385, 9658, 10138  
 Social Casework 9718, 10314, 10321, 10327, 10328, 10329, 10331, 10334, 10337  
 Social Caseworkers [See Social Workers]  
 Social Change 9241, 9338, 9340, 9354, 9368, 9405, 9428, 9438, 9456, 9588, 9632, 10248, 10256, 10485, 10598  
 Social Class [See Also Lower Class, Middle Class, Upper Class] 9239, 9404, 9409, 9434, 9876, 9911, 10479, 10485  
 Social Dating 9532, 10254  
 Social Deprivation [See Social Isolation]  
 Social Desirability 8605, 9389, 9596, 10452, 10633  
 Social Environments [See Also Animal Environments, Classroom Environment, College Environment, Communes, Communities, Ghettos, Home Environment, Poverty Areas, Rural Environments, School Environment, Towns, Urban Environments, Working Conditions] 9395  
 Social Equality 9359, 10381, 10396  
 Social Facilitation 9149, 9469  
 Social Groups [See Dyads, Minority Groups]  
 Social Influences [See Also Ethnic Values, Power, Prejudice, Social Approval, Social Desirability, Social Values, Taboos] 9340, 9425, 9437, 9455, 9478, 9479, 9487, 9518, 9639, 9652, 10244  
 Social Interaction [See Also Assistance (Social Behavior), Bargaining, Charitable Behavior, Collective Behavior, Conflict, Conversation, Cooperation, Eye Contact, Group Discussion, Group Participation, Group Performance, Interpersonal Attraction, Interpersonal Communication, Interpersonal Compatibility, Interpersonal Influences, Interpersonal Interaction, Interviewing, Interviews, Job Applicant Interviews, Negotiation, Participation, Peer Relations, Psychodiagnostic Interview, Riots, Social Dating, Victimization, Violence, War] 9396, 9475, 9476, 9479, 9481, 10024, 10119, 10191, 10203  
 Social Isolation 8597, 8927, 8935, 9135, 9199, 9978, 10064, 10191  
 Social Learning [See Also Imitation (Learning), Imprinting] 9540  
 Social Maladjustment [See Social Adjustment]  
 Social Movements [See Also Activist Movements, Civil Rights Movement, Student Activism, Womens Liberation Movement] 9297, 9404, 9413, 9453  
 Social Perception [See Also Attribution] 9377, 9384, 9446, 9475, 9497, 9498, 9499, 9507, 9509, 9511, 9521, 9523, 9525, 9530, 9531, 9532, 9533, 9534, 9536, 9537, 9538, 9541, 9542, 9543, 9547, 9548, 9557, 9571, 9588, 9755, 9864, 9879, 9911, 9980, 10247, 10563  
 Social Processes [See Also Coalition Formation, Human Migration, Immigration, Racial Integration, School Integra-

tion (Racial), Social Isolation, Socialization, Urbanization] 9392, 10487  
 Social Programs 9435, 10248  
 Social Psychiatry 9994, 10031  
 Social Psychology 8527, 8566  
 Social Reinforcement [See Also Praise] 9321, 10190  
 Social Sciences [See Also Anthropology, Child Psychology, Clinical Psychology, Community Psychology, Comparative Psychology, Counseling Psychology, Developmental Psychology, Educational Psychology, Industrial Psychology, Medical Psychology, Neuropsychology, Psychology, School Psychology, Social Psychology, Sociology] 9664, 9703, 10615  
 Social Stress 9459, 10364  
 Social Structure [See Also Lower Class, Middle Class, Social Class, Upper Class] 9297, 9398, 9434, 9441, 9607  
 Social Values 9341, 9373, 9398, 9409, 9446, 9454, 9456, 9501, 9514, 9519, 9525, 9529, 9584, 9627, 9705, 9756, 9879, 10000, 10063, 10243  
 Social Work [See Social Casework]  
 Social Workers 9718, 10327, 10329  
 Socialization 9314, 9868  
 Socially Disadvantaged [See Disadvantaged]  
 Society 9441  
 Sociocultural Factors [See Also Acculturation, Birth Rites, Cross Cultural Differences, Cultural Deprivation, Culture Change, Ethnic Identity, Ethnic Values, Initiation Rites, Rites of Passage] 8843, 8849, 9340, 9349, 9353, 9387, 9398, 9756, 9836, 9846, 9875, 9946, 10026, 10063  
 Socioeconomic Status [See Also Family Socioeconomic Level, Lower Class, Middle Class, Social Class, Upper Class] 8795, 9273, 9325, 9341, 9356, 9398, 9503, 9511, 9873, 9893, 10038, 10480, 10493  
 Sociology 10588  
 Sociometric Tests 9489, 9599  
 Sociopath [See Antisocial Personality]  
 Sociopathology [See Antisocial Behavior]  
 Sociopathy 9992, 9993  
 Sodium Pentobarbital [See Pentobarbital]  
 Somatosensory Cortex 8920, 8979  
 Somatosensory Evoked Potentials 8990  
 Somatotypes 9528  
 Somesthetic Perception [See Also Cutaneous Sense, Pain Perception, Tactile Perception, Temperature Perception, Vibrotactile Thresholds] 8757, 9937  
 Somesthetic Stimulation [See Also Tactile Stimulation] 8718, 8980, 9085, 9937, 10530  
 Somnambulism 9779  
 Sorority Membership 10487  
 Sorting (Cognition) [See Classification (Cognitive Process)]  
 Sound [See Auditory Stimulation]  
 Sound Localization [See Auditory Localization]  
 Sound Pressure Level [See Loudness]  
 Sourness [See Taste Stimulation]  
 South America 8554, 9348, 9356, 10082  
 Space (Personal) [See Personal Space]  
 Spasms 10295  
 Spatial Discrimination [See Spatial Perception]  
 Spatial Organization 9208, 9259

**Spatial Orientation (Perception)** 8688, 8691, 8692, 8696, 8701, 8714, 8726, 8728, 8744, 8745, 8989, 9185, 9232, 9247, 9249, 9643, 10296  
**Spatial Perception** [See Also Apparent Movement, Apparent Size, Depth Perception, Distance Perception, Motion Perception, Size Discrimination, Spatial Organization, Spatial Orientation (Perception), Stereoscopic Vision] 8639, 8644, 8715, 8734, 8741, 8747, 9260, 10530  
**Special Education** 10406, 10409, 10502, 10505, 10507, 10509, 10510, 10511, 10513, 10514, 10519, 10522, 10523, 10524, 10525, 10527, 10528, 10530, 10531, 10532, 10533, 10534  
**Special Education (Aurally Handicap)** [See Aurally Handicapped, Special Education]  
**Special Education (Emot Disturbed)** [See Emotionally Disturbed, Special Education]  
**Special Education (Gifted)** [See Gifted, Special Education]  
**Special Education (Learning Disabil)** [See Learning Disabilities, Special Education]  
**Special Education (Mentally Retard)** [See Mentally Retarded, Special Education]  
**Special Education (Phys Handicaps)** [See Physically Handicapped, Special Education]  
**Special Education (Visual Handicap)** [See Special Education, Visually Handicapped]  
**Special Education Students** 10517, 10526  
**Special Education Teachers** 10385, 10388, 10409  
**Specialization (Academic)** [See Academic Specialization]  
**Spectral Sensitivity** [See Color Perception]  
**Speech** [See Verbal Communication]  
**Speech Characteristics** [See Also Articulation (Speech), Pronunciation] 9557, 9972, 10266, 10482, 10508  
**Speech Development** 9280, 9914, 9972  
**Speech Disorders** [See Also Retarded Speech Development, Stuttering] 9733, 9888, 10528  
**Speech Perception** 8660, 8661, 8664, 8667, 8671, 8673, 8674, 8675, 8680, 9250, 9576, 9742, 9915, 10300  
**Speech Processing (Mechanical)** [See Synthetic Speech]  
**Speech Therapy** 9898, 10196, 10312, 10315, 10335, 10508  
**Speed** [See Velocity]  
**Speed (Response)** [See Reaction Time]  
**Spelling** 8750, 10460, 10528  
**Spinal Fluid** [See Cerebrospinal Fluid]  
**Spokane Indians** [See American Indians]  
**Spontaneous Recovery (Learning)** 9053  
**Sports** [See Judo, Swimming]  
**Spouses** 9299, 9313, 9415, 9419, 9459, 10180, 10185, 10245  
**Spreading Depression** 8957, 8972, 8997, 9018  
**Stability (Emotional)** [See Emotional Stability]  
**Standardization (Test)** [See Test Standardization]  
**Standards (Professional)** [See Professional Standards]  
**Stanford Binet Intelligence Scale** 8586, 8591

**State Hospitals** [See Psychiatric Hospitals]  
**Statistical Analysis** [See Also Analysis of Covariance, Analysis of Variance, Factor Analysis, Frequency Distribution, Item Analysis (Statistical), Mean, Non-parametric Statistical Tests, Normal Distribution, Statistical Measurement, Statistical Probability, Statistical Significance, Statistical Tests] 8558, 8580, 8610, 8614, 8615, 8617, 8618, 8624, 9335, 9560, 9684  
**Statistical Correlation** [See Also Nonlinear Regression] 8589, 8623, 8631, 9615  
**Statistical Measurement** [See Also Analysis of Covariance, Analysis of Variance, Factor Analysis, Frequency Distribution, Item Analysis (Statistical), Mean, Normal Distribution, Statistical Probability] 8633  
**Statistical Probability** 8627  
**Statistical Reliability** 8623, 9818, 10576  
**Statistical Sample Parameters** 8631, 10308  
**Statistical Samples** [See Statistical Sample Parameters]  
**Statistical Significance** 8619, 8620  
**Statistical Tests** [See Also Nonparametric Statistical Tests] 8615, 8617, 8619  
**Statistical Validity** [See Factorial Validity, Predictive Validity]  
**Status** 9460, 9466, 9508, 10478, 10600  
**Stealing** [See Theft]  
**Stereopsis** [See Stereoscopic Vision]  
**Stereoscopic Vision** 8704, 8729, 8732, 8743  
**Stereotaxic Techniques** [See Also Chemical Brain Stimulation, Electrical Brain Stimulation, Spreading Depression] 8859, 9019  
**Stereotyped Attitudes** 9317, 9332, 9333, 9361, 9394, 9508, 9513, 9528, 9547, 9570, 9966, 10436, 10513  
**Stereotyped Behavior** 9042, 9117, 10200  
**Sterilization (Sex)** [See Castration, Hysterectomy, Male Castration, Ovariectomy, Vasectomy]  
**Steroids** [See Also Corticosteroids, Corticosterone, Cortisone] 8899, 9940  
**Stimulation** [See Afferent Stimulation, Auditory Stimulation, Aversive Stimulation, Chemical Brain Stimulation, Electrical Brain Stimulation, Perceptual Stimulation, Self Stimulation, Somesthetic Stimulation, Spreading Depression, Tactual Stimulation, Taste Stimulation, Visual Stimulation]  
**Stimulus (Conditioned)** [See Conditioned Stimulus]  
**Stimulus (Unconditioned)** [See Unconditioned Stimulus]  
**Stimulus Ambiguity** 8731, 8852  
**Stimulus Complexity** 8641, 8644, 8824, 9263, 9574  
**Stimulus Control** 9127, 9155, 9167, 9188  
**Stimulus Deprivation** [See Food Deprivation, Sensory Deprivation, Social Isolation, Water Deprivation]  
**Stimulus Discrimination** 8800, 9112, 9139, 9149, 9176, 9184, 9185, 9188, 9253  
**Stimulus Duration** 8641, 8679, 8682, 8716, 8725, 8740, 8782, 9143, 9166, 9237  
**Stimulus Exposure Time** [See Stimulus Duration]  
**Stimulus Frequency** 8769, 8797, 8852, 9143, 9166, 9268, 9419, 9755, 9892

**Stimulus Generalization** 8800, 9139, 9153, 9158, 9188  
**Stimulus Intensity** 8674, 8884, 8901, 8911, 9181, 9227  
**Stimulus Intervals** [See Interstimulus Interval, Intertrial Interval]  
**Stimulus Novelty** 8777, 9069, 9169, 9174, 9268  
**Stimulus Parameters** [See Also Interstimulus Interval, Intertrial Interval, Stimulus Complexity, Stimulus Duration, Stimulus Frequency, Stimulus Intensity, Stimulus Novelty, Stimulus Salience, Stimulus Similarity, Stimulus Variability] 8611, 8694, 8798, 9187, 9227, 9246  
**Stimulus Pattern** [See Stimulus Variability]  
**Stimulus Presentation Methods** [See Also Tachistoscopic Presentation] 8639, 8644, 8646, 8664, 8685, 8694, 8735, 8773, 8798, 8828, 8836, 9255, 9289, 9892, 9938  
**Stimulus Saliency** 8800  
**Stimulus Similarity** 8689, 9288  
**Stimulus Variability** 8613, 8743, 8792, 8830, 8866  
**Stochastic Modeling** [See Markov Chains]  
**Strain Differences (Animal)** [See Animal Breeding, Genetics]  
**Strategies** 9258, 10591  
**Stress** [See Also Occupational Stress, Physiological Stress, Psychological Stress, Social Stress, Stress Reactions] 9033, 9327, 9472, 9643, 9826, 10075, 10359  
**Stress Reactions** 8868, 9772, 9958, 9964  
**Stroboscopic Movement** [See Apparent Movement]  
**Strychnine** 9074  
**Student Activism** 9384  
**Student Admission Criteria** 9660, 9706  
**Student Attitudes** 9336, 9411, 10402, 10479, 10485, 10487, 10491, 10500, 10501  
**Student Protest** [See Student Activism]  
**Student Teachers** 10382, 10420  
**Student Teaching** 10409  
**Students** [See Also College Students, Elementary School Students, Foreign Students, Graduate Students, High School Students, Junior High School Students, Kindergarten Students, Medical Students, Nursery School Students, Nursing Students, Special Education Students, Vocational School Students] 10482  
**Studies (Followup)** [See Followup Studies]  
**Studies (Longitudinal)** [See Longitudinal Studies]  
**Study Habits** 10432, 10450, 10486  
**Stuttering** 9914, 9915, 10196  
**Subcortical Lesions** [See Brain Lesions]

**Work Study Programs** [See Educational Programs]

**Work Week Length** 10619

**Workers** [See Personnel]

## BRIEF SUBJECT INDEX

Workers (Agricultural Extension) [See  
Agricultural Extension Workers]  
Working Conditions [See Also Work  
Week Length] 10622, 10628  
Workshops (Sheltered) [See Sheltered  
Workshops]  
Worship [See Religious Practices]  
Writing (Creative) [See Literature]

Writing (Handwriting) [See Handwriting]  
Written Language [See Also Handwrit-  
ing, Letters (Alphabet), Numbers (Nu-  
merals)] 8536, 8558, 8771, 9271, 9553,  
9605, 9963

Xylocaine [See Lidocaine]

Yoga 9990  
Young Adults 8736, 8770, 8795, 8847,  
9300, 9321, 9328, 9404, 9413, 9848, 9968,  
10017, 10173, 10199, 10200, 10206  
Youth (Adolescents) [See Adolescents]  
Youth (Adults) [See Young Adults]  
Youth (Children) [See Children]  
Yugoslavia 9265

# AUTHOR INDEX

The Author Index is intended to be a name index only and not a person index. "Adams, P" will be listed separately from "Adams, Paul" even though the names may refer to the same person; however, two listings for "Adams, P." may refer to two different authors. All authors are listed, not just primary authors.

# PASAR Search Request Guidelines

## P PA PAS PASA PASAR

*is an innovative service designed to benefit the individual users of psychology-related information. It provides a comprehensive literature search capability at a level of complexity achievable only through automated retrieval techniques. The intellectual burden for conducting an effective search is shared by the requester and APA information specialists who formulate specific retrieval strategies, augmenting vocabulary and other search parameters supplied by the requester. Experience has provided APA information specialists with the skills to efficiently interact with the automated data base which contains records published in PSYCHOLOGICAL ABSTRACTS from 1967 through the present.*

*Charges for processing PASAR requests are based on the amount of computer time required to perform a search. Typically these charges range from \$40 to \$60 and will not exceed \$100 unless the requester is contacted first. The total charge for a search is based on its complexity and is in most cases unrelated to the number of references retrieved. For example, a complex search strategy involving many variables or limiting factors may require more computer time and may result in fewer references retrieved than a broad search with few limiting factors.*

The PASAR Request Form has been designed to assist you in constructing a comprehensive statement of your requirements. However, it should not restrict your input. Provide whatever other information you feel will augment the information specialist's understanding of your requirements. These guidelines should help to clarify items on the Request Form.

**ITEM 1. Narrative statement of search topic.** Provide a detailed description of the subject matter you wish to be retrieved. Please avoid submitting multiple, discrete requests on a single PASAR Request Form, since such cannot be processed for a single fee. However, multiple aspects of a primary subject may be requested. The distinction is illustrated in the following examples:

*Acceptable:* "the effects of socioeconomic status, education level, or birth order on career motivation in women."

"Career motivation" is the primary element of this request, while the other elements serve merely to qualify or narrow the scope of this rather broad subject area.

*Unacceptable:* "the measurement of employee attitudes concerning wages and benefits. Also desire references dealing with the factors that influence management decision-making with respect to personnel policies and procedures."

Although these two topics are closely related to the design and administration of personnel policies and procedures, two separate search strategies would have to be executed to retrieve the specific information requested, and a separate charge for each would have to be made.

**ITEM 2. Descriptor(s) relevant to dependent variable(s).** Provide a list of words or phrases that indicate the subject matter of prime interest. Descriptors for the "acceptable" example (see Item #1) might include: career motivation, career preference, and career aspirations.

**ITEM 3. Descriptor(s) relevant to independent variable(s).** Provide a list of words or phrases that will qualify or narrow the scope of the dependent variable. Descriptors for the "acceptable" example (see Item #1) might include: socioeconomic status, social class, educational level, birth order, and women.

**ITEM 4. Search qualifications.** Once the subject matter of the search has been defined, you may wish to refine it with specific requirements such as population or time frame. These qualifications are often essential to the actual information need; however, they can unnecessarily limit the search, causing retrieval of few of the relevant records. Therefore, consider your requirements carefully.

**ITEM 5. Sorting requirements.** Please indicate whether you would prefer to have references sorted alphabetically by author or chronologically by year.

**ITEM 6. Intended use of search results.** Provide a description of how the references resulting from your search will be used (e.g., definition of a research project, preparation of an article, proposal preparation, dissertation, etc.).

**Ordering information:** When ordering a PASAR search, please read the above guidelines carefully before completing the request form. A purchase order must accompany all institutional requests for a PASAR search. For individuals requesting a PASAR search, the signature of the person responsible for payment must appear on the PASAR request form.

## KEY TO THE TEXT

The examples of different types of *Psychological Abstracts* records presented here are number coded to provide definition of their elements.

## JOURNAL ARTICLE ABSTRACT

'8327. <sup>2</sup>Howard, R. Lee.; Glendinning, Robert L. & Meyer, Donald R. <sup>3</sup>(Ohio State U ) <sup>4</sup>Motivational control of retrograde amnesia: Further exploration and effects. <sup>5</sup>*Journal of Comparative & Physiological Psychology*, 1974(Feb). Vol 86(2), 187-192. <sup>6</sup>Reports 5 investigations of variables related to the motivational control of retrograde amnesia for long-term habits, which result from single electroconvulsive shock treatments. Ss were 176 Long-Evans rats. In terms of the paradigms of M.J. Robbins and D.R. Meyer<sup>7</sup>(see PA Vol 44:11961), habits that were 3rd in a series were generally resistant to the treatment and were markedly impaired if the tests for retention were carried out in changed motivational contexts. The latter result is discussed in relation to the view that long-term habits are affected by the treatments if and only if, they operate as punishments. <sup>(8)</sup> <sup>9</sup>(15 ref). <sup>10</sup>*Journal abstract.*

- 1 - Record number.
- 2 - Author(s) or editor(s). As many as four are listed, if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr., II, III, etc) are not given.
- 3 - Affiliation of first-named author/editor only.
- 4 - Article title, including subtitles: If the original article is in a foreign language, the translated title is given in brackets and the language of the original article is indicated in parentheses.
- 5 - Primary publication title and bibliographic data.
- 6 - Text of abstract.
- 7 - Reference to a previous entry in *Psychological Abstracts*. If an abstract number is unavailable at time of publication, the issue number is given. Consult the Author Index of the PA issue noted in order to determine the record number for the article.
- 8 - Summaries included in the primary publication are listed when in language(s) other than that of the article.
- 9 - Number of references is included when there are 15 or more listed.
- 10 - Abstract source.

### BOOK ANNOTATION

'8328. 'Chase, William G. ' (Ed). ' (Carnegie-Mellon U) ' Visual information processing. ' New York, N.Y. ' Academic, ' 1973. ' xiv, ' 555 p. ' \$17.50.- ' Presents a series of readings on visual processes in cognition and linguistic comprehension and on information-processing models

- 1 - Record number.
- 2 - Author(s) or editor(s). As many as four are listed; if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr , II, III, etc) are not given.
- 3 - Designation of editor.
- 4 - Affiliation of first named author/editor only
- 5 - Book title: If the book is in a foreign language, the original title is given followed by a translated title and the language of the book is indicated in parentheses.
- 6 - Place of publication
- 7 - Publisher
- 8 - Year of publication.
- 9 - Prepagination.
- 10 - Total pagination.
- 11 - Price.
- 12 - Text of annotation.

### BOOK CHAPTER CITATION

<sup>1</sup>8329. <sup>1</sup>Clark, Herbert H.; Carpenter, Patricia A. & Just, Marcel A. <sup>2</sup>(Stanford U) <sup>3</sup>On the meeting of semantics and perception. <sup>4</sup>In W.G. Chase (Ed), *Visual information processing*, New York, NY: Academic, 1973. xiv, 555 p. \$17.50.

- 1 - Record number.
- 2 - Author(s) of cited chapter. As many as four are listed; if there are more than four, the first is listed followed by "et al." Succession marks (i.e., Jr, II, III, etc) are not given.
- 3 - Affiliation of first named author only.
- 4 - Chapter title.
- 5 - Referral to the whole book and its bibliographic data.

## CONTENT CLASSIFICATION

PA has subsections for some of the 17 major classification categories. These are displayed in the Table of Contents and are designed to group all abstracts relevant to a narrower topic than the major categories under a single heading. Abstracts that are relevant to a major category but not to any of the subsections are listed first and followed by abstracts that are relevant both to a major category and also to the subsections. It is expected that this will help readers locate material related to their interests more quickly.

## ABBREVIATIONS

In addition to commonly understood abbreviations\* (including all units of measurement, educational degrees, standard statistical abbreviations, and standard Latin and reference terms), standard abbreviations used in *Psychological Abstracts* records are:

ACTH	=	adrenocorticotrophic hormone	NREM	=	nonrapid eye movement
DNA	=	deoxyribonucleic acid	REM	=	rapid eye movement
E	=	experimenter	RNA	=	ribonucleic acid
EEG	=	electroencephalogram or -graph	S	=	subject
ESP	=	extrasensory perception	TV	=	television
Exp	=	experiment	US	=	United States
IQ	=	intelligence quotient	USSR	=	Union of Soviet Socialist Republics
LSD	=	lysergic acid diethylamide	WAIS	=	Wechsler Adult Intelligence Scale
MMPI	=	Minnesota Multiphasic Personality Inventory	WISC	=	Wechsler Intelligence Scale for Children

Computer languages and computer names will also be used without definition, e.g., **ALGOL**, **COBOL**, **FORTRAN**, **IBM 360**.

Language abbreviations used after translated titles are:

Afri	= Afrikaans	Geor	= Georgian	Port	= Portuguese
Alba	= Albanian	Germ	= German	Romn	= Romanian
Arab	= Arabic	Grek	= Greek	Russ	= Russian
Bulg	= Bulgarian	Hebr	= Hebrew	Sloe	= Slovene
Chin	= Chinese	Hung	= Hungarian	Slok	= Slovak
Czec	= Czech	Iran	= Iranian	Span	= Spanish
Dan	= Danish	Ital	= Italian	Srbr	= Serbo-Croatian
Duth	= Dutch	Japn	= Japanese	Swed	= Swedish
Finn	= Finnish	Lith	= Lithuanian	Turk	= Turkish
Flem	= Flemish	Norg	= Norwegian	Ukrm	= Ukrainian
Fren	= French	Poln	= Polish	Yugo	= Yugoslavian

# PSYCHOLOGICAL ABSTRACTS

Volume 53

June 1975

Number 6

## GENERAL

10651. ———. **Guide to scientific instruments.** *Science*, 1974(Nov), Vol 186(4165-A), 162 p.—Lists laboratory instruments and equipment along with the names and addresses of their manufacturers.

10652. Adler, Helmut E.; Adler, Leonore L. & Tobach, Ethel. (American Museum of Natural History, New York, NY) **Past, present, and future of comparative psychology.** *Annals of the New York Academy of Sciences*, 1973(Dec), Vol 223, 184-192.—The history of comparative psychology is very briefly traced from its modern inception in the work of Darwin. In America, the interaction among comparative psychology, behaviorism, and ethology is discussed. The impact of ethology on comparative psychology is seen as twofold, first in its revival of the nature-nurture issue and second in its broadening of research interests to include adaptation and evolution. The history of the study of these 2 processes in American psychology is briefly summarized, emphasizing their interrelatedness. The divergence in research methodologies of the ethologists who utilize field methods and the psychologists who employ laboratory methods is discussed. Future goals and research implications of current concepts and theories are proposed. (44 ref)—R. S. Albin.

10653. Adler, Leonore L. (John Jay Coll, City U New York) **Contributions of C. Lloyd Morgan to comparative psychology.** *Annals of the New York Academy of Sciences*, 1973(Dec), Vol 223, 41-48.—Discusses the implications of C. L. Morgan's (1894) canon for comparative psychology. This canon warned against interpretation of animal behavior as due to higher thought processes when it could be understood as the outcome of lower faculties. His effect on aspects of psychology (e.g., the nature-nurture controversy and instinctive behavior) is described.

10654. Ball, G. A. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General & Pedagogical Psychology, Moscow) **[The concepts of influence, action, and operation.]** (Russ) *Voprosy Psikhologii*, 1974(Jul-Aug), No 4, 10-20.—Discusses the logic of action by defining such terms as object, system, change, and influence, action, operator, operation, operandum, and absolutely effective operation. Applications of these concepts to psychological studies are indicated. (English summary) (31 ref)—L. Zusne.

10655. Brandstaetter, Jacob & Terkel, Joseph. (Tel-Aviv U, George S. Wise Ctr for Life Sciences, Israel) **Adaptation of a double swivel for cross-transfusion.** *Behavior Research Methods & Instrumentation*, 1975(Jan), Vol 7(1), 11-14.—Describes a system, useful in behavioral, psychological, and physiological studies, for connecting a double lumen chronic heart cannula from a freely

moving laboratory animal to a pair of stationary outlets. This system allows the connection of 2 flow-ways to the blood system of a stress-free animal.

10656. Clinton, LeRoy & Arter, Judith. (U Illinois) **A computer program for the generation of Hudson's Variance Index for categorical clustering performance.** *Behavior Research Methods & Instrumentation*, 1975(Jan), Vol 7(1), 58.

10657. Connes, Bernard. (U Sherbrooke, Research Ctr of Psychomathematics, Quebec, Canada) **The use of electronic desk computers in psychological experiments.** *Journal of Structural Learning*, 1972, Vol 3(3), 51-72.—Describes a desk computer and its uses. Its advantages are its capacity of 22 positions/line, its adaptability and flexibility, the written print-out it produces, automatic feedback, automatic recording, and its ability to process the data it generates. Its limitations are the small size of the written display, a print-out in the form of numerals, its limited memory, and the delay between operations.—R. S. Albin.

10658. Cowen, Emory L.; Lorton, Raymond P. & Dorr, Darwin. (U Rochester) **Research in the community cauldron: A case history.** *Canadian Psychologist*, 1974(Oct), Vol 15(4), 313-325.—Discusses obstacles faced by community researchers, including being a "foreign body" to the system under examination; the time-consuming, longitudinal demands of studies in this area; the dangers of program instability and change; the need for community accountability; and the pro-action, anti-research orientation of many community program personnel. These hazards lead to riskier studies and to research that falls short of traditional standards of scientific rigor. It is concluded that unless investigators are willing to gamble with less precise, less well-controlled approaches, and to build knowledge through gross successive approximations, many significant, exciting problems of community psychology will not be studied. (French abstract)—*Journal abstract*.

10659. Dewsbury, Donald A. (U Florida) **Comparative psychologists and their quest for uniformity.** *Annals of the New York Academy of Sciences*, 1973(Dec), Vol 223, 147-167.—Asserts that there are many ways to conduct legitimate and important research in animal psychology. The quest for uniformity of approach is considered fruitless. The fact that this quest is frequently frustrated and then taken as failure of comparative psychology in general is criticized. Problem areas of this field are discussed, including development and causation, evolutionary history, and teleonomy. The lack of theory in comparative psychology is cited and it is suggested that this will eventually come from evolutionary theory. The selection of species for study, methods, criteria, and relationship to humans are described. The method of

diagnosing the health of comparative psychology by counting the number of species used in published journal papers is denigrated. (90 ref)—R. S. Albin.

10660. Dunlap, William P. & Duffy, John A. (Tulane U) **FORTRAN IV functions for calculating exact probabilities associated with  $z$ ,  $\chi^2$ ,  $t$ , and  $F$  values.** *Behavior Research Methods & Instrumentation*, 1975(Jan), Vol 7(1), 59-60.

10661. Eisner, Donald A.; Kosick, F. Roger & Thomas, Janet. (Lincoln Hosp, Bronx, NY) **Investigators' instructions and experimenters' misrecording of questionnaire data.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1278.—12 undergraduates were required to score questionnaire data which had been provided by other Ss. Results suggest that E misrecording effect is minimal regardless of the investigator's instructions.

10662. Firsoff, V. A. **Life and quantum physics.** *Parapsychology Review*, 1974(Nov-Dec), Vol 5(6), 11-16.—Argues against a mechanistic view of life and presents numerous examples which conform best to the assumption of some type of "ghost in the machine." (26 ref)

10663. Friedman, Richard C.; Richart, Ralph M.; Vande Wiele, Raymond L. & Stern, Lenore O. (Eds.). **Sex differences in behavior.** New York, NY: John Wiley & Sons, 1974. xvi, 495 p.—Presents a collection of 24 theoretical and empirical conference papers on sex differences in psychological functioning, physiological processes, and social systems. Topics include the effects of hormones on the development of behavior, stress and early life experience in nonhumans, early mother-child interactions in humans, gender identity and transsexualism, sex differences in aggression and adaptation, and perspectives on psychoendocrine differences.

10664. Friendly, Michael L. (York U, Toronto, Ontario, Canada) **Computer processing of free recall data: Program RECALL.** *Behavior Research Methods & Instrumentation*, 1975(Jan), Vol 7(1), 47-50.—Describes a program for comprehensive analysis of data from free-recall experiments which scores each S's recall protocols, calculates main effects and interaction means for experimental factors, and provides a variety of other analyses, such as serial position curves and probabilities of item recall. (15 ref)

10665. Gilbert, Albin R. **An essay on the history of Asian psychology.** *Psychologia: An International Journal of Psychology in the Orient*, 1974(Sep), Vol 17(3), 121-125.—Like Western psychology, Asian psychology developed a scientific methodology introspectively. Fundamental to the Eastern personality model is conscious awareness. Since Asian psychology aims at heightening and illuminating personality, it would be more appropriately called "psychagogy."—R. D. Nance.

10666. Gray, Philip H. (Montana State U) **Comparative psychology and ethology: A saga of twins reared apart.** *Annals of the New York Academy of Sciences*, 1973(Dec), Vol 223, 49-53.—Discusses, compares, and contrasts the study of behavior in the laboratory with the study of behavior in natural settings. Both comparative psychology and ethology grew out of a time and tradition that saw animal and human behavior as different in degree rather than kind. Both fields have often been utilized by the same individual, who combines both naturalism and experimentation in his

research. The definition of the terms "ethology" and "comparative psychology" have a different history from that of the content they label. While both disciplines study animal behavior, man is the central concern of both. The logical principles of the comparison of the species existed before the acceptance of the theory of evolution. Thus, despite differences, comparative psychology and ethology are also much alike. (17 ref)—R. S. Albin.

10667. Haney, Jack N.; Sewell, William R.; Edelstein, Barry A. & Sartin, Harry H. (Memphis & Shelby County Community Mental Health Ctr, Tennessee) **A portable, inexpensive, walkie-talkie-type "bug-in-the-ear."** *Behavior Research Methods & Instrumentation*, 1975(Jan), Vol 7(1), 19-20.—Describes a device for use in behavior modification training and treatment, consisting of an inexpensive walkie-talkie and a miniature earphone and plug. The advantages of the system are discussed relative to more sophisticated, expensive, and less mobile sound systems.

10668. Hartley, Alan A. (Florida International U) **A procedure and a program for the trial-by-trial identification of hypotheses in concept learning.** *Behavior Research Methods & Instrumentation*, 1975(Jan), Vol 7(1), 51-53.—Reviews techniques for tapping information processing and describes an algorithm which identifies the S's hypothesis on each trial of a concept-learning task. The algorithm operates on classifications of the entire stimulus population. A computer program has been prepared to execute the algorithm.

10669. Helmer, R. J. (Trinity U) **Modulator and filter circuits for EEG biofeedback.** *Behavior Research Methods & Instrumentation*, 1975(Jan), Vol 7(1), 15-18.—Presents inexpensive designs for 2 components of a 2-channel, signal-processing EEG biofeedback system and for various experimental configurations of this equipment suitable for student projects, demonstrations, or research.

10670. Hofmann, Richard J. (Miami U) **A program for latent partition analysis.** *Behavior Research Methods & Instrumentation*, 1975(Jan), Vol 7(1), 56.

10671. Klopfer, Peter H. (Duke U) **Does behavior evolve?** *Annals of the New York Academy of Sciences*, 1973(Dec), Vol 223, 113-119.—Questions the logic of applying evolutionary concepts to behavior changes. Similarities between organisms can be due to convergence as well as to kinship. In addition, this sort of logic assumes that there exists a highly constrained relationship between an act and the structures that subserve it. As a result, behavior is linked to genetics, at best an oversimplification. The step from structure to behavior generally entails a further loosening of the coupling between gene and end product. Thus, while little can be gained from extrapolations from one species to another, comparative psychology can be useful in specifying both the ecological factors and the evolutionary accidents that have provided the significant constraints on particular behavior patterns. Only when this has been accomplished for a wide range of species will generalizations applicable to others emerge. (20 ref)—R. S. Albin.

10672. Kreft, Lev. [Erich Fromm's theory of love.] (Sloe) *Anthropos*, 1972, No 3-4, 131-137.—Fromm's theory of love is discussed first within the framework of

Fromm's eclecticism, then within the context of dialectical materialism. It is emphasized that Fromm's premise of man's separation from nature and other people caused him to neglect the role of work, leading him to psychologism. (Slovenian & English summaries)—S. Slak.

10673. Krushinskii, L. V. (Moscow State U, Lab of the Pathophysiology of Higher Nervous Activity, USSR) **Problems of comparative psychology.** *Annals of the New York Academy of Sciences*, 1973(Dec), Vol 223, 77-83. —Describes the types of behavior studied by comparative methods. Relevant research is cited. Comparative studies concerning simple operant food reflexes show that there is no direct relationship between the latency of reflex formation, its stability, and the phyletic level of the species. Research concerning instinctive behavior has studied the evolution of building activity in birds and insects. Comparative physiological studies confirm Darwin's view of the evolution of behavior. Adaptive behavior and extrapolatory ability has been studied comparatively. Reasoning ability has been more fundamentally changed in the process of the evolution of higher nervous activity than any other behavior. This conclusion is based on studies with dogs, dolphins, monkeys, fish, reptiles, rats, and birds. Thus, comparative psychology has produced much data elucidating the general rules of the evolution of various features of behavior. (47 ref)—R. S. Albin.

10674. Lapointe, Francois H. (Tuskegee Inst) **A selected bibliography on the existential and phenomenological psychology of G. Marcel & Paul Ricoeur.** *Journal of Phenomenological Psychology*, 1973(Fal), Vol 4(1), 363-373.

10675. Le Unes, Arnold. (Texas A&M U) **Contributions to the history of psychology: XIX. A review of selected aspects of texts in child psychology.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1291-1298. —A review of 16 child psychology textbooks indicates that (a) 96 journal articles published prior to 1950 were cited in 3 or more texts; (b) these articles were found in various journals, although 2 dominated; (c) articles by "classical" authors were included; and (d) there was variation in reverence for the past and for bibliography. (17 ref) —Journal abstract.

10676. Le Unes, Arnold. (Texas A&M U) **Contributions to the history of psychology: XX. A review of selected aspects of texts in abnormal psychology.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1319-1326. —A review of 12 textbooks indicates that (a) certain journals dominated in publishing "classic" articles, with  $\frac{1}{2}$  of them originating from medical or psychiatric publications; (b) children's disorders and functional psychoses were prominent themes; (c) texts varied in their treatment of developments in abnormal psychology; and (d) certain texts included more of the "classics" than others. (18 ref)—Journal abstract.

10677. Lifton, Robert J. **On death and the continuity of life: A "new" paradigm.** *History of Childhood Quarterly: The Journal of Psychohistory*, 1974(Spring), Vol 1(4), 681-696. —Based on *Death in Life*, the author's studies of Hiroshima, a new paradigm of human behavior is proposed: a process of "psychic numbing" as a consequence of modern technological violence and

absurd death. The Freudian (Victorian era) paradigm of repression of sexuality is contrasted with the overwhelming difficulties surrounding death that confront modern man. Psychic numbing contributes to the cessation of the "formative process," the impairment of man's essential mental function of symbol-formation or symbolization. These concepts are then applied to a constellation of psychological issues such as mental disturbance. (1 p ref) —J. Carlson.

10679. Martin, Garry L. (U Manitoba, Winnipeg, Canada) **Varieties of behavior modification: A comment.** *Canadian Psychologist*, 1974(Oct), Vol 15(4), 378-381. —Argues that there is more than one version of what behavior modification is all about. The different versions can be considered in terms of a continuum of partially overlapping historical ties and identities. Any discussion of an identity for behavior modification without clarifying which version is being discussed may be misleading and unfair to particular brands of behavior modification. (French abstract)—Journal abstract.

10680. Noble, Clyde E. (U Georgia) **Philosophy of science in contemporary psychology.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1239-1246. —Argues that behavioral scientists should be principally engaged in performing inductions, deriving deductions, and formulating and testing hypotheses. Adopting Peircean terminology, the activities of induction, deduction, and abduction are analyzed and interrelated. It is suggested that the development of psychology might be accelerated by paying more attention to the hypothetical nature of scientific knowledge.—Journal abstract.

10681. Pecter, Richard. (Dartmouth Coll) **Subroutine for generating all permutations of N integers.** *Behavior Research Methods & Instrumentation*, 1975(Jan), Vol 7(1), 57.

10682. Pfaffmann, Carl. (Rockefeller U, New York, NY) **The comparative approach to physiological psychology.** *Annals of the New York Academy of Sciences*, 1973(Dec), Vol 223, 57-64. —Asserts that the physiological approach to the study of the mechanisms that underlie behavior has been too little influenced by the comparative method. This may be due to the effect of neurophysiology on physiological psychology in that neurophysiological methods select animals to study on the basis of convenience, availability, cost, and relevant technology. Another tendency in physiological psychology is the attempt to study pure, uncontaminated stimuli instead of natural ones. Higher levels of complex organization are thus missed. The main thrust of traditional physiological psychology has been to search out commonalities, to somehow gloss over differences, and to delineate similarities. The comparative approach contrasts with this in its emphasis on both similarities and differences in behavior and physiology. The traditional approach thus ignores the usefulness inherent in a broader and comparative analysis.—R. S. Albin.

10683. Pieper, William J. & Pinkus, Allen L. (Applied Science Assoc. Denver, CO) **Computer-generated troubleshooting trees: The program.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 180-181.

10684. Plitz, Gordon F. (Southern Illinois U, Carbonale) **Building a programming language for a small computer: Reinventing the wheel.** *Behavior Research Methods & Instrumentation*, 1975(Jan), Vol 7(1), 42-46.—Describes SP-12, a language for a PDP-12 computer, showing how a special-purpose language can be constructed from a set of machine-language subroutines that are called by a simple interpreter. Preliminary translation of the source program into binary code, using an assembler, greatly increases the speed of the interpreter.

10685. Rogo, D. Scott. **Demonic possession and parapsychology.** *Parapsychology Review*, 1974(Nov-Dec), Vol 5(6), 18-24.—Surveys selected possession cases and lists features commonly present. These include such parapsychological phenomena as levitation and the ability to use unlearned languages. The vicious and violent psychokinetic and ESP manifestations make it doubtful that the phenomenon is a conventional poltergeist, or any other general manifestation of psychic ability, or due to suggestion. Although all these possible explanations are related to possession, they do not fit the facts as well as a demonic theory. (23 ref)—P. F. Grim.

10686. Rose, Steven P. & Rose, Hilary. (Open U, Bletchley, England) **"Do not adjust your mind, there is a fault in reality": Ideology in neurobiology.** *Cognition*, 1973, Vol 2(4), 479-502.—Discusses the possible sources of ideological input into science in general and examines a particular group of sciences neurobiology, for evidence of the role of ideology. Reductionist ideology in neurobiology, in particular, is explored. (French summary) (45 ref)

10687. Rus, Vojan. [Fromm's and Scheler's anthropology.] (Sloe) *Anthropos*, 1972, No 3-4, 103-130.—Discusses similarities and differences between E. Fromm's and V. M. Scheler's philosophies of man, including problems related to psychology. (Slovenian & English summaries)

10688. Russell, Roger W. (Flinders U South Australia, Bedford Park) **On the definition of comparative psychology.** *Annals of the New York Academy of Sciences*, 1973(Dec), Vol 223, 54-56.—Proposes a new terminology to describe the subject matter of comparative psychology that refers to genetically coded behaviors and to environmental conditions that activate similar processes. The applicability of concepts studied comparatively to human behavior is discussed. The existence of a field of study entitled comparative psychology is asserted. (17 ref)

10689. Schoenfeld, W. N. & Cole, B. K. (Queens Coll, City U New York) **What is a "schedule of reinforcement"?** *Pavlovian Journal of Biological Science*, 1975(Jan-Mar), Vol 10(1), 52-61.—Discusses the term "schedule of reinforcement." 2 distinguishable operational rules are implicated in the term: In the case where reinforcement is of the so-called response contingent type, the "schedule" is really a rule to identify the response to be reinforced. In the case of noncontingent reinforcement, the "schedule" is truly a rule for delivery

of reinforcement. Other terminological ambiguities discussed are "reinforcement" and "intermittency." A resolution of these problems will necessarily involve the procedures of noncontingent reinforcement and the parameter of reinforcement probability.—*Journal abstract.*

10690. Schwanenber, Enno & Huth, Wolfgang. (U Frankfurt, W Germany) [The relevance of experimental non-zero-sum games.] (Germ) *Zeitschrift für Sozialpsychologie*, 1974, Vol 5(3), 167-183.—Discusses the relevance of experimental social psychology, using the non-zero-sum game as a paradigm. The games of Prisoner's Dilemma, Chicken, and Maximizing Differences are described. Different approaches and conceptualizations of economic-mathematical game theory and social-psychological game research are explored with reference to the dilemma of individual vs collective rationality. The utility that the players assign to the features of the game is crucial for interpreting the effects of both organismic and situational variables. The question of relevance is discussed in terms of recognizing and evaluating theory and method in social psychology. (40 ref)—*English abstract.*

10691. Scott, J. P. (Bowling Green State U, Ctr for Research on Social Behavior) **The organization of comparative psychology.** *Annals of the New York Academy of Sciences*, 1973(Dec), Vol 223, 7-40.—The principal function of comparative psychology is to establish the generality of behavioral phenomena. This approach enables one to ascertain those processes or qualities that are basic and important to all life. It is suggested that this methodology has been perverted, a perversion somewhat explained by the history of its use in psychology. The period from 1890 to modern times is described from this viewpoint. 2 trends are discerned: (a) the tendency to dichotomize social factors and to insist that there are only 2 classes of causes, when the possibility exists that there are many classes; and (b) the tendency to insist that theoretical causal factors are mutually exclusive, when they are obviously mutually interactive. The major drawback to subdivisions of comparative psychology (e.g., behavior genetics and comparative social psychology) is the artificiality and arbitrariness they engender in research. However, both comparative evolutionary and developmental psychology can be seen as unifying. The latter is explicated through a description of the development of behavior in the dog. Sensory, motor, learning, and patterned behavior are reported. (111 ref)—R. S. Albin.

10693. Stacey, William D.; Weissmuller, Johnny J.; Barton, Bruce B. & Rogers, C. R. (US Air Force Human Resources Lab, Lackland, TX) **CODAP: Control card specifications for the UNIVAC 1108.** *US AFHRL Technical Report*, 1974(Oct), No 74(84), 204 p.—Presents control card writeups for the 34 main programs in the UNIVAC 1108 version of CODAP, a highly interactive system of computer routines for analyzing, organizing, and reporting occupational information.

10694. Stewart, Robert A. (Massey U, Palmerston North, New Zealand) **States of human realization: Some physiological and psychological correlates.** *Psychologia: An International Journal of Psychology in the Orient*, 1974(Sep), Vol 17(3), 126-134.—Defines the basic purpose of all psychotherapy as the maximization of human happiness. Systems for promoting self-realization have come from both the West and the East. 2 Eastern systems, in the Zen tradition and the Hindu Yoga meditative tradition, are attracting interest in the West. Some of the physiological, psychological, and social research on transcendental meditation are examined. Recent work in training people to produce subjective states of mind, and some of the correlates of states of "human realization," are discussed. (33 ref)—R. D. Nance.

10695. Tack, Werner H. (U Saarlandes, W Germany) **[Two theorems on the construction of three-person games with nonempty core.]** (Germ) *Zeitschrift für Sozialpsychologie*, 1974, Vol 5(3), 184-188.—Discusses assumptions necessary to test deviations of actual behavior from that defined by game theory as rational behavior in 3-person games. Theoretical assumptions about rational behavior in the division of winnings are offered, and the necessary and sufficient conditions for the construction of games testing these assumptions are specified.—*English abstract.*

10696. Tarbox, Raymond. **Exhaustion psychology and Sartre's *The age of reason*.** *American Imago*, 1973(Spring), Vol 30(1), 80-96.—Describes characteristics of "scream-boomerang-exhaustion literature": The Omnipotent Scream of Rage, The Boomerang of One's Never Silenced Scream of Rage, The Exhausted Body, and The Torporous World of the Fetal Hero. A number of examples from contemporary fiction are cited. In particular, the characters and events of J. P. Sartre's *The Age of Reason* are examined and interpreted in the light of these ideas. Mathieu, the central figure, is "an individual left waiting," unable to make a commitment to any destiny. As a "scream hero" under great exhaustion he is incapable of identifying with the treacherous and time-controlling and exhausting mother or father. The other persons in the book are discussed in the light of Mathieu's self-destructiveness.—R. S. Albin.

10697. Turnbull, Allen A. (Carleton U, Ottawa, Ontario, Canada) **Replication in psychology, or If it happens once, will it happen again?** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 179.

10698. Tyler, C. William & Raibert, Marc. (Northeastern U) **Generation of random-dot stereogratings.** *Behavior Research Methods & Instrumentation*, 1975(Jan), Vol 7(1), 37-41.—Stereogratings are an extension of periodic stimulation to the Cyclopean domain (a method of stereoscopic presentation of stimuli in the absence of corresponding monocular information). A program for the generation of random-dot stereogratings is described, with discussion of the advantages and disadvantages of the program.

10699. Virsu, Veijo & Lehtio, P. K. (U Helsinki, Finland) **A microphotometer for measuring luminance distributions on a CRT.** *Behavior Research Methods & Instrumentation*, 1975(Jan), Vol 7(1), 29-33.—Notes that cathode-ray tubes (CRTs) are convenient devices for

producing well-controlled visual stimuli for varying the spatial or temporal features of the stimulus. A relatively inexpensive microphotometer is described for use in conjunction with a CRT to obtain calibrations required in psychophysical and physiological experiments and in which the spectral sensitivity can be corrected to approximate that of the human photopic eye.

10700. Voyat, Gilbert. (City Coll, City U New York) **The work of Henri Wallon.** *International Journal of Mental Health*, 1972-1973(Win), Vol 1(4), 4-23.—Discusses Wallon's fundamental contribution to the development of theories concerning imitation, emotions, and syncretic thought in the child, with special attention to the controversies between Wallon and J. Piaget. The relevance of Wallon's global and coherent perspective within psychoanalytical, phenomenological, and purely cognitive points of view; the significance of the extensive range of his work from pathological to sophisticated philosophical and epistemological problems; his emphasis on development in its ontogenic and phylogenetic aspects and his belief that knowledge and reality, intelligence and emotions are a result of external and internal processes; and finally, his emphasis on a social ethic for psychology, are all discussed to explain his influence on psychologists and philosophers, especially Marxist ones. (24 ref)—A. H. Alawi.

10701. Wallon, Henri. **Psychology and dialectical materialism.** *International Journal of Mental Health*, 1972-1973(Win), Vol 1(4), 75-79.—Contends that dialectical materialism provides the normal base and guiding principles for the science of psychology. Marxist dialectics have made psychology a natural and human science and have enabled it to comprehend the organism and its ever-changing environment as a single, unified whole in constant interaction. The division between consciousness and things that spiritualism has sought to impose on the universe has been abolished, and Marxist dialectics provides psychology with a tool for explaining and studying individual behavior.—A. H. Alawi.

10702. Welford, A. T. (Ed.). (U Adelaide, SA, Australia) **Man under stress.** New York, NY: John Wiley & Sons, 1974. 140 p. \$10.95.

10703. Wiesensthal, David L. (York U, Downsview, Ontario, Canada) **Reweaving deception's tangled web.** *Canadian Psychologist*, 1974(Oct), Vol 15(4), 326-336.—Reviewed recent trends in social psychological research toward greater use of field settings and unobtrusive measurement. 4 major issues relating to this problem were identified: (a) the general public may be more intolerant of being used as research Ss than are college students; (b) disguised observation may tend to aggravate a post-Watergate concern over invasion of privacy; (c) greater harm to participants in some field research may be likely because laboratory control is greatly lacking; and (d) because concern with revealing social psychology data to the public may jeopardize future research, scant feedback is provided to participants. (French abstract) (33 ref)—*Journal abstract.*

10704. Williams, David B. & Shelton, Chris. (South West Regional Lab for Educational Research & Development, Los Alamitos, CA) **A procedure and instrumentation for presenting luminous numeric response cues in a nonverbal auditory serial position task.** *Behavior*

*Research Methods & Instrumentation*, 1975(Jan), Vol 7(1), 23-25.—Describes the experimental use of a luminous numeric display to generate response cues in a forced-choice recall task for nonverbal auditory (pitch) sequences. A description of the response cue display (RCD) constructed for this purpose and triggered by a 3-bit binary configuration of sine-wave logic tones is included.

10705. Wong, Paul T.-P.; Roach, Tom & Osborne, Bruce. (Trent U, Peterborough, Ontario, Canada) **A sand-digging apparatus for rats.** *Behavior Research Methods & Instrumentation*, 1975(Jan), Vol 7(1), 34-36.—Describes an apparatus which permits automatic recording of the topography of sand digging. Research carried out to evaluate the apparatus indicates that time in sand contact was better correlated with the amount of sand displaced than frequency of contact and that a sand-and-iron-filing mixture had no suppressive effect on sand digging as compared to normal sand.

10706. Zeigler, H. P. (Hunter Coll, City U New York) **The problem of comparison in comparative psychology.** *Annals of the New York Academy of Sciences*, 1973(Dec), Vol 223, 126-134.—Describes 2 rationales for the scientific study of animal behavior. One rationale is that since all living things are phylogenetically related, animals may be justifiably studied in the hope that they will clarify the causal mechanisms that underlie supposedly homologous behaviors in man by the fact that these animals exhibit human structural or functional patterns in considerably less complex form. Often then, the behavior of animals is of interest only insofar as they exemplify human processes such as learning, memory, or aggression. The 2nd rationale views the evolutionary process as having produced an almost endless series of variations upon relatively few basic themes. Thus, the use of this approach in research results in the study of the similarities and differences among species—the study of comparative psychology. The research and theoretical implications of these 2 methodologies are detailed. (20 ref)—R. S. Albin.

## PSYCHOMETRICS AND STATISTICS

10707. Bakeman, Roger; Helmreich, Robert & Wilhelm, John. (U Texas, Austin) **The Life History Questionnaire (LHQ): II. Description and applications.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 127.

10708. Fee, F. (Belfast Education & Library Board, Northern Ireland) **An analysis of two diagnostic tests: The Frostig and the I.T.P.A.** *Irish Journal of Psychology*, 1974(Win), Vol 2(3), 176-182.—Factor analyzed data presented by the respective authors of the Frostig Developmental Test of Visual Perception (DTVP) and the Illinois Test of Psycholinguistic Abilities (ITPA), using a method described by F. Fee (1973). Results indicate that while the structure of the DTVP conforms to its reported claims, this cannot be said of the ITPA.—*Journal abstract.*

10709. Holt, Robert R. (New York U, Research Ctr for Mental Health) **Clinical and statistical measurement and prediction: How not to survey its literature.** *Catalog*

*of Selected Documents in Psychology*, 1975(Win), Vol 5, 178-179.

10710. Seidenstücker, Gerhard & Seidenstücker, Ellen. (U Regensburg, W Germany) **[Contributions to a computer evaluation of the Thematic Achievement Motivation Test by Heckhausen.]** (Germ) *Psychologische Beiträge*, 1974, Vol 16(1), 68-92.—Reviews the present state of research on computer scoring of H. Heckhausen's test. The correlation between the scoring by experts and computer on the test variable Hope of Success was .78 and on Fear of Failure was .53. Needed improvements in present computer programs are discussed with special reference to the linguistic approach of generative semantics. (French summary) (30 ref)—*English summary.*

10711. Shalit, Benjamin. **Type of display of assessment scales and distribution of responses.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1100-1102.—Ss marked their assessment of a neutral and of an emotionally loaded question on identical scales, 2 vertical and 2 horizontal, with the 0-point at top, bottom, right, or left. The distribution of responses to the emotional question was significantly greater on a vertical scale with the 0-point at the top and is discussed in terms of scanning as affected by anchor point.

## Test Construction & Validation

10712. Heim, A. W.; Watts, K. P. & Simmonds, V. (U Cambridge, Psychological Lab, England) **AH 2 and AH 3: Parallel tests of reasoning.** *British Journal of Psychology*, 1974(Nov), Vol 65(4), 493-503.—Discusses tests AH 2 and AH 3, group tests of reasoning with several features usually associated with individual tests of intelligence. In the course of standardizing the 2 tests, several widely accepted findings have been confirmed, notably male superiority on numerical questions, female superiority on verbal questions, and the greater variance found generally among males than females. 2 further results are also noted: (a) the data do not support the suggestion, often made by teachers and other educationists, that girls tend to excel boys around 10-12 yrs of age owing to their earlier physical and mental maturation—to be rejoined, or surpassed, by the boys in their early teens; (b) it seems well worth while incorporating pictorial items in a group test of reasoning, intended to cover a wide age range. It is suggested that this type of item enables the younger (and the less able) to show their strength in an area usually neglected in group tests, and it proves to be a task in which they delight.—*Journal abstract.*

10713. Holm, Kurt. **[Theories of question batteries.]** (Germ) *Kölner Zeitschrift für Soziologie und Sozialpsychologie*, 1974(Jun), Vol 26(2), 316-341.—Presents a model of question batteries and discusses their theoretical aspects. (16 ref)

10714. Jäger, Reinhold. (Otto-Selz-Inst für Psychologie und Erziehungswissenschaft, Staudenweg, W Germany) **[Observations on the standard scale of critical differences.]** (Germ) *Diagnostica*, 1974, Vol 20(4), 165-168.—Examines "differentiability," a criterion to evaluate tests to be used in conjunction with objectivity, reliability, and validity. "Differentiability" refers to the number of meaningful cut-off points of a scale. It is a function of the type of reliability considered and of the

stability of this reliability across different populations and subpopulations exhibiting different scores on the scale to be evaluated.—*M. Morf.*

10715. **Johansson, Charles B.** (National Computer Systems, Edina, MN) **Strong Vocational Interest Blank in-general samples.** *Journal of Counseling Psychology*, 1975(Mar), Vol 22(2), 113-116.—Throughout the history of the Strong Vocational Interest Blank (SVIB), the aggregation of "in-general" samples to represent an "average" has been of concern because an adequate in-general sample is necessary for the development of valid occupational scales for the SVIB. 6 in-general samples have been generated over the years to fit different developments of the SVIB. In the present study 20 experimental homogeneous scales were used to measure the similarities and differences among the 6 in-general samples. Generally, all samples were strikingly similar, with the greatest differences appearing between male and female in-general samples.—*Journal abstract.*

10716. **Kristof, Walter.** (U Hamburg, Seminar für Sozialwissenschaften, W Germany) **Estimation of reliability and true score variance from a split of a test into three arbitrary parts.** *Psychometrika*, 1974(Dec), Vol 39(4), 491-499.—Presents a method of estimating the reliability of a test which has been divided into 3 parts. The parts do not have to satisfy any statistical criteria like parallelism or  $\tau$ -equivalence. If the parts are homogeneous in content (i.e., if their true scores are linearly related and if sample size is large) then the method will give the precise value of the reliability parameter. If the homogeneity condition is violated then underestimation will typically result. However, the estimate will always be at least as accurate as coefficient  $\alpha$  and L. Guttman's (1945) lower bound  $\lambda_1$  when the same data are used. An application to real data is presented by way of illustration. 7 different splits of the same test are analyzed. The new method yields remarkably stable reliability estimates across splits as predicted by the theory. One deviating value can be accounted for by a certain unsuspected peculiarity of the test composition. Both coefficient  $\alpha$  and  $\lambda_1$  would not have led to the same discovery.—*Journal abstract.*

10717. **Kroger, Rolf O. & Turnbull, William.** (U Toronto, Ontario, Canada) **Invalidity of validity scales: The case of the MMPI.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 48-55.—Tested the hypothesis that Ss fake personality tests by enacting a specific social role, rather than by responding in terms of personality constructs, and that such role faking cannot be detected by validity scales. In Exp I, 22 male undergraduates were able to reproduce without detection the MMPI profile of an Air Force officer but not that of a creative artist. The latter was attributed to the Ss' inaccurate conception of the artist role. However, when 10 of 21 Ss in Exp II were given an accurate conception of the artist role, they succeeded in reproducing the MMPI artist profile without detection as well. Results favor the hypothesis, provided that the Ss possess an accurate conception of the role to be simulated. (17 ref)—*Journal abstract.*

10718. **MacDonald, A. P.** (West Virginia U) **Instrumental and terminal values: Some new developments.**

*Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 123.

10719. **Smith, Kent W.** (Princeton U) **Forming composite scales and estimating their validity through factor analysis.** *Social Forces*, 1974(Dec), Vol 53(2), 168-180.—Suggests that when forming a scale through factor analysis and evaluating it with D. R. Heise and G. W. Bohrnstedt's (1970) validity index, rho, the factor analysis should include the indicators of only one construct. If these variables are optimally weighted through least-squares regression, rho is the multiple correlation of the factor with the measured variables. An often tenuous assumption underlies the use of rho to correct a scale's correlations for invalidity and error. Although useful, rho is not a substitute for external validation. Maximizing rho is a better criterion for selecting weights of variables than is maximizing Heise and Bohrnstedt's reliability index. (22 ref)—*Journal abstract.*

### Mathematical Models & Statistics

10720. **Bernhardson, Clemens S.** (U Saskatchewan, Saskatoon, Canada) **Probability of Type I error for pairwise comparisons between ordered means.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 113.

10721. **Bernhardson, Clemens S.** (U Saskatchewan, Saskatoon, Canada) **Empirical Type 1 error rates for two methods of testing simple main effects.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 179-180.

10722. **Berry, Kenneth J.; Martin, Thomas W. & Olson, Keith F.** (Colorado State U) **Testing theoretical hypotheses: A PRE statistic.** *Social Forces*, 1974(Dec), Vol 53(2), 190-196.—Departures from statistical independence are conjoined with an assessment of predictive accuracy in a coefficient of association for nominal-level  $2 \times 2$  contingency tables which is both interpretable as a proportional reduction in error (PRE) measure and consistent with research hypotheses of manifold forms. Measurement assumptions and operating characteristics of the measure, which is termed K, are delineated, definitional and computational formulae are derived from classical probability theory, comparisons with other relevant statistics are made, and the test of significance is shown to be the traditional chi-square test.—*Journal abstract.*

10723. **Cotton, John W.** (U California, Santa Barbara) **Implications of two local consistency strategy selection models.** *Journal of Mathematical Psychology*, 1974(Nov), Vol 11(4), 364-390.—Examines mathematical implications of 2 process models of concept identification, the 1-element strategy selection model with a local consistency assumption and J. Chumbley's (see PA, Vol 44:3102) hypothesis manipulation (HM) model. Under slightly restrictive assumptions, each process model (Level 1) is shown to imply a stochastic model (Level 3), making predictions of behavior in experimental situations in which the stimulus presented to an S on any trial is randomly selected and independent of that presented on any other trial. In addition, each model makes predictions at an intermediate level (Level 2) about performance on successive trials with specific stimulus sequences

presented. At Level 2, each model falsely predicts zero probabilities for particular response patterns when stated stimulus sequences are used. Fewer such problems arise with the HM than with the 1-element model. Minimum squared error fits of 1 set of experimental data show relatively good correspondence of predictions and observations when a Chumbley model with different saliences for different hypotheses is employed. (21 ref)—*Journal abstract*.

10724. Cramer, Elliot M. (U North Carolina) **The relation between Rao's paradox in discriminant analysis and regression analysis.** *Multivariate Behavioral Research*, 1975(Jan), Vol 10(1), 99-107.—C. R. Rao (1952) has commented on an apparent paradox in discriminant analysis in which 2 variables discriminate the groups when used separately but not when used in combination. It is shown that there is an exact relationship between this and the paradoxes in regression analysis. An expression for the  $F$  statistic in discriminant analysis is given in terms of the average of squares of  $t$  values to clarify this relationship.—*Journal abstract*.

10725. Cunningham, James P. & Shepard, Roger N. (U California, San Diego) **Monotone mapping of similarities into a general metric shape.** *Journal of Mathematical Psychology*, 1974(Nov), Vol 11(4), 335-363.—Describes and tests a method of maximum variance nondimensional scaling that transforms similarity measures into distances that meet just 3 conditions: (a) they exactly satisfy the metric axioms; (b) they are, as nearly as possible, monotonically related to the similarity measures; and (c) they have maximum variance possible under the 2 preceding conditions. By achieving an appropriate balance between the last 2 conditions, one can determine the true underlying distances and the form of the unknown monotone function relating the similarity measures to those distances without assuming that the underlying space has any particular Euclidean, Minkowskian, or even dimensional structure. The method appears to have potential applications to studies of stimulus generalization and the structure and processing of semantic information. (42 ref)—*Journal abstract*.

10726. Doignon, J. P. & Falmagne, J. C. (U Brussels, Belgium) **Difference measurement and simple scalability with restricted solvability.** *Journal of Mathematical Psychology*, 1974(Nov), Vol 11(4), 473-499.

10727. Dudziński, M. L.; Norris, J. M.; Chmura, J. T. & Edwards, C. B. (Commonwealth Scientific & Industrial Research Organization, Canberra, ACT, Australia) **Repeatability of principal components in samples: Normal and non-normal data sets compared.** *Multivariate Behavioral Research*, 1975(Jan), Vol 10(1), 109-117.—Demonstrates, using arguments based on Monte Carlo methods, that if there is enough meaningful structure in the population, then principal components analysis (PCA) of samples of behavior data with multivariate nonnormal distribution may provide answers relative to the "true" population principal components of comparable reliability to PCA of samples of multivariate normal data.

10728. Fishburn, Peter C. & Gehrlein, William V. (Pennsylvania State U) **Alternative methods of constructing strict weak orders from interval orders.** *Psychometrika*, 1974(Dec), Vol 39(4), 501-516.—Proposes

es to let  $n$  stimuli be linearly ordered by a physical attribute and to consider that an individual's "more than" relation be based on perceived attribute values. Assuming that the individual's relation agrees with the linear order and is an interval order, the present study examines the extent to which ordered pairs in the linear order but not in the interval order (due to nondetection of "small" differences) can be correctly identified on the basis of the interval order alone. Different methods of constructing strict weak orders from interval orders are compared by the degree of agreement with the underlying linear order. (15 ref)—*Journal abstract*.

10729. Hakstian, A. (U British Columbia, Vancouver, Canada) **Brief report: Asymmetric simplicity criteria for orthogonal factor transformation.** *Multivariate Behavioral Research*, 1975(Jan), Vol 10(1), 119-125.—Discusses the notion of column simplicity in a factor pattern matrix and shows that the varimax procedure is only one way of operationalizing this notion. A general central-moment simplicity criterion is introduced, and the special cases of this formulation that indicate asymmetry are shown to have logical appeal in a constraint-free factor transformation context. Results of implementing these criteria with data, however, suggest that, in the case of orthogonal rotation, the considerable constraints render solutions based on various special cases of the general criterion quite similar to one another.—*Journal abstract*.

10730. Hakstian, A. Ralph & Abell, Robert A. (U British Columbia, Vancouver, Canada) **A further comparison of oblique factor transformation methods.** *Psychometrika*, 1974(Dec), Vol 39(4), 429-444.—4 prominent oblique transformation techniques—promax, C. W. Harris and H. F. Kaiser's (see PA, Vol 39:9008) procedure, biqurtamin, and direct oblimin—are examined and compared. Additionally, 2 newly developed procedures, falling into the category designated as Case III by Harris and Kaiser, are presented and included in the comparisons. The techniques are compared in light of their freedom from bias in the interfactor correlations and in their ability to yield clear simple structures, over many data sets—some constructed and some real—varying widely in terms of number of variables and factors, factorial complexity, and clarity of the hyperplanes. Results are discussed, and implications for practice are noted.—*Journal abstract*.

10731. Hoffmann, Gisbert. [Comparison of rank ordering by instructors and by participants at the officers training school, Hamburg.] (Germ) *Zeitschrift für Experimentelle und Angewandte Psychologie*, 1974, Vol 21(4), 546-563.—During the last session of an officer training course 18 instructors and 412 students each ranked all participants in the course, producing 766 rank orders. Correlations between the rank order of the instructor and the mean of the participants resulted in Spearman  $r_s$  of .86 and a Kendall coefficient of  $w = .705$ . The correlation  $r_s$  was independent of the number of participants and relatively independent of the instructor. (English & French summaries)—W. J. Koppitz.

10732. Hofmann, Richard J. (Miami U) **The computation of regression estimate factor scores for singular and nonsingular data.** *Behavior Research Methods & Instrumentation*, 1975(Jan), Vol 7(1), 56.

10733. Hubert, Lawrence. (U Wisconsin) **A note on Freeman's measure of association for relating an ordered to an unordered factor.** *Psychometrika*, 1974(Dec), Vol 39(4), 517-520.—Within the context of a contingency table, the relationship between L. C. Freeman's (1965) measure of association  $\theta$  and the asymmetric association measures developed by R. H. Somers (see PA, Vol 38:1579) is described. The  $\theta$  coefficient is appropriate for a contingency table in which the levels of one factor are ordered and the levels of the other factor are unordered; the indices defined by Somers are usually used when the levels of both factors are ordered, and one is assumed to be the independent factor.—*Journal abstract.*

10734. Hunter, John E. & Cohen, Stanley H. (Michigan State U) **Correcting for unreliability in nonlinear models of attitude change.** *Psychometrika*, 1974(Dec), Vol 39(4), 445-468.—Briefly discusses the problems in testing nonlinear models of attitude change. The regression artifacts produced by unreliability are shown in both the linear and nonlinear case. Classical solutions for the linear case are reviewed, and a new solution to the linear case is presented and applied to the nonlinear case. It is shown to work well under a broad set of conditions. Regression artifacts in bivariate regression are discussed. If the predictors are independent, then the univariate correction procedure can be applied to each predictor separately. If the predictors are correlated, a joint correction procedure must be used. One such procedure is defined and shown to work perfectly in the case of linear regression and reasonably well in a broad set of conditions in which the regression is nonlinear.—*Journal abstract.*

10735. Jaffray, Jean-Yves. (U Paris VI, France) **On the extension of additive utilities to infinite sets.** *Journal of Mathematical Psychology*, 1974(Nov), Vol 11(4), 431-452.—Independence condition C is known as necessary and sufficient for the existence of an additive utility on a finite subset  $X$  of a Cartesian product. In the present paper, a stronger necessary condition,  $H$ , interpreted as both an independence and Archimedean condition, is derived. It is shown to be sufficient when  $X$  is countable by constructing an additive utility as the limit of a sequence of additive utilities on finite subsets of  $X$ . When  $X$  is not countable, but is a Cartesian product, another necessary condition, the existence of  $A$ , a countable perfectly (order-) dense subset of  $X$ , is added to  $H$ ; an additive utility is constructed by extension to  $X$  of an additive utility on a countable set linked to  $A$ . An application to a no-solvability case is given. (17 ref) —*Journal abstract.*

10736. Joe, George W. & Woodward, J. Arthur. (Texas Christian U) **An approximate confidence interval for maximum coefficient alpha.** *Multivariate Behavioral Research*, 1975(Jan), Vol 10(1), 93-98.—Develops an approximate confidence interval for the maximum coefficient alpha reliability of a scale where the scale is considered fixed and persons are sampled. The interval requires the assumption that the items of the scale are multivariate normally distributed, and use of the interval estimate is not encouraged in cases where the assumption of multivariate normality is not warranted.—*Journal abstract.*

10737. Kaiser, Henry F. & Horst, Paul. (U California, Berkeley) **A score matrix for Thurstone's box problem.** *Multivariate Behavioral Research*, 1975(Jan), Vol 10(1), 17-25.—Since the score matrix for L. L. Thurstone's (1947) classic 20-variable box problem contains no measurement error and also generates a singular correlation matrix, a new score matrix for this problem, both containing measurement error and having enough entities to yield a nonsingular correlation matrix, is developed. Various interesting statistics for the new data are given, and an extended vector projection for the new data is shown. The new score matrix should be of use for work in factor-analytic methodology.—*Journal abstract.*

10738. Kalleberg, Arne L. & Kluegel, James R. (U Wisconsin, Madison) **Analysis of the multitrait-multimethod matrix: Some limitations and an alternative.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 1-9.—Discusses the multitrait-multimethod (MTMM) matrix which is widely used by researchers in applied psychology to assess the convergent and discriminant validity of constructs. A path analytic conceptualization of MTMM matrix analysis shows that the appropriateness of the inferences drawn on the basis of this method is heavily dependent upon the extent to which its underlying assumptions are fulfilled. To test these assumptions, as well as to interpret the relationships in the MTMM matrix, it is recommended that a confirmatory factor analytic model be used. This technique is illustrated by a reanalysis of J. Wanous and E. Lawler's (see PA, Vol 48:7988) MTMM matrix; the reanalysis shows how faulty inferences were drawn due to a violation of the assumptions underlying the matrix.—*Journal abstract.*

10739. Kneppreth, Norwood P.; Gustafson, David H.; Leifer, Richard P. & Johnson, Edgar M. (U Wisconsin) **Techniques for the assessment of worth.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 180.

10740. Laming, Donald. (U Cambridge, Psychological Lab, England) **The sequential nature of the quantal experiment.** *Journal of Mathematical Psychology*, 1974(Nov), Vol 11(4), 453-472.—Proposes a linear model for the interrelation of successive responses in the quantal experiment. The model is based on a direct mechanism of response linkage rather than on an indirect relation by means of fluctuations in sensitivity, because U. Neisser's (see PA, Vol 33:2915) published results implicate the former mechanism rather than the latter. The proportion of increments detected is an unbiased estimator of the detection probability and has a statistical efficiency of only 20%. In view of this unexpectedly low efficiency it is possible that rectilinear psychometric results have occurred by means of a biased, but unwitting, selection of data. (21 ref)—*Journal abstract.*

10741. Lienert, G. A. & Krauth, J. (U Düsseldorf, Inst for Psychology, W Germany) **[Configural frequency analysis: VIII. Evaluation of multivariate factorial designs.]** (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1973, Vol 21(4), 298-311.—Presents the 8th part of a series of articles on the theory and techniques of configural frequency analysis (CFA). How CFA can be modified for the purpose of evaluating multivariate factorial designs is explained. The suggested

procedure results in a nonparametric substitute for multivariate analysis. If repeated measurements from each patient are taken in each variable, they may be represented by trend configurations and evaluated in the same manner as single measurements. (English summary)—*T. Fisher.*

10742. Lingoes, James C. & Schönemann, Peter H. (U Michigan) **Alternative measures of fit for the Schönemann-Carroll matrix fitting algorithm.** *Psychometrika*, 1974(Dec), Vol 39(4), 423-427.—In connection with a least-squares solution for fitting one matrix,  $A$ , to another,  $B$ , under optimal choice of a rigid motion and a dilation, P. H. Schönemann and R. M. Carroll (see PA, Vol 47:5986) suggested 2 measures of fit: a raw measure,  $e$ , and a refined similarity measure,  $e_s$ , which is symmetric. Both measures share the weakness of depending upon the norm of the target matrix,  $B$ . Therefore, both measures are useless for answering questions of the type: "Does  $A$  fit  $B$  better than  $A$  fits  $C$ ?" 2 new measures of fit are suggested which do not depend upon the norms of  $A$  and  $B$ , which are (0, 1)-bounded, and which, therefore, provide meaningful answers for comparative analyses.—*Journal abstract.*

10743. Lissitz, Robert W. & Green, Samuel B. (U Georgia) **Effect of the number of scale points on reliability: A Monte Carlo approach.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 10-13.—Discusses the contradictions and confusion in the literature on determining the optimal number of scale points in a rating scale, and suggests a mathematical model that allows for the simulation of the rating situation. The model involves generating data with different item variance-covariance structures and with different numbers of scale points. Such data were generated and used to calculate 3 reliability measures. The effects of different numbers of scale points and different covariance structures upon these reliability measures are examined, and the results help explain a large number of empirical studies exploring the "optimal number of scale points" problem.—*Journal abstract.*

10744. Loesel, Friedrich & Wuestendorfer, Werner. **[Problems of incomplete data matrices in empirical social research.]** (Germ) *Kölner Zeitschrift für Soziologie und Sozialpsychologie*, 1974(Jun), Vol 26(2), 342-357.—Discusses reasons for missing data. The structures of matrices with incomplete data are analyzed and statistical procedures for handling such matrices are given. (26 ref)

10745. Narens, Louis. (U California, School of Social Sciences, Irvine) **Minimal conditions for additive conjoint measurement and qualitative probability.** *Journal of Mathematical Psychology*, 1974(Nov), Vol 11(4), 404-430.—Presents axioms for additive conjoint measurement and qualitative probability. Representation theorems and uniqueness theorems are proved for structures that satisfy these axioms. Both Archimedean and non-Archimedean cases are considered. Approximations of infinite structures by sequences of finite structure are also given.—*Journal abstract.*

10746. Nitsch, Jürgen R. (Deutsche Sporthochschule, Köln, W Germany) **[The hierarchical structure of the self: An application of binary structural analysis (BISTRAN).]** (Germ) *Diagnostica*, 1974, Vol 20(4),

142-164.—Introduces a new method to cluster aspects of the self hierarchically. 465 Ss rated themselves on 91 rating scales. An initial factor analysis led to a first classification of the rating scales. One group loaded more highly on the 1st factor, the other more highly on the 2nd. Each of the 2 groups was separately factor analyzed, and the procedure was repeated, yielding 8 groups of ratings on the 3rd level, 4 on the 2nd, and 2 on the 1st. The 14 groups of ratings are interpreted and appear to constitute a rational scheme.—*M. Morf.*

10747. Orlik, Peter. (U Saarlandes, Saarbrücken, W Germany) **[The RAPID technique in factor analysis: A "computer-free" approximation procedure.]** (Germ) *Zeitschrift für Experimentelle und Angewandte Psychologie*, 1974, Vol 21(4), 592-620.—Describes a nonparametric fast approximation procedure to factor analysis which allows simultaneous determination of  $Q$ - and  $R$ -factors from binary or ternary data without correlation matrices. Case 1 of the RAPID technique is closely related to the CENTROID solution, especially suitable for binary data (e.g., G. A. Kelly's Rep.-Test). Case 2 leads to good approximations of the "true" principal axes solution. Data in this case are trichotomized. Mathematical proofs, computational rules, and examples are provided. (English & French summaries)—*W. J. Koppitz.*

10748. Pawlik, Kurt & Buse, Lothar. (U Hamburg, Psychologisches Inst I, W Germany) **[Sampling errors of factor loads: A preliminary note.]** (Germ) *Zeitschrift für Experimentelle und Angewandte Psychologie*, 1974, Vol 21(4), 691-693.—Demonstrates that high-load values of factors gained in a factor analysis carry up to 3 times as many sampling errors as zero-loads. Factor rotation to simple structure is therefore statistically advantageous.

10749. Renn, Heinz. (U Hamburg, W Germany) **[The methodology of progress analysis: The problem of nonorthogonality of initial values and of factors of variation.]** (Germ) *Psychologische Beiträge*, 1974, Vol 16(1), 61-67.—Discusses implications of J. Fahrenberg and M. Myrtek's measure of individual reaction to a preceding stimulation. The suggested method can be applied only in cases of orthogonality of initial values and in cases of factors of variation. In all other cases there is a specification error, i.e., the data are analyzed according to a false model. A model using initial and final values explicitly as single variables is suggested. (French summary)—*English summary.*

10750. Rimmer, A. **A Radex of the language of emotion.** *Israel Annals of Psychiatry & Related Disciplines*, 1974(Sep), Vol 12(3), 238-241.—Reanalyzed J. R. Davitz's (1969) structural analysis of emotions, using the concept of facets and nonmetric data analysis. Reanalysis confirms the original finding and shows properties predicted by Davitz but not validated by factor analysis. Further structural properties emerged—a Radex formation for the set of variables.

10751. Rohner, Ronald P. & Ness, Robert C. (U Connecticut) **Procedures for assessing the validity and reliability of data in cross-cultural research.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 190.

10752. Shepard, Roger N. (Stanford U) **Representation of structure in similarity data: Problems and prospects.** *Psychometrika*, 1974(Dec), Vol 39(4),

373-421.—Discusses 6 major problems that confront attempts to use nonmetric multidimensional scaling to represent structures underlying matrices of similarity data. The problems and possible solutions are (a) attaining the globally minimum departure from monotonicity by judicious selection of the initial configuration to ensure convergence to the desired global minimum; (b) achieving a meaningful substantive interpretation by trying for a solution in space of 3 or fewer dimensions, by seeking objective means for finding the most interpretable rotated axes, and by searching for interpretable features other than axes; (c) determining the proper number of dimensions by recognizing the special advantages of visually accessible 2-dimensional representations and embedded clusterings and by striving toward more careful Monte Carlo studies; (d) avoiding loss or imposition of structure by selecting objects for nonmetric scaling that are not fewer than 10 in number or obviously grouped into a few psychologically compact clusters; (e) determining the form of the underlying metric (it is demonstrated that purely Euclidean solutions can be robust in the face of marked departures from the assumed Euclidean metric); and (f) representing discrete or categorical structure by using a nonhierarchical method of additive cluster analysis. (4 p ref)—*B. McLean*.

10753. **Smith, Robert B.** (U California, Santa Barbara) **Continuities in ordinal path analysis.** *Social Forces*, 1974(Dec), Vol 53(2), 200-229.—Clarifies and responds to T. P. Wilson's (1974) critique of the interpretations and use of ordinal statistics applied to the regression and path analysis of ordinal variables. First, the logic of R. B. Smith's (1972) technique for the path analysis of ordinals is explicated, and various interpretations for the path coefficient based on M. G. Kendall's tau-b are presented. Second, as an aid to interpretation, the family of tau-b class ordinal statistics are reconceptualized as special cases of generalized product-moment statistics rather than as analogs of interval statistics. Third, the virtues of this approach motivate the development of (a) a generalized regression coefficient in terms of the concepts of generalized pairwise difference, generalized variation, and generalized covariation; (b) a generalized path coefficient in terms of concepts such as the generalized correlation coefficient, the generalized regression coefficient, and the generalized variation; and (c) a generalized residual path coefficient in terms of the generalized correlation coefficient. (45 ref)—*Journal abstract*.

10754. **Somers, Robert H.** (Inst for Research in Social Behavior, Berkeley, CA) **Analysis of partial rank correlation measures based on the product-moment model: 1.** *Social Forces*, 1974(Dec), Vol 53(2), 229-246.—Defines partial rank correlation coefficients as special cases of a generalized product-moment system. The case of 2 independent variables is examined in detail, and the coefficient is partitioned into components summarizing information lying between and within conditional distributions. Probability interpretations are given for 2 basic components. Recent developments identifying the structural assumptions needed for a full probability interpretation and bases for a general theory are briefly summarized. The basic components that do not require

structural assumptions but cannot be calculated from bivariate data are suggested as alternative measures of partial rank correlation. The logic of statistically "partialling out" ordinal covariation is discussed and quantified. (27 ref)—*Journal abstract*.

10755. **Spence, Ian & Domoney, Dennis W.** (U Western Ontario, London, Canada) **Single subject incomplete designs for nonmetric multidimensional scaling.** *Psychometrika*, 1974(Dec), Vol 39(4), 469-490.—Employed Monte Carlo procedures to investigate the properties of a nonmetric multidimensional scaling algorithm when used to scale an incomplete matrix of dissimilarities. Various recommendations are made for users who wish to scale incomplete matrices: (a) Recovery is satisfactory provided that the "degrees of freedom" ratio exceed 3.5, irrespective of error level. (b) Cyclic designs provide best recovery, although random patterns of deletion perform almost as well. (c) Strongly locally connected designs, specifically overlapping cliques, are generally inferior. These conclusions are based on 837 scaling solutions and are applicable to stimulus sets containing more than 30 objects. (28 ref)—*Journal abstract*.

10756. **Wandell, Brian A.; Greeno, James G. & Egan, Dennis E.** (U California, School of Social Sciences, Irvine) **Equivalence classes of functions of finite Markov chains.** *Journal of Mathematical Psychology*, 1974(Nov), Vol 11(4), 391-403.—A matrical representation of a Markov chain consists of the initial vector and transition matrix of the chain, along with matrices that specify which observable response occurs for each state. The likelihood function based on a Markov model is stated in a general way using components of the model's matrical representation. It follows directly from that statement that 2 models are equivalent in likelihood if they are related through matrix operations that constitute a change of basis of the matrical representation. 2 necessary properties of a change matrix associating 2 Markov models that are members of the same equivalence class with respect to likelihood are derived. Examples are provided, involving use of the results in analyzing identifiability of Markov models, including a useful application of diagonalization that provides a connection between the problem of identifiability and the eigenvalue problem. (17 ref)—*Journal abstract*.

10757. **Wang, Ming-Mei; Schönemann, Peter H. & Rusk, Jerrold G.** (U Iowa) **A conjugate gradient algorithm for the multidimensional analysis of preference data.** *Multivariate Behavioral Research*, 1975(Jan), Vol 10(1), 45-79.—Continues P. H. Schönemann and M. M. Wang's (see PA, Vol 49:1541) work on a new individual difference model for the multidimensional analysis of preference data, developing a relatively efficient algorithm for applying the model to fallible data. It is based on the Method of Conjugate Gradients and thus does not require storage for 2nd-order derivatives. Several difference versions of such an algorithm are compared for robustness, accuracy, and speed of convergence. Results strongly suggest that the intervening conjugate gradient method (which iterates for only 2 of the 3 sets of unknowns and solves for the 3rd set algebraically at each stage) is the most effective method for most purposes. The algorithm is applied to a

relatively large set of political choice data which had been previously analyzed by a different method. The outcome of this empirical study not only confirms the earlier results but also leads, as a consequence of the stronger metric structure of the present model, to a more detailed and informative description of the data. (20 ref)—*Journal abstract.*

10758. Wilson, Thomas P. (U California, Santa Barbara) **On interpreting ordinal analogies to multiple regression and path analysis.** *Social Forces*, 1974(Dec), Vol 53(2), 196-199.—Criticizes proposals for multivariate analysis with ordinal variables based on analogies with product-moment formulae on the grounds that such analogies do not provide a basis for interpreting the resulting statistics in terms of evidence bearing on an hypothesis concerning the presence or absence of some specified relation in the data. It is concluded that the long-standing problem of multivariate analysis with ordinal data still awaits a satisfactory solution. It is suggested that the fundamental difficulty obstructing work on the problem is the lack of clear, precise formulation of what constitutes a multivariate ordinal relation.—*Journal abstract.*

## PERCEPTION AND MOTOR PERFORMANCE

10759. Allan, Lorraine G. (McMaster U, Hamilton, Ontario, Canada) **Second guesses and the attention-switching model for successiveness discrimination.** *Perception & Psychophysics*, 1975(Jan), Vol 17(1), 65-68.—Reviews J. Baron's (see PA, Vol 47:8047) data which he has interpreted as providing strong evidence against the account of successive discrimination provided by a class of models known as discrete psychological moment theory. Baron's conclusions are discussed with respect to A. B. Kristofferson's (1967a, 1967b, 1970) attention-switching model and to classical moment theory. It is concluded that Baron's second-guess data are not inconsistent with Kristofferson's model, and it is argued that the attention-switching model should not be classified as a discrete moment model.—*B. McLean.*

10760. Mikaelian, H. H. (U Georgia) **Restricted adaptation to prism rearrangement.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 547-550.—Measured changes in eye-foot and eye-hand coordination in 32 normally seeing college students following 20 min of squint prism viewing (alternate monocular viewing of the movements of each leg with the contralateral eye at 1-min intervals: prism base right for right eye and left for left eye). In different sessions, response changes were measured following the viewing of the left leg with the right eye (prism base right) for periods of 1 min interspersed with 1-min blank periods (periodic viewing). Sensorimotor changes following the alternate exposure condition were smaller and restricted to eye-foot responses.—*Journal abstract.*

10761. Muhich, Dolores. (Southern Illinois U, Carbondale) **Measuring empirical properties of psychomotor skills in different psychological environments.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1315-1330.—The role of decision-making and keystroking in the psychomotor activity of office typing tasks was

assessed for 41 2nd- and 4th-semester high school students and 19 advanced college students under 3 different work conditions: prearranged, unarranged without erasing errors, and unarranged with erasing errors. All differences for main effects for speed and errors were significant ( $p < .01$ ). When office tasks were done under wholly realistic conditions, planning and decision-making were one-half, keystroking was three-eighths, and erasing one-eighth of the task. At low levels of skill, time consumed for keystroking was nearly as salient in contributing toward completion of product as time consumed for decision-making. As psychomotor skill increased, the perceptual skill of decision-making played an increasingly dominant role. The amount of time needed for decision-making took on increasing salience in producing office communications as the difficulty of the task and amount of training were increased. (22 ref)—*Journal abstract.*

10762. Newell, K. M. (U Illinois) **Decision processes of baseball batters.** *Human Factors*, 1974(Oct), Vol 16(5), 520-527.—Examines the human performance characteristics of pitching and batting within the context of baseball game situations to determine their influence on the batter's decision to swing or not at a pitched ball. Signal detection theory techniques are used on generated data to show how the probability of the batter swinging at a "strike" and leaving a "ball" could be optimized. Applications of this approach to game situations and areas for future research are discussed.—*Journal abstract.*

10763. Sälzer, Martin. (Inst für Arbeitswissenschaft der Technischen Hochschule, Darmstadt, W Germany) **[Tremor measurements as a means for predicting aptitude for sensory-motor activities.]** (Germ) *Psychologische Beiträge*, 1974, Vol 16(1), 48-60.—Investigated predictability of aptitude for work involving high hand-eye coordination. Work performance of 22 male Ss at a simulated workshop was correlated with their tremor activity (TA) scores. The range of predictability from the TA scores for the various work tasks was between 12 and 71%. (French & English summaries) (19 ref)—*J. O. Jeske.*

10764. Verrillo, Ronald T. & Capraro, Anthony J. (Syracuse U, Inst for Sensory Research) **Effect of stimulus frequency on subjective vibrotactile magnitude functions.** *Perception & Psychophysics*, 1975(Jan), Vol 17(1), 91-96.—Determined subjective magnitude functions by the method of magnitude estimation at 60 and 250 Hz at the fingertip and thenar eminence of 6 Ss, both with and without a rigid surface surrounding the contactor. When the surround was in place, the slopes of the curves were independent of stimulus frequency. The slopes became frequency dependent when the surround was removed—the lower frequency produced a steeper slope at both body sites. An explanation of the effect, involving the frequency characteristics and spatial sensitivity of the receptors, is suggested. (18 ref)—*Journal abstract.*

10765. White, Rhea. (East Meadow Public Library, NY) **Sports & ESP.** *Psychic*, 1974(Nov-Dec), Vol 6(1), 44-49.—Discusses the possibility that ESP factors—telepathy, precognition, and psychokinesis—may sometimes operate to produce superior performance in sports and competitive games. Examples are cited from golf,

football, baseball, chess, Zen archery, and the martial arts. Theories are presented regarding the mode of operation of psi in such cases.

### Perceptual Processes

10766. Ball, Frederick; Wood, Christine & Smith, Edward E. (Stanford U) **When are semantic targets detected faster than visual or acoustic ones?** *Perception & Psychophysics*, 1975(Jan), Vol 17(1), 1-8.—Employed a total of 81 undergraduates in 3 experiments to explore G. Cohen's (see PA, Vol 45:5550) finding that semantic targets can be detected faster than visual or acoustic ones when searching through meaningful prose. In all experiments, S searched a sentence for a target defined visually, acoustically, or semantically. In Exp I the S detected semantic targets faster than visual- or acoustic-syllable targets, regardless of whether he was instructed to read the sentence for meaning or simply scan it. Exps II and III showed that this advantage of semantic targets over visual or acoustic ones was greatly reduced when all 3 types of targets were words. Results are interpreted as indicating that when words are presented in context, either (a) the unit of word perception is the entire word or (b) the unit of identification or awareness is at least as large as the entire word. (17 ref)—*Journal abstract*.

10767. Bartoshuk, Linda M. (John B. Pierce Foundation, New Haven, CT) **After dinner talk: Taste illusions: Some demonstrations.** *Annals of the New York Academy of Sciences*, 1974(Sep), Vol 237, 279-285.—Reviews studies in which the 4 primary tastes of sweet, sour, bitter, and salt were modified by exposing Ss first to chemicals that alter taste and then to 1 of the 4 taste stimuli themselves. In this sense, the tongue was temporarily modified so that foods took on different and perhaps more palatable tastes. While conventional seasoning procedures often produce a similar result, this technique has the advantage of requiring only minute quantities of the altering substance. Implications for health are discussed. In particular, a decrease in reliance on any single food additive (some of which may be harmful) is predicted. If dependent on a variety of taste-altering agents instead of only a few, individuals would be less likely to ingest large quantities of any single and potentially dangerous substance and industry would not suffer economic hardship if only one of many taste substitutes were banned from usage. (21 ref)—*R. S. Albin*.

10768. Berglund, Ulf. (Royal Inst of Technology, Acoustical Lab, Stockholm, Sweden) **Dynamic properties of the olfactory system.** *Annals of the New York Academy of Sciences*, 1974(Sep), Vol 237, 17-27.—Investigated properties of the olfactory system as a measuring device of odor sensation and odor stimulation. The adaptability of the olfactory system that makes it a highly sensitive device is emphasized. Experiments on time-course functions of adaptation and recovery, and effects of time and intensity of adaptation stimuli on perceived odor intensity, are described. In addition, a possible model of odor perception is discussed. (19 ref)

10769. Binnie, Carl A.; Montgomery, Allen A. & Jackson, Pamela L. (Purdue U) **Auditory and visual contributions to the perception of consonants.** *Journal of Speech & Hearing Research*, 1974(Dec), Vol 17(4),

619-630.—Studied perceptual confusions of 16 consonant-vowel (CV) syllables with 10 20-42 yr old normal-hearing lipreading teacher-students. Conditions of auditory-visual presentation at various signal-to-noise (S-N) ratios were used, as well as auditory-only and visual-only conditions in quiet. An articulatory feature classification system was used to analyze responses with regard to percentage correct intelligibility and relative information transmission. In the auditory conditions, features of voicing and nasality were least affected by noise, while place of articulation showed the greatest reduction in intelligibility. The auditory-visual confusions indicated that the visual channel in bisensory presentations reduced errors when phonemes differed by place of articulation, with the greatest visual complement occurring at the poorer S-N ratios. Responses from the visual-only condition indicated that the Ss were able to categorize the phonemes into discrete homophenous groups. Part-whole reliability for the visual-only condition was high, indicating that a short form of the test could be used for screening aural-rehabilitation clients. Since the Ss' ability to recognize visually 5 places of articulation was nearly perfect, it is suggested that emphasis in aural rehabilitation be placed on auditory training or use of contextual cues, rather than on lipreading.—*Journal abstract*.

10770. Cain, William S. (Yale U, Medical School) **Contribution to the trigeminal nerve to perceived odor magnitude.** *Annals of the New York Academy of Sciences*, 1974(Sep), Vol 237, 28-34.—Studied 2 human Ss who had total unilateral destruction of the trigeminal nerve but normal olfactory sensitivity on both sides. A group of 12 normal Ss was used for comparison. The studies were designed to discover the contribution of the trigeminal nerve to perceived odor magnitude. It was found that perceived magnitude was consistently lower via the deficient nostril, even at concentrations too low to produce obvious irritation. The odorants used were propyl alcohol, butyl alcohol, and butyl acetate.—*R. S. Albin*.

10771. Cohen, Malcolm M. & Larson, Carl A. (US Naval Air Development Ctr, Warminster, PA) **Human spatial orientation in the pitch dimension.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 508-512.—Conducted 2 experiments with a total of 11 normal male 21-36 yr old volunteers. In Exp I each S attempted to place himself at 13 different goal orientations between prone and supine. Deviations of achieved body pitch angles from goal orientations were determined. In Exp II each S attempted to align a visual target with his morphological horizon while he was placed at each of the 13 goal orientations. Changes in settings of the target were examined. Results indicate that Ss underestimated body pitch when they were tilted less than 60° backward or forward from the vertical, overestimated body pitch when they were nearly prone, and accurately estimated body pitch when they were nearly supine. In contrast, Ss set the visual target maximally above the morphological horizon when they were tilted 30° forward from the vertical. Findings are discussed in terms of common and different physiological mechanisms that may underlie judgments of these types. (16 ref)—*Journal abstract*.

10772. Cooper, Lynn A. & Shepard, Roger N. (U California, San Diego) **Mental transformation in the identification of left and right hands.** *Journal of Experimental Psychology: Human Perception & Performance*, 1975(Feb), Vol 104(1), 48-56.—In an experiment with 8 right-handed university students and staff, Ss determined as rapidly as possible whether each line drawing portrayed a left or a right hand when the drawings were presented in any of 4 versions (palm or back of either hand) and in any of 6 orientations in the picture plane. Reaction time varied systematically with orientation and, in the absence of advance information, was over 400 msec longer for the fingers-down orientation. However, when Ss were instructed to imagine a specified (palm or back) view of a specified (left or right) hand in a specified orientation, reaction times to test hands that were consistent with these instructions were short (about 500 msec), independent of orientation, and unaccompanied by errors. It is proposed that Ss determine whether a visually presented hand is left or right by moving a mental "phantom" of one of their own hands into the portrayed position and by then comparing its imagined appearance against the appearance of the externally presented hand.—*Journal abstract*.

10773. Dean, Douglas & Mihalasky, John. (Newark Coll of Engineering, PSI Communications Project, NJ) **Testing for executive ESP.** *Psychic*, 1974(Nov-Dec), Vol 6(1), 21-25.—Computerized tests of top executives for ESP indicate that superior ESP scores are strongly correlated with superior profit-making ability. It is recommended that the usual tests and interviews with potential company presidents should be supplemented by testing for ESP.

10774. Desor, J. A. & Beauchamp, Gary K. (U Pennsylvania, Monell Chemical Senses Ctr) **The human capacity to transmit olfactory information.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 551-556.—Notes that previous estimates of the capacity of the olfactory channel have been uniformly low and posits that either olfaction is considerably more limited than vision and audition or its capacity has been underestimated. The present study hypothesized that underestimation may be due to use of stimuli having low levels of information or lack of laboratory training. Whole odors from objects were used. 26 naive adult Ss performed at levels consistent with earlier reports and evidenced effects of prior experience in identifying the odors. With training, a much greater capacity than found previously was observed. It appears that the odors of single compounds and objects differ in information, dimensionality, or patterning in much the same way that color patches and pictures or tones and words differ.—*Journal abstract*.

10775. Dobervich, Carolyn. **Kirlian photography revealed?** *Psychic*, 1974(Nov-Dec), Vol 6(1), 34-39.—Research at Stanford University supports the theory that the haloes produced in Kirlian photography are not the results of previously unrecognized psychic energies but of physical factors, particularly the spacing between film, object, and electrical source.

10776. Engen, Trygg. (Brown U) **The potential usefulness of sensations of odor and taste in keeping children away from harmful substances.** *Annals of the New York Academy of Sciences*, 1974(Sep), Vol 237,

224-228.—33 4-7 yr old children and 35 adults were asked to judge preference for 1 odorant in each of the 10 pairs studied. Results indicate a smaller variability of preferences for children than for adults. In addition, older children preferred odorants more similar to those preferred by adults than to those preferred by the younger children, indicating developmental changes in preference. A similar experiment was carried out with 50 4 and 6 yr old children to ascertain preference for taste: peppermint, horehound, cinnamon, and cherry. Results show much greater variability for taste preferences than for odor preferences. It is suggested that this modality may be inherently more important in controlling ingestion than smell. Implications are drawn for both the issue of ingestion of dangerous substances and for the significant effect of odor on flavor and taste.—R. S. Albin.

10777. Glidden, Stephen H. **A random-behavior maze test for humans.** *Journal of Parapsychology*, 1974(Sep), Vol 38(3), 324-331.—Replicated W. Levy's (see PA, Vol 50:4097) paper-and-pen maze experiment which introduced the concept of random behavior by human Ss in an ESP test situation. 8 college students or graduates were used in the current study, and on the basis of previous work it was expected that scoring would be higher on random behavior trials (RBTs) than on non-RBTs. Because the Ss became frustrated with the waiting periods which occurred between trials in the earlier experiment, a "no-check" method was used in which the E waited until the completion of a maze to evaluate the results. No significant results were obtained using the "check" method; marginally significant results were found with the "no-check" method. As expected, most of the significant scoring occurred on RBTs.—*Journal abstract*.

10778. Green, Barry G. & Craig, James C. (Indiana U) **The roles of vibration amplitude and static force in vibrotactile spatial summation.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 503-507.—Exp I measured vibrotactile spatial summation at suprathreshold amplitudes, using a matching task to investigate the effect of varying contactor size on sensory magnitude at 3 different vibration frequencies. Unlike the threshold data, increasing contactor size resulted in increases in sensory magnitude at 25 and 40 Hz as well as at 160 Hz. The amount of summation varied directly with amplitude for the 2 lower frequencies. Exp II investigated the effect of increasing static force, independent of contactor size. 3 paid female undergraduate Os participated in both experiments. Results indicate that the spatial summation effects noted in Exp I may be due to increases in static force and not contactor area. Implications for the concept of spatial summation and for the duplex mechanoreceptor hypothesis are discussed.—*Journal abstract*.

10779. Jacobs, Diana E. & Galanter, Eugene. (Columbia U, Psychophysics Lab) **Estimates of utility function parameters from signal detection experiments.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 115.

10780. Koelega, Harry S. & Köster, E. P. (U Utrecht, Psychological Lab, Netherlands) **Some experiments on sex differences in odor perception.** *Annals of the New*

York Academy of Sciences, 1974(Sep), Vol 237, 234-246. —Assessed the differences in odor perception between men and women using a forced-choice method of constant stimuli in which Ss were required to indicate which of 4 flasks containing odorants was different from that of the other 3. A total of 756 adults, adolescents, and children were tested in 7 experiments. Sensitivity was measured in terms of numbers of correct responses. Questions are raised concerning the differences in odor sensitivity found between male and female adults. (No such sex differences were found for the adolescents or children.) Controversial results pertaining to sex differences in olfactory research are discussed. (22 ref)—R. S. Albin.

10781. McCallum, Peter & Goldberg, Henry. (U Melbourne, Austin Hosp, Vic, Australia) **Magnitude scales for electrocutaneous stimulation.** *Perception & Psychophysics*, 1975(Jan), Vol 17(1), 75-78.—Reviews the application of S. S. Stevens's (see PA, Vol 46:8332) power law to the sensation resulting from electrocutaneous stimulation. Its use for data from individual Os as well as pooled data from several Os is discussed. Magnitude estimates were obtained from 33 normal, young adult Os of the sensation resulting from electrocutaneous stimulation over the median nerve. 7 mathematical functions were applied to the data and tested for goodness of fit. The power function with or without threshold correction factor did not emerge as better than alternative functions. Difficulties in using the power function in studies of individual differences are reviewed. It is concluded that there is no adequate reason at present to discard the linear function in favor of more complex functions in psychophysical scaling of sensation induced by electric shock. (22 ref)—*Journal abstract*.

10782. Moskowitz, Howard R. & Gerbers, Clifford L. (US Army Natick Lab, Pioneering Research Lab, MA) **Dimensional salience of odors.** *Annals of the New York Academy of Sciences*, 1974(Sep), Vol 237, 1-16.—Applied profiling and proximity analyses of odor quality to 15 odorants selected to be reagent-grade and to span a wide range of olfactory qualities. Initially 5 concentrations of each were presented and magnitude estimates were obtained from 19 Os for each of the 75 concentrations. Os then rated every one of the 15 odors on a profile of 17 attributes. It was concluded that odor quality can be represented by profiles of different attributes and that ratio scaling procedures (magnitude estimation) can yield profile entries possessing ratio properties.—R. S. Albin.

10783. O'Mahony, M. & Godman, L. (Bristol U, England) **The effect of interstimulus procedures on salt taste thresholds.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 459-465.—Sodium chloride detection and recognition thresholds were measured with (Exp I, 2 university student Ss) and without (Exp II, 20 additional Ss) a prior artificial raising of the level of adaptation by a molar salt mouthrinse. In both cases, it was found that an interstimulus procedure involving water mouthrinses yielded lower thresholds than a procedure with no rinses. Results were predicted from adaptation level changes. The literature confirms these results, and difficulties in threshold measurement are discussed. (70 ref)—*Journal abstract*.

10784. O'Mahony, M. & Wingate, P. (U Bristol, England) **The effect of interstimulus procedures on salt taste intensity functions.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 494-502.—Conducted 2 experiments with 5 experienced adults and 20 naive university students, respectively, to study the effects of adaptation to residuals from prior tastings. Taste intensity functions were constructed for the salt taste, using variations of the method of direct magnitude estimation. The prediction that mouthrinsing would reduce residuals, lower the level of adaptation, and thus yield lower exponents was confirmed. The effect of the residuals tended to be reduced, however, when the power functions were adjusted for such threshold changes. Power function deviations from linearity are discussed. The literature on intensity scaling for the salt taste is examined and supports these findings. It is concluded that the interstimulus procedure, by altering residual stimulus levels played a major role in determining salt taste intensity functions. (54 ref)—*Journal abstract*.

10785. Pelletier, Kenneth R. (Langley Porter Neuropsychiatric Inst, San Francisco, CA) **Influence of transcendental meditation upon autokinetic perception.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1031-1034.—20 male and 20 female unpaid, normal volunteers were administered an autokinetic test, the Embedded Figures Test, and the rod-and-frame test prior to meditation instruction. After 3 mo of instruction in transcendental meditation, Ss were retested and demonstrated increased ego distance and field independence on all of the above tests. These variations in an autonomic, enduring response clarify several issues in research on perceptual style and meditation.—*Journal abstract*.

10786. Russell, David G. & Marteniuk, Ronald G. (U Illinois, Children's Research Ctr) **An informational analysis of absolute judgments of torque.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 443-448.—5 paid male university students participated in 7 experiments involving absolute judgments of stimuli selected from a continuum of torque. Exp I required Ss to make judgments on the intensity of 16 stimuli separated by equal intervals. These results were used in the construction of individual scales of equal discriminability. These scales were then used to select the stimuli for the remaining 6 experiments, in which 6, 8, 10, 12, 14, or 16 stimuli, separated by subjectively equal intervals, were used. An informational analysis was performed to determine the capacity of the kinesthetic system to transmit information derived from the inducement of torque. Maximum values of 1.680, 2.050, and 2.524 bits of information transmitted were obtained when the response was considered the output, and the input variables were, respectively, the stimulus, the stimulus and the S, the stimulus, the S, and the previous stimulus. Results are discussed in relation to information theory and the use of torque information in closed-loop control of movement. (27 ref)—*Journal abstract*.

10787. Saxe, Robert. (U California, Graduate School of Management, Los Angeles) **A test of Murdock's D scale technique using an unusual stimulus set.** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 585-587.—B. B. Murdock's D scale technique predicts that when

D%, a measure of stimulus discriminability, is plotted against stimulus position, a U-shaped curve will always result, with end stimuli being more discriminable than middle stimuli. This prediction was tested on a stimulus set in which the middle stimuli were widely separated and the end stimuli were closely spaced. Data from 10 college students show that the middle stimuli were the most discriminable. When data were adjusted for response bias by M. E. Doherty's 1966 procedure, they still did not fit the prediction derived from Murdock's method.—*Journal abstract.*

10788. Taylor, M. M. & Lederman, S. J. (Defence & Civil Inst of Environmental Medicine, Downsview, Ontario, Canada) **Tactile roughness of grooved surfaces: A model and the effect of friction.** *Perception & Psychophysics*, 1975(Jan), Vol 17(1), 23-36.—Develops a model based on the static deformation of the skin touching grooved aluminum tiles as stimuli, and 11 parameters of the deformation are individually compared with the experimental data. All parameters were tested first in an approximate way, and then the better parameters were recalculated in a more exact manner. 3 parameters—the depth to which the finger penetrates the groove, the cross-sectional area of the finger within the groove, and the cross-sectional area of the deviation of the skin from its resting position—all predict the roughness well as a function of finger force and groove width. The last of the 3 predicts roughness best as a function of land width and is tentatively preferred as “the stimulus for roughness.” All predictions from the static model indicate that variation of the coefficient of friction between skin and tile should have little or no effect. This counterintuitive prediction is confirmed by the results of an experiment. (15 ref)—*Journal abstract.*

10789. Tebecis, A. K. & Provins, K. A. (Australian National U, Canberra, ACT) **Accuracy of time estimation during hypnosis.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1123-1126.—14 experimental Ss experienced in self-hypnosis and highly hypnotizable (according to scores on the Barber Suggestibility Scale) were told to estimate a period of 2 min and 11 sec during hypnosis on 2 different occasions and once again during the awake state in a subsequent (imagination) session. Another (random) sample of 14 Ss was told to estimate an identical period while awake in a single (imagination) session. These Ss had never been hypnotized and proved to be significantly lower in waking suggestibility than the experimentals. Both groups underestimated the 131-sec period by up to about 40%. The mean time estimates of the experimental group did not differ significantly between the 2 hypnosis sessions or between either hypnosis session and the imagination session. The random control group appeared to underestimate the time to a greater extent than the experimentals, but the differences between pairs of groups were not statistically significant. Results suggest that hypnosis does not improve the accuracy of estimating short periods of time.—*Journal abstract.*

10790. Telage, Kal M. & Fucci, Donald. (Ithaca Coll) **Concerning intrasubject measurements of successive lingual vibrotactile responses.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1047-1052.—Obtained ascending lingual vibrotactile thresholds for 110 18-36 yr old

normal adults under test-retest conditions. Each condition included 2 different threshold criteria for frequencies 200 and 400 Hz, respectively. Although differential threshold responses were observed between frequencies, means and standard deviations remained consistent for both conditions. Reliability coefficients indicated good intra-S consistency for successive threshold measurements.—*Journal abstract.*

10791. Thomas, Ewart A. & Brown, Irvin. (Stanford U) **Time perception and the filled-duration illusion.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 449-458.—Results of a reproduction design employed with 20 paid 18-22 yr old Ss show that temporal intervals containing brief tones appeared longer than empty intervals of the same duration, the effect being independent of duration. These and previous data are discussed within a theoretical framework which allows for the interrelation of data from different time perception tasks. A reversible encoding model is stated which accounts for much of the data obtained with empty intervals. A “chunking” model, in which tones occurring in an interval serve to segment the interval during encoding, can account for the filled-duration illusion if certain conditions are met. Mechanisms that are consistent with these conditions are stated. (18 ref)—*Journal abstract.*

10792. Vallejo Rulloba, J. & Porta Biosca, A. (Provincial & Clinical Hosp, Barcelona, Spain) [*Perception and Intelligence.*] (Span) *Anuario de Psicología*, 1973, No 8, 21-34.—Divided 100 Ss of military age into groups of high intelligence and low intelligence based on their scores in Raven's Test of Progressive Matrices. Monserat's tachistoscopic technique was then used as a measure of perception in the 2 groups. Findings indicate a correlation between high intelligence and perceptual skill.

10793. Verrillo, Ronald T. & Capraro, Anthony J. (Syracuse U, Inst for Sensory Research) **Effect of simultaneous auditory stimulation on vibrotactile thresholds.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 597-600.—Employed 6 experienced Os to determine vibrotactile thresholds at 250 and 400 Hz in the presence of (a) the sounds emitted by the vibrator, (b) continuous tonal or narrow-band masking noise, or (c) a pulsed tone synchronized with the vibrator signal. The measure of a cross-modality effect was the threshold shift occurring between each condition and the control condition, in which earmuff silencers eliminated the vibrator sounds. Continuous tones or noise had no effect upon vibrotactile thresholds. However, auditory signals synchronized with the vibrator signals did significantly elevate vibrotactile thresholds. (29 ref)—*Journal abstract.*

10794. Witelson, Sandra F. (McMaster U, Medical Ctr, Hamilton, Ontario, Canada) **Hemispheric specialization for linguistic and nonlinguistic tactual perception using a dichotomous stimulation technique.** *Cortex*, 1974(Mar), Vol 10(1), 3-17.—Administered 2 tests involving dichotomous tactile stimulation, one using nonsense shapes and the other letters, to 47 normal right-handed boys 8-16 yrs old. Nonlinguistic tactile information was more efficiently processed in the right (non-speech) hemisphere in neurologically intact individuals, as had been previously inferred from studies of individuals with unilateral brain damage. The right hemisphere

specialization for nonlinguistic tactual perception was found to be present as early as 6 yrs of age. Simple tactile linguistic stimuli such as letters were not processed more efficiently by the left hemisphere. Results are interpreted to indicate that linguistic stimuli presented tactually must be analyzed first in a spatial code and then translated into a linguistic code. This suggests that there is no direct link between input and linguistic analysis in the tactual modality as there appears to be in the visual and auditory modalities.—*R. Gunter.*

10795. Yusim, E. D. (Pedagogical Inst, Kokchetav, Kazakh SSR) [Individual differences in reproducing the speed characteristics of a moving object.] (Russ) *Voprosy Psikhologii*, 1974(Jul-Aug), No 4, 137-143. —Compared groups of Ss, identified by laboratory and life situation measurements as having a mobile or an inert nervous system, on their ability to reproduce, immediately and after a delay, the speed characteristics of a moving dot. (26 ref)—*L. Zusne.*

10796. Zimmermann, Marc L. (East Texas State U) **Subjective cross-modal stimulation.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1165-1166. —Individually tested 33 male and 33 female undergraduates to determine the correlation between the perceived strength of an auditory and a tactile stimulus as measured by the subjective brightness of an adjustable light. While Ss discriminated between the relative strengths of the stimuli in each condition, there was no agreement as to the brightness of the light for each treatment. Also, there was no difference between responses by males and females.

### Auditory Preception

10797. Aniansson, Gunnar. (U Göteborg, Sahlfren's Hosp, Sweden) **Methods for assessing high frequency hearing loss in every-day listening situations.** *Acta Oto-Laryngologica*, 1974, Suppl 320, 50 p. —Conducted a series of studies to determine the effect of the high-frequency hearing loss on speech intelligibility. Simulated, recorded everyday listening situations, using community noise and competing speakers, were tested with male adults, 22 with normal and 41 with impaired hearing. The validity of the test methods was checked with 6 normally hearing male students and showed that binaural listening via the recordings gave better or as good results as direct listening. Findings show that good speech discrimination in quiet required normal hearing ability up to 2,000 Hz. In everyday situations, however, it required normal bilateral hearing up to 3,000 Hz. Competing voices added to a difficult listening situation caused a significantly larger fall in speech discrimination in hearing-impaired Ss than in normals. The intelligibility of high- and of low-pass filtered speech in everyday noise situations was compared in 66 normally hearing male medical students. Results show that reduced information above 2,300 and 3,100 Hz gave the same speech discrimination as reduced information below 1,500 and 950 Hz, respectively. A method is presented for predicting speech discrimination in everyday noise situations from tone audiograms and by calculating the articulation index. It is suggested that this method, which agrees well with the experimental results, be used for

checking clinical tests for evaluating speech intelligibility in everyday situations. (77 ref)—*Journal summary.*

10798. Bartholomeus, Bonnie. (McGill U, Montreal, Quebec, Canada) **Dichotic singer and speaker recognition.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 407-408. —Conducted a study of 24 undergraduates to test the hypothesis that there is no difference between the recognition of sung and spoken voices. Ss were presented with 2 dichotic voice recognition tests which were similar in all respects except that stimuli were spoken on one and sung on the other. A finding of significantly more accurate speaker recognition indicates differences in the processing of singing and speaking voices. Results of the singer recognition test replicated a previous finding of no significant difference between ears. A similar lack of lateralization for speaker recognition could not be unambiguously interpreted because the absence of ear asymmetry was significantly related to very high levels of overall accuracy.—*Journal abstract.*

10799. Cohen, Gillian & Martin, Maryanne. (U Oxford, England) **Hemisphere differences in an auditory Stroop test.** *Perception & Psychophysics*, 1975(Jan), Vol 17(1), 79-83. —In Exp I 18 right-handed students were required to judge the pitch of the following stimuli: 2 pure tones, one at a high frequency and one at a low frequency; 2 congruent words, "high," sung at the high frequency, and "low," sung at the low frequency; and 2 noncongruent words, "high" at low frequency and "low" at high frequency. A sequence of these stimuli was presented monaurally first to one ear and then to the other. The Stroop effect (the difference between mean response time (RT) to congruent words, and mean RT to noncongruent words) was larger for right ear (left hemisphere) presentation. Exp II used 8 other Ss in a dichotic repetition of Exp I, with a competing message presented to the opposite ear. Again, the Stroop effect was larger for the right ear, and the ear differences were slightly more marked. The result reflects hemispheric specialization for linguistic and nonlinguistic processing and a model of Stroop conflict in which response competition varies with the relative availability of the conflicting response.—*Journal abstract.*

10800. Cooper, William E. (Massachusetts Inst of Technology) **Selective adaptation for acoustic cues of voicing in initial stops.** *Journal of Phonetics*, 1974(Oct), Vol 2(4), 303-313. —Conducted a study of 10 undergraduates to test whether adaptation with [da]-long and [da]-short syllables would produce different effects on the perception of a typical test series varying in voice onset time (VOT). Results indicate that the original adaptation effects were partly attributable to the presence or absence of the formant transitions after voicing onset, rather than to VOT per se. Results may be attributable to adaptation of a detector sensitive to a weighted combination of the 2 hypothetical cues of VOT and the duration of voiced transitions. (37 ref)—*Journal abstract.*

10801. Cutting, James E. & Rosner, Burton S. (Wesleyan U) **Categories and boundaries in speech and music.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 564-570. —Considers that perceptual categories and boundaries arise when Ss respond to continuous variation on a physical dimension in a discontinuous fashion. It is more difficult to discriminate between members of

the same category than to discriminate between members of different categories, even though the amount of physical difference between both pairs is the same. Speech stimuli have been the sole class of auditory signals to yield such perception; for example, each different consonant phoneme serves as a category label. The present experiments were conducted with a total of 32 undergraduate Ss. Exp I demonstrated that categories and boundaries occurred for both speech and nonspeech stimuli differing in rise time. Exp II showed that rise time cued categorical differences in both complex and simple nonspeech waveforms. Taken together, these results suggest that certain aspects of speech perception are intimately related to processes and mechanisms exploited in other domains. The many categories in speech may be based on categories that occur elsewhere in auditory perception. (23 ref)—*Journal abstract*.

10802. Cutting, James E. (Wesleyan U) **Two left-hemisphere mechanisms in speech perception.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 601-612.—Conducted 4 experiments with a total of 74 right-handed, normally hearing university students. Results show that right-ear advantages of different magnitudes occurred systematically in dichotic listening for different phoneme classes and for certain phonemes according to their syllabic position. It is proposed that such differences cannot be accounted for in terms of a single mechanism unique to the left hemisphere. Instead, at least 2 mechanisms are needed. One such device appears to be involved in the auditory analysis of transitions and other aspects of the speech signal. This device appears to be engaged for speech and nonspeech sounds alike. The other mechanism, the more accustomed "speech processor," appears to make all phonetic decisions in identifying the stimulus. (31 ref)—*Journal abstract*.

10803. Davis, James M.; Weiler, Ernest M. & Gildenblatt, Stuart. (U Connecticut, Psycho-Acoustics Lab) **A pilot study of reaction time and loudness adaptation.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 114-115.

10804. Deutsch, Diana. (U California, Ctr for Human Information Processing, San Diego) **An auditory illusion.** *Nature*, 1974(Sep), Vol 251(5473), 307-309.—Tested 86 Ss participating in a study of auditory illusion. The stimulus configuration received by each S consisted of a sequence of tones alternating in pitch between 400 Hz and 800 Hz. Each tone lasted 250 msec, with no gap between tones, and each sequence was presented at equal amplitude, but the ear of input for each component was switched every 250 msec. None of the Ss obtained the correct percept, reporting a single tone oscillating from ear to ear. Localization patterns associated with handedness also were reported with the higher tone in each pattern localized in the right ear of right-handed Ss.—*A. de la Haba*.

10805. Diehl, Randy L. (U Minnesota) **The effect of selective adaptation on the identification of speech sounds.** *Perception & Psychophysics*, 1975(Jan), Vol 17(1), 48-52.—Performed an experiment with 6 paid university student Ss to determine the effect of selective adaptation on the identification of synthetic speech sounds which varied along the phonetic dimension, place of articulation. Adaptation with a stimulus of a particular place

value led to a reduction in the number of test stimuli identified as having that place value. An identification shift was obtained even when the acoustic information specifying place value for the adapting stimulus had virtually nothing in common with the information specifying place value for any of the test stimuli. Removing the vowel portion of an adapting stimulus eliminated identification shift only when the resulting stimulus was no longer perceived as speech-like. Results indicate that at least part of the adaptation effect occurred at a site of phonetic, not merely acoustic, feature analysis.—*Journal abstract*.

10806. Duffy, Joseph R. & Golas, Thomas G. (U Connecticut) **Sentence intelligibility as a function of key word selection.** *Journal of Speech & Hearing Research*, 1974(Dec), Vol 17(4), 631-637.—Investigated the relationship between word predictability and sentence intelligibility. This relationship was examined in 60 normal-hearing submarine school candidates by comparing intelligibility scores obtained with frequency-filtered sentences which were scored using key words empirically determined to be representative of 3 different degrees of predictability. It was hypothesized that the scores obtained would be a function of the predictability status of the key words used in scoring. Results indicate significant differences between the 3 scoring procedures for each sentence list under 2 filtering conditions (420- and 360-Hz low pass), and these differences were in the hypothesized direction. Results suggest that use of easy-to-predict words for scoring purposes will increase sentence intelligibility scores, while use of difficult-to-predict words will depress scores. It is concluded that word predictability is a factor influencing sentence intelligibility and that careful selection of key words, based on their predictability status, is a method of controlling or influencing the intelligibility of sentences.—*Journal abstract*.

10807. Duso, A. E. (City of London Polytechnic, England) **Thomas and Legge's matching hypothesis for detection and recognition tasks: Two tests.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 466-470.—E. A. Thomas and D. Legge (see PA, Vol 44:4561) have proposed a matching hypothesis for 2-alternative detection and recognition tasks. Given symmetric payoff, S is supposed to match his unconditional response probabilities to the presentation probabilities. More generally, even when payoff is asymmetric, S is supposed to keep his unconditional response probabilities constant across different discriminability levels. Time series analysis was applied in the present study to the response sequences from 2 auditory amplitude recognition tasks to test both hypotheses. Exp I obtained a single sequence from each of 16 university staff and student Ss. Exp II obtained 2 sequences at different discriminability levels from each of 24 additional Ss. Departures from the matching hypothesis were extremely gross in both cases. In addition, Exp II showed clear changes in the response probabilities across discriminability conditions, though these were not systematic in direction across Ss. (16 ref)—*Journal abstract*.

10808. Fitzgibbons, Peter J.; Pollatsek, Alexander & Thomas, Ian B. (U Massachusetts, Amherst) **Detection of temporal gaps within and between perceptual tonal**

groups. *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 522-528.—Hypothesized that tones widely separated in frequency are processed in separate communication channels. In 2 experiments, a total of 15 undergraduate listeners attempted to detect brief temporal gaps between items in a simple tonal sequence of 2 high tones followed by 2 low tones. Temporal resolution within both the high and low groups was near perfect; between-group detection scores were significantly lower. Results are interpreted as evidence for a processing time delay when shifts of focal attention occur between perceptual structures organized within the frequency domain. (21 ref)—*Journal abstract*.

10809. Henley, S. H. & Dixon, N. F. (University Coll London, England) **Laterality differences in the effect of incidental stimuli upon evoked imagery.** *British Journal of Psychology*, 1974(Nov), Vol 65(4), 529-536.—Studied 38 undergraduates to examine the hypothesis that noninterference between attended and unattended information in dichotic listening would fail to occur if the primary task could be facilitated by information on the unattended channel. D. Mackay (see PA, Vol 50:10457) has provided some evidence to support this hypothesis using verbal material on both channels, thus involving, presumably, only 1 hemisphere. By using stimulus materials on the 2 channels that are believed to be processed by the right and left hemispheres respectively, a 2nd hypothesis, that facilitation by the unattended input would depend upon laterality differences, was also tested. Considerable support was found for both hypotheses. (24 ref)—*Journal abstract*.

10810. Heyduk, Ronald G. (Amherst Coll) **Rated preference for musical compositions as it relates to complexity and exposure frequency.** *Perception & Psychophysics*, 1975(Jan), Vol 17(1), 84-90.—120 undergraduates Ss heard 4 piano compositions that were constructed to represent differing degrees of complexity, as defined by their chordal and rhythmic properties and corroborated by Ss' complexity ratings. In line with the predictions of an optimal complexity model of musical preference, judged liking for the compositions was a unimodal function of their complexity. After each composition was rated for liking, 1 of the 4 compositions was presented and rated an additional 16 times. Also congruent with an optimal complexity model was the finding that the affective consequences of repeated exposure varied depending upon whether the repeatedly exposed composition was more or less complex than the S's preferred complexity level. The latter finding suggests that repeated exposure effects are a function of both situational and individual factors. (27 ref)—*Journal abstract*.

10811. Irvine, D. H. (Polytechnic of Central London School of Management Studies, England) **A new type of speech intelligibility test.** *Ergonomics*, 1974(Nov), Vol 17(6), 783-788.—Describes the construction of the Answer in Sentence (AIS) test which appears to have certain advantages over existing speech intelligibility tests. A preliminary trial was conducted with 90 normally hearing Ss and a validation experiment with 30 additional Ss. Performance on the AIS correlated highly with J. W. Black's multiple-choice test (1953) and with D. B. Fry's single-word test (1961) and had a high

reliability when measured by a split-half correlation method. Because of the relatively small number of Ss used in developing the AIS, it is suggested that the test be used with caution as a measure of individual differences. (French & German summaries)—*Journal abstract*.

10812. Molino, John A.; Zerdy, Gerald A. & Frome, Francine S. (National Bureau of Standards, Inst for Basic Standards, Washington, DC) **Toward a more musical foghorn.** *Human Factors*, 1974(Dec), Vol 16(6), 567-575.—10 college students gave preference judgments for 4 pure tones (120, 300, 500, and 835 Hz) and 11 tone composites constructed from combinations of the pure tones. Equal aversion (tolerance) levels were measured for the 4 pure tones and for 5 of the composites. Sensation-level measures were employed to express aversion thresholds in order to take account of the differential sensitivity of the human ear at different frequencies. Certain operational conclusions are suggested for the design of acoustic navigation aids. The higher frequency pure tones and composites were generally more preferred and were also tolerated at higher sensation levels. The 120-Hz pure tone was a highly nonpreferred signal. The presence of a 120-Hz component in any composite lowered both the preference value and the maintained sensation level. In the case of the moderately preferred 500-Hz pure tone, adding other more-preferred, pure-tone components increased the preference for the signal. (21 ref)—*Journal abstract*.

10813. Nickerson, R. S. & Freeman, B. (Bolt Beranek & Newman, Cambridge, MA) **Discrimination of the order of the components of repeating tone sequences: Effects of frequency separation and extensive practice.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 471-477.—Required 6 paid high school student Ss to identify repeating sequences of pure tones that differed only with respect to the order in which the tones occurred. With tones occurring at a constant rate of 5/sec, performance was better when the tones were widely spaced in frequency than when they were less widely spaced. One S was able, after considerable practice, to distinguish among different sequences whose component tones were presented at rates up to 500/sec. It is tentatively concluded that, in this case, performance was based on temporal (order) information at the slowest presentation rates, primarily on spectral information at the highest rates, and on both order and spectral information at intermediate rates.—*Journal abstract*.

10814. Roeser, Ross J. & Glorig, Aram. (Callier Ctr for Communication Disorders, Dallas, TX) **Pure tone audiometry in noise with Auraldomes.** *Audiology*, 1975(Mar-Apr), Vol 14(2), 144-151.—Obtained pure tone thresholds using a TDH-39 driver mounted in a standard cushion and an Auraldome circumaural enclosure. Thresholds were recorded from 6 trained, normal-hearing young adults in quiet and in the presence of broad band sound field noise at 50, 60, and 70 db sound-pressure level (SPL). No significant differences were observed between the 2 earphone conditions in the presence of any of the ambient broad-band noise levels. However, thresholds were statistically different in the quiet condition. Results raise questions regarding the calibration of intensity for Auraldomes and indicate that this particular circumaural cushion provides no advan-

tage over standard cushions in the presence of ambient noise above 50 db SPL. (French summary)—*Journal abstract*.

10815. Stream, Richard W. & Dirks, Donald D. (U Texas, Medical Branch, Galveston) **Effect of loudspeaker position on differences between earphone and free-field thresholds (MAP and MAF).** *Journal of Speech & Hearing Research*, 1974(Dec), Vol 17(4), 549-568.—Obtained free-field and earphone measurements from 8 practiced adult listeners under monaural and binaural conditions to assess the hypothesis that a major source of the disparity between minimum audible pressure (MAP) and minimum audible field (MAF) speech thresholds is the position of the loudspeaker relative to the listener's head. Free-field measurements were made at 7 different loudspeaker positions. Stimuli were spondaic words and pure tones at 5 octave intervals from 250 to 4000 Hz. The smallest monaural MAP-MAF difference for spondaes occurred at 0° azimuth (2.7 db) and the largest appeared at the 60° near-ear position (7.1 db). Similar results emerged for spondaic words under binaural conditions, although the magnitude of the changes due to variations in loudspeaker position was reduced considerably from comparable monaural conditions. Results indicate that the disparities in MAP-MAF differences of previous investigations were due principally to the location of the loudspeaker. The differences between MAP and MAF thresholds were compared to other published results on ear-canal pressure measured in free field and under earphone. Data suggest that the MAP-MAF differences observed in this study may be related partially to the differences in calibration techniques used to specify the level of the signal in free field and under earphone. (17 ref)—*Journal abstract*.

10816. Summerfield, A. Q. & Haggard, M. P. (Queen's U Belfast, Northern Ireland) **Perceptual processing of multiple cues and contexts: Effects of followed vowel upon stop consonant voicing.** *Journal of Phonetics*, 1974(Oct), Vol 2(4), 279-295.—Conducted a study of 16 undergraduate and postgraduate students to examine 2 acoustical correlates of voicing, previously combined in the voice onset time concept, that may be considered cues. The 1st correlate of voicing was the time from the burst to the 1st voicing pulse and was measured as the separation of these 2 events; the 2nd was the relative position in the formant transition frame at which voicing onsets and was measured as the amount of voiced first formant (F1) transition. Results show that for velar stops before /a/ both cues played a role in voicing perception although the transition cue was dominant. For velar stops before /i/, where no F1 transition occurs, the separation cue appeared more important than it did in /a/ context. Results point to the need to distinguish between contextual adjustments involving a simple boundary shift and those involving a reweighting of cues according to context. The 2 cues used appeared to be of different types with attendant differences in the effects they generate in perception experiments. A sophisticated view of the processing of different cues may be necessary to give an account of adaptation in the voicing feature in experiments where the percentage of voiced or unvoiced responses is modified following repeated

exposure to a stimulus with a distinct value of the feature. (15 ref)—*Journal abstract*.

### Visual Perception

10817. Alderson, G. J. & Whiting, H. T. (U Leeds, England) **Prediction of linear motion.** *Human Factors*, 1974(Oct), Vol 16(5), 495-502.—Used a motion-prediction paradigm in 2 experiments with a total of 54 17-32 yr old male university students and technicians. Each S viewed a moving tennis ball cross the display and disappear from view and was required to estimate when the ball would reach a target set on the extended motion track. The effects of viewing distance, prediction distance, and stimulus velocity upon the accuracy and variability of performance were examined. Exp I found that both prediction distance and stimulus velocity were significant variables, their additive effects showing a linear relationship between prediction time and both constant and variable errors. Exp II demonstrated that these linear relationships were replicable phenomena and that motion prediction became more accurate when Ss were given knowledge of results and allowed to practice the task. (16 ref)—*Journal abstract*.

10818. Attneave, Fred & Block, Gene. (U Oregon) **The time required to compare extents in various orientations.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 431-436.—In Exp I 3 paid undergraduate Ss compared the lengths of lines that varied in absolute and relative orientation. Ss' reaction times (RTs) showed a constant error pattern of which the familiar horizontal-vertical illusion was a special case, but horizontals were underestimated (relative to other slopes) much more than verticals were overestimated. The effect of difference in orientation was not great, though RT did increase significantly as the difference neared 90°. Exp II, with 3 additional Ss, was similar except that the lengths of lines were compared with the widths of bars in a grating. In this case, no consistent pattern of constant error emerged, and there was no suggestion that difference in orientation affected RT.—*Journal abstract*.

10819. Banks, Martin S. & Stolarz, Stephanie J. (U Minnesota, Ctr for Research in Human Learning, Inst of Child Development) **The effect of head tilt on meridional differences in acuity: Implications for orientation constancy.** *Perception & Psychophysics*, 1975(Jan), Vol 17(1), 17-22.—G. Horn and R. M. Hill (1969) and others have reported that a small number of units in the cat visual cortex undergo changes in receptive field orientation associated with body tilt. Such units reportedly compensate for tilt and may represent a mechanism for human orientation constancy. To test this, meridional differences in visual acuity for head-vertical and head-tilted viewing conditions were measured with the authors serving as Os. Results of Exp I do not directly support or refute the involvement of tilt-compensatory units. Results of Exp II show that meridional acuity differences correspond to the retinal and not the spatial orientation of the stimulus. It is concluded that tilt-compensatory cortical units are not involved in human orientation constancy. The physiological evidence indicating the existence of tilt-compensatory units in the visual cortex is reexamined. (34 ref)—*Journal abstract*.

10820. Banks, William P.; Bodinger, Deborah & Illige, Martha. (Pomona Coll) **Visual detection accuracy and target-noise proximity.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 411-414.—Examined the proximity effect in a forced-choice visual detection. 5 college students were tachistoscopically presented stimulus arrays that always had as a target either the letter F or T; Ss had to determine on each trial whether an F or a T was presented. Results show that detection accuracy improved as the distance was increased between the target and the noise items in the array that were confusable with it. It is suggested that the proximity effect is a natural prediction of W. Estes's (1964) theory that detection is mediated by feature-detecting receptive fields. Results are explained in terms of perceptual configurations in the array—when the target was grouped with confusable noise its visibility was less than when it was not.—*Journal abstract.*

10821. Blake, Randolph & Fox, Robert. (Vanderbilt U) **Adaptation to invisible gratings and the site of binocular rivalry suppression.** *Nature*, 1974(May), Vol 249(5456), 488-490.—Attempted to clarify the interaction between pattern adaptation and rivalry suppression. By incorporating 2 separate phenomena, binocular rivalry and visual aftereffects, into 1 paradigm, a technique is presented that permits inferential analysis of the intermediate states in the visual process.

10822. Caelli, Terrence M. & Finlay, David C. (U Melbourne, Parkville, Vic, Australia) **Pattern discrimination of Gaussian distributions of orientation and line length parameters.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 489-493.—Notes that the 2 pattern parameters, line length (L) and orientation ( $\Theta$ ), have been salient in microelectrode studies and adaptation experiments with the vertebrate visual system, but have not been systematically examined in a pattern discrimination paradigm. It was argued that, because of their physiological importance, the detection of pattern differences should be predictable with known distributions of L and  $\Theta$ , using 40 naive undergraduate Ss. It was also argued that the discriminability of the concatenation of L and  $\Theta$  (L $\Theta$ ) could be predicted from the individual L and  $\Theta$  performance results. Results indicate support for both hypotheses and also imply that the L discriminations were more difficult than  $\Theta$ , using signal detection theory. (17 ref)—*Journal abstract.*

10823. Cohn, Theodore E. & Lasley, David J. (U California, School of Optometry, Berkeley) **Detectability of a luminance increment: Effect of spatial uncertainty.** *Journal of the Optical Society of America*, 1974(Dec), Vol 64(12), 1715-1719.—The theory of signal detectability (TSD) predicts that uncertainty of the spatial location of a luminance-increment stimulus should influence the detectability of the stimulus. If  $d'$  is the detectability,  $E$  the increment luminance,  $N^2$  the variance of the noise that obscures the signal, and  $M$  the number of equally likely nonoverlapping stimuli, TSD predicts ( $d'$ )<sup>2</sup> = log<sub>e</sub> [1 - 1/M + 1/M exp( $E^2/N^2$ )]. TSD also predicts that the slope of the receiver operating characteristic curve on probability paper should decrease in the presence of stimulus-position uncertainty. Both predictions were confirmed in psychophysical tests of 3 human Os for foveally viewed stimuli.—*Journal abstract.*

10824. Coren, Stanley & Porac, Clare. (U British Columbia, Vancouver, Canada) **The fading of stabilized images: Eye movements and information processing.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 529-534.—Investigated whether controlling the nature of an O's interaction with a stabilized image would control the rate of fading of the image: if the O does not attempt to explore the image, he should rapidly be provided with information which indicates that the image is completely decorrelated with his eye movements. Results of 2 experiments with a total of 100 normally seeing paid volunteers indicate that neural and photochemical satiation processes are inadequate to explain the fading of the stabilized retinal image. When eye movements were attempted over the stimulus, fading occurred more rapidly, indicating an information processing component in the disappearance of the image. (41 ref)—*Journal abstract.*

10825. Davidoff, J. B. (University Coll Swansea, Wales) **Hemispheric differences in the perception of lightness.** *Neuropsychologia*, 1975(Jan), Vol 13(1), 121-124.—Conducted 2 experiments with 12 right-handed and 12 left-handed undergraduates in Exp I and with 48 Ss with normal color vision and either right or left eye and hand dominance in Exp II. Colored and grey stimuli were presented to the left and right visual fields. It was found that which stimulus was seen as lighter depended to some extent on the handedness of the S. In particular, right-handed Ss saw the stimulus on the left as lighter. This provides further evidence for the right hemisphere as being more important for perceptual functions. (French & German summaries) (18 ref)—*Journal abstract.*

10826. Dichgans, J.; Diener, H. C. & Brandt, Th. (U Freiburg, Neurological Clinic, W Germany) **Optokinetic-graviceptive interaction in different head positions.** *Acta Oto-Laryngologica*, 1974(Nov-Dec), Vol 78(5-6), 391-398.—Reports that displacements of the apparent vertical induced by exclusive visual stimulation with the head erect are moderate but increase progressively with larger head tilt angles. Data confirm the hypothesis that visual motion information and graviceptive information are centrally combined for the computation of the apparent orientation of gravity and have functional implications for postural orientation. (German summary) (36 ref)

10827. Engstrom, Ralph W. (RCA, Lancaster, PA) **Quantum efficiency of the eye determined by comparison with a TV camera.** *Journal of the Optical Society of America*, 1974(Dec), Vol 64(12), 1706-1710.—The corneal quantum efficiency of the eye was evaluated by comparing perception of a test chart by 6 30-59 yr old Os using dark-adapted vision, with the perception of the same chart using a solid-state, low-light-level TV camera and a monitor. Monochromatic radiation was used for the test. Irradiance of the scene was balanced for the 2 perception methods so that the same chart information was observed in both cases. The quantum efficiency of the eye was then deduced from the ratio of the 2 irradiance levels, the apertures of the eye and of the camera lens, and the quantum efficiency of the 1st photocathode of the TV tube. Results show the quantum efficiency of the eye to be in the range of 1-4%. The

experiment was limited to radiation levels equivalent to starlight and 2 orders of magnitude higher.—*Journal abstract.*

10828. **Filin, V. A.; Ananin, V. F. & Dymov, M. V.** (Scientific Research Inst of Medical Instrument-Making, Moscow, USSR) [Involuntary eye movements in the recognition of punctiform objects.] (Russ) *Voprosy Psikhologii*, 1974(Jul-Aug), No 4, 128-132.—Describes the difference in the nature of eye movements obtained with 6 Ss viewing stimuli that subtended angles of 15' under instructions to fixate a spot, to fixate a digit, or to recognize a digit.—*L. Zusne.*

10829. **Foley, J. M.** (U California, Santa Barbara) **Error in visually directed manual pointing.** *Perception & Psychophysics*, 1975(Jan), Vol 17(1), 69-74.—Errors in pointing at visual targets without sight of the hand or arm were measured in 8 normally seeing young adults for both hands in 2 cue conditions. The existence of large errors of overreaching, which increase as cues are reduced, was confirmed. These varied with target distance but not appreciably with the hand used or the target direction. Large lateral errors were also found. These could be reasonably well described by rotations about the midpoint of the eyes. Their magnitude and direction depended on the S and the hand used but were largely independent of cue condition and distance. The mean angular error across Ss taken without regard to sign was 4.8°. The mean difference between hands was 5.2°. The effect of eye dominance expected under G. L. Walls's (1951) and K. N. Ogle's (1962) hypothesis was not obtained.—*Journal abstract.*

10830. **Fox, John.** (MRC Applied Psychology Unit, Cambridge, England) **The use of structural diagnostics in recognition.** *Journal of Experimental Psychology: Human Perception & Performance*, 1975(Feb), Vol 104(1), 57-67.—Examines the suggestion of L. E. Krueger (see PA, Vol 50:10310) and others that wholistic processes underlie certain perceptual judgments. It is argued that properties such as bilateral symmetry can have a "diagnostic" significance for visual matching tasks. Diagnosticity means that if the property is present the appropriate response to a stimulus could theoretically be determined without any other analysis of the stimulus. 5 experiments were conducted, using a total of 32 right-handed naval enlisted men. Results of Exps I and II indicate that symmetry is exploited as a diagnostic property for the simultaneous same-different judgment. Displays that show the diagnostic form produce short reaction times. Results also show that the diagnosticity effect can be demonstrated independent of potentially confounding factors such as simplicity or redundancy. Findings of Exps III, IV, and V discount further confounding factors and also show that other properties, notably parallelism and colinearity of stimulus elements, can also be exploited as diagnostics in the simultaneous matching task. Diagnostics can have a structural or relational form. Diagnostic features are viewed as 2-place structural predicates. Whether these diagnostics always have the same underlying form or not, the need for some representation of structure is a prerequisite for understanding even these simple recognition phenomena.—*Journal abstract.*

10831. **Garner, W. R. & Sutliff, Donna.** (Yale U) **The effect of goodness on encoding time in visual pattern discrimination.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 426-430.—Previous results have implied that pattern goodness, as defined by rotation-reflection equivalence set size, is a determinant of encoding time. A direct test of this implication was made via a discrete reaction-time (RT) task using good and poor dot patterns presented to 9 right-handed graduate and undergraduate Ss in a 2-stimulus discrimination. The following discrimination conditions were used: (1) good vs good, (2) poor vs poor, and (3) good vs poor. Overall RTs for Conditions 1 and 3 were equal, but each was significantly faster than Condition 2. In the 1st 2 conditions, there was no difference in RT within pairs and no consistent transitive ordering of the patterns. In Condition 3, however, the good pattern consistently produced the smaller RT. Results indicate that patterns of equal goodness were equally encodable, and the better the pattern, the faster it was encoded. In addition, there was evidence that pattern similarity affects RT.—*Journal abstract.*

10832. **Götz, Karl O. & Götz, Karin.** (Academy of Fine Arts, Dusseldorf, W Germany) **Color preferences of art students: Surface colors: I. Perceptual & Motor Skills**, 1974(Dec), Vol 39(3), 1103-1109.—In K. O. Götz and K. Götz's (see PA, Vol 52:7599) study with imagined colors, the statistical significance of the frequency distribution over the categories of a given preference scale were tested separately for each single color. For art students, only red and blue were pleasant, while gray and pink were unpleasant colors, black and white counted as neutral, and the distributions of all other colors listed were not statistically different from chance. In the present study with 14 surface colors, the results for 113 male and 77 female art students are similar with the exception of yellow and orange, which ranged among the highly preferred colors. The only sex difference was for green. The limitations of the present work are discussed.—*Journal abstract.*

10833. **Hennessy, Robert T. & Richards, Whitman.** (Human Factors Research, Goleta, CA) **Contrast sensitivity and viewing distance.** *Journal of the Optical Society of America*, 1975(Jan), Vol 65(1), 97-98.—Reports experimental findings which confirm those of C. R. Cavonius and R. Hiltz (see PA, Vol 51:4192) which show no change of contrast sensitivity dependent on accommodation and convergence distance of sinusoidal targets ranging from 1-60 c/deg. It is concluded that accommodation and convergence have an effect on sinusoidal contrast sensitivity of less magnitude than does 0 variability.

10834. **James, Carlton T.** (Rutgers State U, New Brunswick) **Vowels and consonants as targets in the search of single words.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 402-404.—Conducted a study of 12 undergraduates to investigate the hypothesis that eliminating lower case cues would destroy the vowel advantage in word recognition search tasks. Ss searched 4- and 6-letter words typed in uppercase for predesignated target letters. Results show that reaction times for vowel targets were faster than to consonant targets for both stimulus lengths; this was true whether or not the

target was contained in the stimulus word. It is suggested that an early stage in word perception is the location of vowels, as proposed by D. Hansen and D. Rogers (1968).—*Journal abstract.*

10835. Judd, Deane B. & Nickerson, Dorothy. **Relation between Munsell and Swedish Natural Color System Scales.** *Journal of the Optical Society of America*, 1975(Jan), Vol 65(1), 85-90.—Discusses the necessity for developing perceptually uniform color scales and uses simple formulas to demonstrate the degree to which Munsell hue, value, and chroma and the Swedish Natural Color System variables of blackness, whiteness, redness, yellowness, greenness, and blueness describe the same color space.

10836. Kitterle, Frederick L.; Kaye, Russell S. & Nixon, Heather. (U Toledo) **Pattern alternation: Effects of spatial frequency and orientation.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 543-546.—F. W. Campbell and E. R. Howell (1972) reported an effect called "monocular pattern alternation." They found that a pattern composed of 2 orthogonal sinusoidal gratings, one horizontal and the other vertical, underwent rivalry when viewed monocularly for a period of time. In the present 2 experiments with 14 undergraduate and 4 graduate students, respectively, it was shown that monocular pattern alternation depended upon the orientation of the pattern and the spatial frequency of its components. Fewer reversals were found for an obliquely oriented pattern than for a pattern with components in the horizontal and vertical meridians. Alternation rate was higher when the gratings were similar in frequency but differed in orientation than when the components of the pattern differed in both dimensions. It is concluded that pattern alternation reflects an antagonistic interaction between interdependent channels in the human visual system that respond to orientation and spatial frequency.—*Journal abstract.*

10837. Krekling, S. (U Trondheim, Inst of Psychology, NLHT, Norway) **Depth matching with visible diplopic images: Stereopsis or vernier alignment.** *Perception & Psychophysics*, 1975(Jan), Vol 17(1), 114-116.—Notes that, in order to prevent Ss from actually performing a judgment of vernier alignment between the double images rather than matching stereoscopic depth of the test objects, various precautions have previously been taken (e.g., using inexperienced Ss who were ignorant of the experimental situation and possible matching criteria). In the present experiment, an S was given training in observing double images, and the matching problems were also discussed. The S was then instructed to perform stereoscopic depth judgments. The comparison between these data and data based on vernier alignment judgments under similar conditions showed that knowledge about the experimental situation and the vernier alignment criterion did not interfere with the S's task of matching the stereoscopic depth between visible double images.—*Journal abstract.*

10838. Lord, Catherine & Haith, Marshall M. (Harvard U) **The perception of eye contact.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 413-416.—16 male and 16 female college students made judgments of whether or not they were being looked in the eye as an E fixated several points on and off their faces. Distance

between sender and receiver, sex, and whether the sender made a sequence of fixations prior to the terminal fixation were variables of interest. The sender-receiver distance produced less effect than predicted from the hypothesis that receiver judgments were determined solely by the discrepancy between the sender's iris-sclera configuration (ISC) during true eye contact and the current fixation point. There was no stable difference in accuracy as a function of whether the sender's terminal fixation was preceded by other fixations or not. Findings cast doubt on the belief expressed in recent studies that the ISC can be used to accurately discriminate eye gazes from other gazes. Results suggest that fixations on some portions of the face yield a judgment of eye contact which might be predicted on the basis of social experience.—*Journal abstract.*

10839. MacAdam, David L. (Eastman Kodak Co, Research Lab, Rochester, NY) **Uniform color scales.** *Journal of the Optical Society of America*, 1974(Dec), Vol 64(12), 1691-1702.—Judgments of relative magnitudes of color differences exhibited by 128 selected nearest-neighbor pairs of 59 colored tiles were recorded by groups of 49-76 Os with normal color vision. Scale values that represent the perceived magnitudes of the color differences were obtained by statistical analysis of their reports. From colorimetric specifications of the tiles, formulas were devised that define a 3-dimensional euclidean space in which the distances between the points that represent the colors correlate reasonably well with the reported magnitudes of the perceived color differences. Because of the manner of selection of the approximately 500 colors, each except the most saturated will exhibit equal magnitudes of color difference from 12 others. About 2500 equally noticeable color differences can be exhibited by suitable arrangements of those colors, and each except the most saturated can be arranged in 6 different series. Each of those series exhibits from 3 to 10 color differences, all of equal magnitude. Such a series of colors which exhibits equal color differences is known as a uniform color scale. (18 ref)—*Journal abstract.*

10840. Mackavey, William; Curcio, Frank & Rosen, Jeffrey. (Boston U) **Tachistoscopic word recognition performance under conditions of simultaneous bilateral presentation.** *Neuropsychologia*, 1975(Jan), Vol 13(1), 27-33.—Conducted 4 experiments involving the bilateral tachistoscopic presentation of word pairs to a total of 70 right-handed undergraduate volunteers. This paradigm generated a right hemifield recognition advantage across manipulations of word orientation, exposure duration, and fixation control. In 2 of the experiments this recognition asymmetry was maintained in spite of a significant tendency to initiate the verbal report with any available left hemifield content. In 3 of the experiments the strength of the left-to-right order of report tendency was negatively correlated with the magnitude of the right visual field recognition advantage. A hypothesis to account for the more common finding of left hemifield recognition superiority with bilateral displays is offered. (French & German summaries) (20 ref)—*Journal abstract.*

10841. MacLeod, Donald I.; Virsu, Veiho & Carpenter, R. H. (Florida State U, Inst of Molecular Biophysics) **On**

**mathematical illusions.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 417-418.—Criticizes E. H. Walker's (see PA, Vol 51:8284) paper on the grounds that its physiological premises lack support, that it misrepresents the theoretical position of C. Blakemore et al (see PA, Vol 46:2431), and that its theory is contradicted by existing evidence.

10842. Mershon, Donald H. & Gogel, Walter C. (North Carolina State U, Raleigh) **Failure of familiar size to determine a metric for visually perceived distance.** *Perception & Psychophysics*, 1975(Jan), Vol 17(1), 101-106.—Explored the notion that familiar size cue to distance might be one of the factors responsible for supplying the metric (scalar) characteristics of perceptions of spatial extent within a visual display in which other information concerning scalar extents has been reduced to a minimum. 2 groups of 20 normally seeing undergraduate Os each were presented with realistic objects of the same angular, but different assumed, sizes presented in such a cue-restricted display. Perceptions of size and distance within the display did not differ significantly as a function of the type of object initially presented. This result suggests that scalar perceptions under these conditions probably are determined by a factor known as the specific distance tendency, rather than by the experiential factor of familiar size.—*Journal abstract.*

10843. Murphy, Brian J.; Haddad, Genevieve M. & Steinman, Robert M. (U Maryland) **Simple forms and fluctuations of the line of sight: Implications for motor theories of form processing.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 557-563.—Used a contact lens optical lever to measure 2-dimensional fixation characteristics when 2 experienced Ss fixated at various positions within simple forms small enough to fall entirely on the foveal floor ( $< 80$  min). Fixation stability and the average direction of the line of sight were not markedly or systematically affected by the shape of the fixation stimulus. Similar results were obtained when all saccades were suppressed and the line of sight maintained exclusively by means of slow control. These results cast doubt on motor theories of form perception. (20 ref)—*Journal abstract.*

10844. Oetting, Daniel R. & Oetting, E. R. (Colorado State U) **Preliminary observations on a visual perception illusion.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1290.—Describes an illusion in which, when a moving object is dimly lighted and includes bright-light-emitting diodes, at certain rates the diodes and object appear to move separately. Under some conditions, brighter parts of a visual field may be perceived more rapidly.

10845. Olson, Richard K. (U Colorado) **Children's sensitivity to pictorial depth information.** *Perception & Psychophysics*, 1975(Jan), Vol 17(1), 59-64.—Tested 16 40-64 mo old children for sensitivity to interposition, height in field, linear perspective, and retinal size under either restricted (monocular, head motionless) or unrestricted (binocular, head free) picture surface viewing conditions. All of the Ss' relative depth responses (near vs far) to 2 toy houses were remarkably accurate with interposition and/or height in field pictorial depth information. Retinal size had relatively little control over

their responses, and the addition of linear perspective resulted in no significant improvement. Performance was nearly equivalent under the 2 viewing conditions, indicating young children's ability to take a "pictorial attitude."—*Journal abstract.*

10846. Pinkerton, Elizabeth & Humphrey, N. K. (Admiralty Research Lab, Applied Psychology Unit, Teddington, England) **The apparent heaviness of colours.** *Nature*, 1974(Jul), Vol 250(5462), 164-165.—10 male and 10 female Ss adjusted a fulcrum-like pointer to indicate subjective relative weight differences between pairs of visual stimuli consisting of 1 colored and 1 white disk, previously equated for subjective brightness, or between pairs of white disks differing in brightness. Relative weight was inferred from the pointer's displacement in centimeters from its original position midway between disks. Results show that colors were judged significantly heavier than white ( $p < .001$ ) while differences between brightness of white disks, or between males' and females' settings were not significant. Judged weight consistently decreased in the following order: red, blue, green, orange, yellow, with red significantly heavier and yellow significantly lighter than the other colors. Data are interpreted in terms of possibly indirect linguistic associations of a color's importance, subjective pleasantness of colors, or color preference.—A. Cerf-Bearre.

10847. Redding, Gordon M. (Illinois State U) **Simultaneous visuomotor adaptation to optical tilt and displacement.** *Perception & Psychophysics*, 1975(Jan), Vol 17(1), 97-100.—Measured change in visuomotor direction and orientation following simultaneous exposure of 5 separate groups of 16 right-handed Ss each to optical displacement and tilt. Adaptation to both transforms simultaneously was not different from adaptation to each transform separately. Results are consistent with previous work involving purely visual change and suggest that the 2 kinds of adaptation involve independent processes for locus-specific and relational analysis. (15 ref)—*Journal abstract.*

10848. Richards, Whitman & Foley, John M. (Massachusetts Inst of Technology) **Effect of luminance and contrast on processing large disparities.** *Journal of the Optical Society of America*, 1974(Dec), Vol 64(12), 1703-1705.—Conducted a study with the authors as Os in which, although reduced luminance impaired the discrimination of small disparity stimuli, large-disparity discrimination improved. Crossed and uncrossed stimulus disparities of  $4^\circ$  that were not discriminated at photopic levels were easily discriminated at mesopic levels near the color threshold. This improvement of stereo processing appeared to be dependent upon an effective contrast reduction produced neurally, because a physical reduction of contrast without a change of background luminance also improved large-disparity stereopsis.—*Journal abstract.*

10849. Riggs, Lorrin A.; White, Keith D. & Elmas, Peter D. (Brown U) **Establishment and decay of orientation-contingent aftereffects of color.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 535-542.—Conducted a study with 6 Os (the authors, an undergraduate, and 2 research assistants) in which, in achromatic test gratings, green horizontal lines appeared pinkish and

indicate that (a) female Ss showed a greater time-related performance decrement in correct detections than males in the regular-intermittent background condition, (b) RTs increased with time, (c) males responded more rapidly than females, (d) intermittent noise attenuated time-related changes in incorrect detections, (e) males made more incorrect detections than females in the intermittent background conditions but not in the constant-background conditions, and (f) there was a Sex  $\times$  Trial Block interaction ( $p < .01$ ) in the constant noise condition. Several correlations between and within response measures are reported. (30 ref)—*Journal abstract*.

10856. Walker, Evan H. (US Army Ballistic Research Lab, Aberdeen Proving Ground, MD) **On spurious allusions. *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 419-425.**—Demonstrates that the criticisms of E. H. Walker's (see PA, Vol 51:8284) theory by D. I. MacLeod et al (see PA, Vol 53:Issue 6) stem from a too simple reading of the text of the theory, a failure to investigate fully the references cited to support their position, and an effort to bolster the theory of lateral inhibition in orientation detectors. The criticisms are shown to misrepresent the experimental data of various reports. Walker's physiological premises are shown to be sound, and the cases of "contrary evidence" are shown in fact to be in agreement with the theory. Lateral inhibition in orientation detectors as an explanation of optical illusions is shown to fail completely to agree with experimental results. (24 ref)—*Journal abstract*.

10857. Wolford, George & Hollingsworth, Samuel. (Dartmouth Coll) **Retinal location and string position as important variables in visual information processing. *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 437-442.**—Conducted 3 experiments with a total of 33 normally seeing undergraduate Ss to isolate the effects of retinal locus and string position in tachistoscopic letter recognition. Retinal locus proved to be an important variable even when its range was restricted to less than a degree from the center of the fovea. Performance was maximal at the center of the fovea, dropping off rapidly to about 1.5° from the center. From that distance on, the decline in performance was quite gradual. String position was also an important factor. Retinal locus and string position interacted in such a way that the end positions were less affected by retinal locus than the middle positions. It was also found that processing order, as distinct from report order, was a significant component of the string position effect.—*Journal abstract*.

10858. Wong, S. F. & Borresen, C. R. (Wichita State U) **Effect of delay of feedback and type of movement on laterally displaced vision. *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1331-1336.**—144 male and female volunteers were run in an experiment investigating the effects of type of movement (active vs passive), type of feedback (none, delayed, immediate), and the interaction effect on laterally displaced vision. The main hypothesis was that delayed feedback would be particularly effective under the condition of passive movement. While the main hypothesis was not supported, several secondary ones were supported. The hindering effect of the lack of significance of the main effect of type of movement on other hypotheses is pointed out.—*Journal abstract*.

## Motor Processes & Performance

10859. Beggs, W. D.; Sakstein, Ruth & Howarth, C. I. (U Nottingham, England) **The generality of a theory of the intermittent control of accurate movements. *Ergonomics*, 1974(Nov), Vol 17(6), 757-768.**—Develops equations to describe target aiming, accurate line drawing movements, and driving skill, each containing a measure of the angular accuracy of aiming. Employing 12 normally seeing right-handed undergraduates, it was hypothesized that the measures of angular accuracy for the different tasks are related to each other, are a characteristic of the S, and that ability in such tasks is correlated. However, no significant correlation in performance was found in nonvisual target aiming, line drawing, and walking along beams of different width. Despite this failure, the data in each case fitted the theoretical equations very well, both for individual Ss and when collapsed across Ss. It is concluded either that the angular error of aiming is characteristic only of S-task interaction or that other parameters in the equations vary considerably from task to task. (French & German summaries) (17 ref)—*Journal abstract*.

10860. Bense, Carolyn K. & Lockhart, J. M. (US Army Natick Lab, Pioneering Research Lab, MA) **Cold-induced vasodilatation onset and manual performance in the cold. *Ergonomics*, 1974(Nov), Vol 17(6), 717-730.**—Investigated manual dexterity capabilities during whole-body cold exposure as a function of time to vasodilatation during local cooling. 30 male US Army volunteers were divided into 3 equal groups on the basis of the time for a 1.7°C rise in index finger temperature during immersion of the hand in 4.4°C water: <450-sec, 450-900 sec, and >900-sec groups. Subsequently, each S was exposed to ambient temperatures of 15.6° and -6.7°C for 3 hrs while performing a battery of 6 manual tasks bare-handed. Manual performance on all tasks was affected adversely at the -6.7°C ambient and worsened with continued cold exposure. The drop in performance on 3 tasks involving skilled movements of the wrist and fingers was greatest for the <450-sec group. The early onset of vasodilatation in local cooling per se appeared to be associated with initially superior performance and subsequently inferior performance on specific manual tasks with increasing durations of whole-body cold exposure. (French & German summaries) (16 ref)—*Journal abstract*.

10861. Galanter, Eugene & Owens, J. A. (Columbia U, Psychophysics Lab) **The independence of the simple reaction time on key force. *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 115.**

10862. Levy, C. Michael & Bowers, Dawn. (U Florida) **Hemispheric asymmetry of reaction time in a dichotic discrimination task. *Cortex*, 1974(Mar), Vol 10(1), 18-25.**—Manual reaction times (RT) to a verbal target stimulus, embedded in a series of dichotically presented digits, were measured in 40 dextral Ss. The major finding was an asymmetry of RTs: RT to target stimuli was 132 msec faster in the right ear than in the left. The magnitude of the asymmetry was almost 2.5 times greater for this complex discrimination task than that found previously in studies involving simple stimulus detection, suggesting that differential processing time is

an important function of task complexity and mediational demands.—R. Gunter.

10863. Lockhart, John M.; Kiess, Harold O. & Clegg, Thomas J. (US Army Natick Lab, MA) **Effect of rate and level of lowered finger surface temperature on manual performance.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 106-113.—Tested 32 Army enlisted men on 6 manual tasks when the right forefinger surface temperature was either not lowered (control condition) or lowered to temperatures of 65°, 55°, and 48° Fahrenheit (18.3°, 12.8°, and 8.9° Centigrade) after 5 or 50 min of cooling. Performance on all tasks decreased with lowered surface temperature. The level of finger surface temperature associated with impaired performance and the extent of the performance decrements associated with additional cooling varied across tasks and cooling rate. The differential effects of local cooling on manual performance across tasks and cooling rates were analyzed in terms of the differential susceptibility of hand function to parameters of cold exposure and the selective requirements across aspects of manual performance for unimpaired functioning of the hands and arms.—*Journal abstract*.

10864. Metz, L. Daniel. (U Illinois) **The potential for systems theory application to studies of motor performance.** *Human Factors*, 1974(Oct), Vol 16(5), 514-519.—Considers that motor performance calls into play a number of complex physiological and biological systems. An understanding of the function and behavior of such systems is necessary if motor performance is to be properly analyzed and helpful if it is to be improved. The concepts of systems and control theory offer a powerful (though sometimes not fully exploited) methodological technique for achieving such an understanding. Some of the elementary concepts of systems theory as applied to motor performance are discussed, and qualitative discussions of its usefulness in that field are presented. (15 ref)—*Journal abstract*.

10865. Nakamura, R. & Salto, H. (Tokyo Metropolitan Inst for Neurosciences, Japan) **Preferred hand and reaction time in different movement patterns.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1275-1281.—Examined the difference in reaction time (RT) for right and left biceps, acting on the forearm in 2 different movement patterns, flexion and supination, for 7 right-handed and 7 left-handed 25-48 yr old normal adults. The task was to flex or supinate both forearms simultaneously in response to a sound stimulus. Median RTs of each S were computed for each movement task. Analysis indicated that RT of supination was faster than that of flexion. Concerning left-right difference of RT, the flexion of the nonpreferred hand was faster than that of the preferred hand, and the supination of the preferred hand was faster than that of the nonpreferred. Even in a simple movement there were differences in RTs for the right and left hands which did not depend on the muscles but on the movement patterns. It is concluded that hemispheric dominance is not established by comparing the rapid initiation of movement.—*Journal abstract*.

## COGNITIVE PROCESSES AND MOTIVATION

10866. Ackles, Patrick K.; Zimmermann, Robert R.; Manning, Mark & Kazarian, Charles. (Central Michigan U) **Transposition in young monkeys and children.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1291-1298.—Trained 30 young rhesus monkeys with discrimination learning experience and 30 1st graders to discriminate stimulus pairs which differed in either brightness, volume, or volume plus brightness. After achieving the criteria of learning, Ss were tested for transposition on a fixed number of trials with stimulus pairs along the same dimension. The order of the near and far tests of transposition was counterbalanced. Both monkeys and children made the fewest errors in learning and transferring on the compound stimulus dimension. The most errors were made in learning and transfer on the brightness stimuli and on the far test condition. The order of transposition testing, and the interactions of Order  $\times$  Near-Far Test condition, Stimulus Dimension  $\times$  Near-Far condition, and Order  $\times$  Near-Far  $\times$  Stimulus were significant sources of variance for the monkeys. Monkeys tested on the far test first made fewer errors on subsequent tests, and the magnitude of the reductions was most dramatic in the brightness condition. Results are interpreted in terms of stimulus differentiation in perceptual learning which assumes that relative differences among stimuli are valid sources of information. (17 ref)—*Journal abstract*.

10867. Anokhin, P. K. [The problem of decision-making in psychology and physiology.] (Russ) *Voprosy Psikhologii*, 1974(Jul-Aug), No 4, 21-29.—Presents a paper delivered at the Moscow Institute of Psychology on January 23, 1974. Decision making is viewed not as an isolated problem or an isolated mechanism but as part of a larger system. The actual decision making moment is preceded by complex predecision events. Motivation and memory always enter the picture, determining the form that decision making takes, its type, and its general characteristics. Motivation acts to select from memory all those elements in the individual's life that have corresponded to satisfying the motive. The particular mode of satisfying a motive, however, depends on existing environmental conditions. Physiologically, decision making occurs on the level of single neurons and on the level of the whole brain as an integrated system. The problem is to understand the process of information reduction in the nervous system, so that, as the degrees of freedom available for operation to a single neuron and neuron groups are reduced, a goal-directed, integrated, and organized functioning of the whole brain in the process of decision making is achieved.—L. Zusne.

10868. Banks, William P.; Clark, Herbert H. & Lucy, Peter. (Pomona Coll) **The locus of the semantic congruity effect in comparative judgments.** *Journal of Experimental Psychology: Human Perception & Performance*, 1975(Feb), Vol 104(1), 35-47.—Tested a 2-stage model for a "semantic congruity effect" in comparative judgments in 2 experiments with 26 undergraduates as Ss. When Ss were asked to choose the higher or the lower of 2 balloons tethered at the ends of strings, they were faster at choosing the higher of the 2, but when asked to choose the higher or the lower of 2 yo-yos hanging at the

ends of strings, they were faster at choosing the lower one. By hypothesis, this occurred because the balloons were coded at a 1st perceptual stage in term of highness and the yo-yos in terms of lowness; then, at the 2nd linguistic stage, the perceptual codes that matched the instructional codes ("choose the higher" or "the lower") resulted in the faster judgments. Results demonstrate that (a) the 2 stages are sequential, since changes in pairwise stimulus discriminability and in instructions had additive effects on the total reaction time and (b) the presence of the semantic congruity effect depended on the actual perceptual codes applied to the stimuli. —*Journal abstract.*

10869. Bossewitsch, Kenneth. (City Coll, City U New York) **The effects of practice and expectation upon productivity in problem solving.** *Graduate Research in Education & Related Disciplines*, 1974(Spr-Sum), Vol 7(2), 5-31.—Sought to determine the influence of practice and expectation on 1 aspect of creativity and originality in problem solving, i.e., productivity. 56 Ss were evenly divided and arbitrarily assigned to 1 of 4 experimental conditions. Each S received the Unusual Uses test (UUT) for a watch problem. Ss in the practice groups received the UUT for a safety-pin problem just before the watch problem. In 2 groups, expectation for many responses was induced by special instructions. Results of a 2-way analysis of variance support the 3 hypotheses that (a) different instructions significantly increase productivity; (b) specific practice significantly increases productivity; and (c) there is no significant interaction between practice and expectations. It is concluded that the ability to develop high quality solutions may be upgraded without extensive training, environmental manipulation, or massive personality changes. (28 ref)—*C. Tatham.*

10870. Dockstader, Steven L. (U Denver) **The blank trials effect: A review of the literature.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 116.

10871. Henderson, Leslie & Henderson, Sheila E. (Hatfield Polytechnic, England) **Visual comparison of words and random letter strings: Effects of number and position of letters different.** *Memory & Cognition*, 1975(Jan), Vol 3(1), 97-101.—12 undergraduates made same-different judgments of tetragrams. Stimuli were either words or consonant strings. In the case of different pairs, the number and position of letters different were controlled. Words were compared faster than random strings under all conditions. Consistent effects of the number and position of letters different suggest that word superiority is not due to phonemic recoding. For both words and consonant strings "same" reaction time (RT) to a given pair was faster when it was from a block in which "different" pairs had 3 rather than 1 letter different. This suggests that the wholistic identity reporter involves a criterion process sensitive to the magnitude of expected differences. Different RTs were faster in all conditions for 3-letter different pairs rather than 1-letter different pairs, ruling out a fixed order self-terminating search process for "different" decisions. (20 ref)—*Journal abstract.*

10872. Kleiter, Gernot D. (U Salzburg, Psychologisches Inst, Austria) **[Multistage decision making models in psychology.]** (Germ) *Psychologische Beiträge*, 1974, Vol

16(1), 93-127.—Reviews theoretical foundations and empirical investigations of multistage decision making. Examples taken from the psychology of thinking and the psychology of motivation are used to point to the relations of the theory to information processing. (French summary) (5 p ref)—*English summary.*

10873. Kuchmenko, A. I. **[The effects of different learning situations on mental performance of high school students as a function of the strength and equilibrium of nervous processes.]** (Russ) *Voprosy Psikhologii*, 1974(Jul-Aug), No 4, 52-58.—Measured the strength and equilibrium of the nervous processes of 54 high school students, using conditioning methods, and observed their performance of well-rehearsed mathematical skills in 6 problem-solving situations differing in the degree of anxiety and motivation involved. The correlations obtained between these 2 sets of measures are interpreted as indicating that individuals with different nervous systems react differently to the same problem situation if the attending conditions differ. Individuals showing a strong nervous excitation process worked faster than individuals with a weak nervous system when the level of motivation and anxiety was moderate or low. In work requiring a high level of motivation no difference between these 2 types was found. The differential effect of the degree of nervous equilibrium appeared only in practice situations and competition for individual honors involving both speed and accuracy. (English summary) (20 ref)—*L. Zusne.*

10874. Lichtenstein, Sarah; Earle, Timothy C. & Slovic, Paul. (Oregon Research Inst, Eugene) **Cue utilization in a numerical prediction task.** *Journal of Experimental Psychology: Human Perception & Performance*, 1975(Feb), Vol 104(1), 77-85.—Trained 40 male university students to make numerical predictions of a criterion from a cue. Ss were trained on 2 separate cues that differed in validity. Later, the cues were presented together, simultaneously for 20 Ss and successively for the rest. Ss were asked to use both cues to predict the criterion. A regression model provided an adequate fit to the data, and the Ss showed conservatism similar to the conservatism found in previous Bayesian inference studies. However, further analyses showed consistent deviations from the normative model. The post hoc hypothesis that Ss were regressing each cue, then averaging the regressed values, was supported. Searching for heuristic strategies, rather than relying on the apparent fit of normative models, was advocated. (19 ref)—*Journal abstract.*

10875. Marcel, Tony. (MRC Applied Psychology Unit, Cambridge, England) **The effective visual field and the use of context in fast and slow readers of two ages.** *British Journal of Psychology*, 1974(Nov), Vol 65(4), 479-492.—Examined the amount read from the second of 2 successive fixations in 30 adults before and after a "speed-reading" course and in 48 fast and slow 11-yr-old readers, as a function of contextual constraint. Faster readers benefited more from increased contextual constraint. Errors related only visually to the display decreased with increased constraint; errors both grammatically and visually related increased more in faster than slower readers, and more so than predicted by the relative increase found in purely grammatically related

errors. It is concluded that more effective use of context enlarges the effective visual field in 2 ways. With greater contextual priming, less sampling of visual information is necessary for word recognition, allowing more capacity for visual processing on the periphery. In addition, faster children, but not adults, showed an advantage even in sequences without contextual constraint. In the fastest readers of both ages, a type of semantically related error was found which suggests a further mechanism of rapid reading. (28 ref)—*Journal abstract*.

10876. McDonald, Roy D. & Smith, John R. (California State U, San Diego) **Trance logic in tranceable and simulating subjects.** *International Journal of Clinical & Experimental Hypnosis*, 1975(Jan), Vol 23(1), 80-89.—Investigated double hallucination and transparency of hallucination as criteria of trance logic. 18 highly tranceable Ss and 17 refractory simulators were chosen from a group of psychology student volunteers, using scores on the Harvard Group Scale for Hypnotic Susceptibility, Form A, and the Stanford Hypnotic Susceptibility Scale, Forms B and C. While no statistically significant differences were found between these 2 groups on these 2 dimensions of trance logic, there are suggestions in the data which support the trance-logic phenomenon. 3 spontaneous reports of transparency of the positive hallucination were made by tranceables, while none occurred in the simulating group. Methodological issues in assessing the uniqueness of the hypnotic state are discussed, and suggestions are made to improve future investigations of the problem. (German, French, & Spanish summaries) (20 ref)—*Journal abstract*.

10877. Messick, Samuel & French, John W. (Educational Testing Service, Princeton, NJ) **Dimensions of cognitive closure.** *Multivariate Behavioral Research*, 1975(Jan), Vol 10(1), 3-16.—Investigated the generality of the perceptual factors of speed and flexibility of closure in the cognitive domain. Several experimental measures of both flexibility and speed of closure employing perceptual or figural content, verbal or symbolic content, and semantic content were administered to 541 US Naval Aviation Cadets, along with marker measures for several established factors. In addition to several of these marker dimensions, factors were obtained for both Flexibility and Speed of Figural Closure, of Verbal or Symbolic Closure, and of Semantic Closure, along with a dimension tentatively interpreted as Flexibility of Grammatical Closure. The substantial intercorrelations among these factors yielded 4 2nd-order dimensions, interpreted as Analytical Functioning or General Reasoning, Figural Closure, Symbolic Closure, and Semantic Closure. The latter 3 factors each represent a combination of analytical and structuring skills (a coalescence of flexibility and speed of closure) and are distinguished by the type of content involved (figure, symbol, or meaning). (15 ref)—*Journal abstract*.

10878. Polivanova, N. I. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General & Pedagogical Psychology, Moscow) **[Functional and structural aspects of the visual components of intuition in problem solving.]** (Russ) *Voprosy Psikhologii*, 1974(Jul-Aug), No 4, 41-51.—Studied the solution of various forms of the travelling salesman problem, with special emphasis on the visual aspects of the solution. It

is concluded that the visual aspects may lead to operations based on readily apparent and directly perceived geometric relationships, which, however, the problem-solver is not aware of. These operations predominate in the problem-solving process or play a role equal to that of the logical and analytical processes. Visual components of problem solving interact with the processes of logic and serve the heuristic function of narrowing down the region of search and of formulating hypotheses that give direction to the search process. They involve visual logic, which orients itself toward points of concentrated information in the problem situation. The identification of such points occurs when problem elements are augmented by the appearance of additional, holistic aspects of the problem situation in the process of visual information encoding. Attention to these holistic aspects allows the simultaneous reckoning of a number of simpler elements which, taken alone, do not guarantee a successful solution of the problem. (English summary)—*L. Zusne*.

10879. Rudestam, Kjell E.; Sherman, Richard C. & Jarnecke, Roy. (Miami U) **Effect of lens-model and outcome feedback in a social judgment analogue.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1223-1233.—96 undergraduates judged the correct category designations of human-like figures which differed with respect to 4 facial cues, a task designed so that the correct category was defined by a linear function of the cues. Ss were randomly assigned to 1 of 4 feedback conditions in which they received (a) traditional "right" vs "wrong" feedback after each trial, (b) the correct category of each figure, (c) the values of each cue for each figure, or (d) the linear function relating the cues to the categories. Results are analyzed by L. Tucker's (1964) modification of the Brunswikian lens model equations. Ss who received "lens" feedback were found to gain significantly more knowledge of the task system than Ss in traditional outcome feedback conditions, exercise significantly greater control over that knowledge, and achieve a significantly higher level of accuracy in their judgments. (16 ref)—*Journal abstract*.

10880. Russell, Paul N. (U Canterbury, Christchurch, New Zealand) **A measure of similarity between separate categorizations of to-be-remembered words.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1150.—Describes a method of quantifying the degree of similarity between separate categorizations in a task which requires an S to recall and organize words, and of determining to what extent the S uses the same modes of categorization on repeated categorization trials.

10881. Shanon, Benny. (Massachusetts Inst of Technology) **The two meanings of a homophone.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 571-574.—12 university students who were native speakers of English were presented with sentences whose main noun was either a homophone or not. Following each sentence, Ss were presented with a single noun and had to indicate whether it was relevant to the sentence. More specifically, irrelevant probes following sentences containing homophones were either irrelevant with respect to both interpretations of the homophone or irrelevant with respect to the present interpretation of the homophone but relevant with respect to its other interpretation. Data

suggest that people compare the main noun and the probe, and that in doing so they compute both entries of the homophone noun. No effect was found due to a variation in the delay between the presentation of the sentence and the presentation of the probe.—*Journal abstract*.

10882. Spoehr, Kathryn T. & Smith, Edward E. (Rutgers State U, Douglass Coll) **The role of orthographic and phonotactic rules in perceiving letter patterns.** *Journal of Experimental Psychology: Human Perception & Performance*, 1975(Feb), Vol 104(1), 21-34.—Examined the role of orthographic and phonotactic rules in the tachistoscopic recognition of letter strings in 3 experiments using a total of 45 high school, college, and graduate students as Ss. Exp I showed that the presence of a vowel or multiletter spelling patterns facilitates perceptual accuracy. To account for these results a model was proposed in which an input string is first parsed into syllablelike units, which are then recoded into speech. It was demonstrated that the perceptual accuracy for a string is correlated with the number of recoding steps needed to convert that string into speech. Exp II further demonstrated that this recoding process can predict perceptibility differences among strings with varying numbers of phonotactic violations, and Exp III assessed some of the specific assumptions of the recoding process. (17 ref)—*Journal abstract*.

10884. Atkinson, Richard C. & Raugh, Michael R. (Stanford U) **An application of the mnemonic keyword method to the acquisition of a Russian vocabulary.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Mar), Vol 104(2), 126-133.—Evaluated the effectiveness of a mnemonic procedure, the keyword method, for learning a foreign language vocabulary. The method used divides the study of a vocabulary item into 2 stages. The 1st stage requires the S to associate the spoken foreign word with an English word, the keyword, that sounds like some part of the foreign word; the 2nd stage requires him to form a mental image of the keyword interacting with the English translation. The experiment compared the keyword method with an unconstrained control procedure using Russian vocabulary. Ss were 52 undergraduates. On all measures the keyword method proved to be highly effective, yielding for the most critical test a score of 72% correct for the keyword group compared to 46% for the control group.—*Journal abstract*.

10885. Bäumlér, Günther. (Technische U München, W Germany) **[An experimental contribution to Ebbinghaus' paradigm for learning "derived lists."]** (Germ) *Zeitschrift für Experimentelle und Angewandte Psychologie*, 1974, Vol 21(4), 499-510.—Avoided methodological objections to Ebbinghaus's experiments with derived lists by presenting as initial learning experience a different random sequence of the same 24 nonsense syllables to each of 46 Ss, asking them to write down as many items

as they could remember in proper sequence. The average performance after 4 repetitions was 67% of the items. In order to prevent Ss from rehearsing after the learning session, they were requested to perform the placing test of the Minnesota Rate of Manipulation Test immediately afterwards. 24 hrs later different groups of Ss relearned parts of the original lists. Group 1a relearned the 1st 8 items of their original sequence again; Group 1b relearned the 2nd 8; Group 1c the last 8 items. Group 2 learned 8 items in a derived 1st-order list, 2a the 1st 8 odd items, and 2b the last 8 even items of their original lists. Group 3 learned 8 items in a derived 2nd-order list; 3a items 1,4, . . . 22; 3b items 2,5, . . . 23; and 3c items 3,6, . . . 24. Comparison of the time needed by Groups 1, 2, and 3 to relearn 8 items and of the errors made confirmed Ebbinghaus's model of remote associations. Group 3 needed significantly more time and made most errors. (English & French summaries)—*W. J. Koppitz*.

10886. Buschke, Herman. (Albert Einstein Coll of Medicine, Yeshiva U) **Two stages of learning by children and adults.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 392-394.—Attempted to show that verbal learning in 10 children (mean age = 9 yrs), 10 young adults (mean age = 22.9 yrs), and 10 older adults (mean age = 42.2 yrs) could be analyzed in terms of 2 stages of (item and list) learning, amplifying previous analysis in terms of storage, retention, and retrieval from long-term storage. Consequently, repeated attempts were made to retrieve a 20-item list without confounding by any further presentation of items after their first recall. 2 separate stages of learning were indicated by the failure of retrieval to increase until the abrupt onset of perfectly consistent spontaneous retrieval.—*Journal abstract*.

10887. Carlson, J.; Goldman, R.; Bollinger, J. & Wiedl, K. H. (U California, Riverside) **[The effect of verbalizing the problem on different problem types and methods of presentation of the Raven Progressive Matrices Test.]** (Germ) *Diagnostica*, 1974, Vol 20(4), 133-141.—Examines the effect of verbalizing the problem on the ability to solve 10 perceptual and 10 conceptual items of the Raven Coloured Progressive Matrices Test. In a test of 32 children 7-8 yrs old the 20 items were presented as pictures and as puzzles. When Ss were instructed to verbalize the problem, better performance was achieved on perceptual items presented as puzzles.—*M. Morf*.

10888. Ciccone, Donald S. & Brelsford, John W. (Rice U) **Encoding specificity: The processing of stimulus attributes.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Jan), Vol 104(1), 60-64.—By holding task and instructional variables constant, an attempt was made to show that the method of stimulus presentation can determine the type of processing an item receives (i.e., which features, semantic, structural, or both, are implicated during encoding). The encoding of semantic vs structural stimulus attributes was manipulated by presenting 20 undergraduates with either a meaningful or a random sequence of common adjectives and nouns. The encoding of semantic information in the meaningful condition and the lack of such processing in the random condition were indicated by their relative

false alarm rates to certain high-associate distractors in a subsequent test of recognition. An analysis of each group's recognition performance indicated that a semantic as compared to a structural processing strategy led to a reduced hit rate but did not significantly increase the overall false alarm rate. It is suggested that if a recognition response depended primarily upon the physical attributes of the stimulus, then a structural rather than a semantic encoding strategy would be most efficient.—*Journal abstract.*

10889. Clement, Marc A. & Anderson, Daniel R. (U Massachusetts, Amherst) **Strategies in learning redundant relevant cues in concept identification.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Mar), Vol 104(2), 209-214.—In 2 experiments a total of 320 undergraduates were given a redundant relevant cues concept identification problem. Results indicate that (a) most Ss who learn about both relevant cues learn them one at a time rather than focusing in on both solutions simultaneously, (b) 2-cue learners take longer to respond than do 1-cue learners, and (c) time allowed to view the stimulus affects both the frequency of multiple-cue learning and the Ss' stated choice of a multiple-look or one-look sampling strategy.—*Journal abstract.*

10891. Danks, Joseph H. & Gans, Dianne L. (Kent State U) **Acquisition and utilization of a rule structure.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Mar), Vol 104(2), 201-208.—In a paired-associate paradigm, stimulus-response pairs were generated from a rule matrix. In Exp I the matrix was shown to different groups of 80 undergraduates either before, during, or after learning, or not at all. Earlier presentation of the rule matrix facilitated acquisition of the stimulus-response pairs. Likewise, presentation of the matrix either before or during learning enhanced generalization to new rule-governed stimuli. But the point of matrix presentation did not affect a test of the already learned pairs. The process of rule learning was analyzed into 3 components: existence, structure, and content of the rule. Knowledge of these components was manipulated by instructions to 44 undergraduates in Exp II. Knowledge of the rule's structure and content, but not of its existence, facilitated learning and generalization to new items.—*Journal abstract.*

10893. Davis, Richard G. (VA Hosp, Tampa, FL) **Acquisition of verbal associations to olfactory stimuli of varying familiarity and to abstract visual stimuli.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Mar), Vol 104(2), 134-142.—Conducted 2 paired-associate (PA) learning studies to observe the acquisition performance of 85 college students with either odors or abstract figures as stimuli and numbers as responses. In both studies visual PA acquisition was

reliably superior to olfactory learning. Since the 2nd study was designed to maximize the learning of associations to the odors and minimize the learning of associations to the figures, it appears that the sense of smell is not as well suited to the PA task as vision when essentially naive Ss are involved. In a 3rd experiment with 60 Ss, the familiarity of odors and figures was judged and reported as a graphic magnitude estimation response. These judged stimulus familiarities were used to select stimuli for the PA task. Subsequently, PA acquisition was facilitated by the use of highly familiar odors. (22 ref)—*Journal abstract.*

10896. Flaherty, John J. & Shapiro, Bernard J. (Rhode Island Junior Coll) **Concept attainment as a function of method of presentation, training, and concept rule.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1087-1091.—3 factors affecting concept attainment—concept rule, preliminary instruction, and presentation paradigm—were considered in an attribute identification study with 80 undergraduates. A  $4 \times 2 \times 2$  factorial design was employed in which the variables were (a) concept rule (conjunction, disjunction, conditional, or biconditional); (b) pretraining (provided or not provided); and (c) presentation paradigm (reception or selection). Reception was clearly superior to selection, while pretraining in truth-table strategy was effective in reducing the difficulty of the conceptual rules. Pretraining also affected the order of difficulty of the rules.—*Journal abstract.*

10897. Galbraith, Gary G. & Galbraith, Sandra A. (Washington State U) **Norms for discrete free associative responses to aurally presented homophones.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 117.

10898. Ghatala, Elizabeth S.; Levin, Joel R. & Makoid, Lois A. (Weber State Coll) **A clarification of frequency effects in children's discrimination learning.** *Memory & Cognition*, 1975(Jan), Vol 3(1), 1-6.—Conducted 3 experiments to assess the effects of certain stimulus variables on children's discrimination learning. A total of 123 4th and 48 6th graders served as Ss. In general, it was found that word frequency was negatively related to discrimination learning as long as the words were meaningful to Ss. Moreover, the relationship between word frequency and performance reversed in free-recall learning, as was expected. Equivalent relationships between frequency and learning were obtained with both verbal and pictorial materials. (23 ref) —*Journal abstract.*

10899. Giambra, Leonard M. (Gerontology Research Ctr, Baltimore City Hospitals, Md) **Labels for response categories: Do neutral labels make conjunctive and inclusive disjunctive concepts equally difficult.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1155-1159.—In a study with a total of 42 undergraduates, 4 groups of 6 or 7 Ss each ( $n = 26$ ) worked 1 problem involving a different concept rule where directional labels for response categories were used. The concept rules were conjunction, alternate denial, inclusive disjunction, and joint denial. 2 additional groups of 8 Ss each worked 1 problem involving a different concept-rule problem with a neutral pair of labels. The concept rules were conjunction-alternate denial, and inclusive disjunction-joint denial. A complete learning task was used. Significant rule effects were found within directional and neutral labels. Conjunction-alternate denial with neutral labels was intermediate in difficulty between conjunction and alternate denial rule with directional labels. The inclusive disjunction-joint rule was intermediate in difficulty between the inclusive disjunction and joint denial rules. The evidence also suggests that the 1st neutral label seen and/or the neutral label of lesser frequency acted strongly to determine the label upon which S focused attention.—*Journal abstract.*

10900. Jackson, Paul & Warr, Peter. (MRC Social & Applied Psychology Unit, U Sheffield, England) **Instances and inferences.** *British Journal of Psychology*, 1974(Nov), Vol 65(4), 547-549.—Studied 20 undergraduates to examine parallels between the combination of particular instances of a cue trait to make a single judgment and the combination of judgments into a compound impression. Predictions derived from a differential weighted averaging model were tested and confirmed, and the implications for theories of impression formation are discussed.—*Journal abstract.*

10902. Kellas, George; McCauley, Charley & McFarland, Carl E. (U Kansas) **Reexamination of externalized rehearsal.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Jan), Vol 104(1), 84-90.—Evaluated the validity of D. Rundus and R. C. Atkinson's (see PA, Vol 44:7692) overt rehearsal technique in a study with 40 undergraduates. To assess any

changes in input processing which might result from overt rehearsal, S-paced item presentation was employed that yielded a measure of study time at successive input positions. This measure monitors S's activity during the stage of processing that might be affected by overt rehearsal and is therefore more appropriate to the problem than a recall performance measure. A covert rehearsal control group was included, which enabled an evaluation of the effects of externalized rehearsal. It was shown that overt rehearsal disrupts the cognitive activities normally utilized on standard memory tasks. In particular, overt rehearsal increased the amount of serial processing and required greater study time relative to covert rehearsal. These results are discussed in terms of a depth-of-processing framework.—*Journal abstract.*

10903. Kuntz, Dolores. (Brescia Coll, London, Ontario, Canada) **Effects of faking instructions on the word-association test.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1183-1192.—Investigated the effects of role-playing instructions on 5 word-association behavioral indices. 90 words varying in associative difficulty and in affective connotation were administered as a word-association test to 72 undergraduates. Ss were randomly assigned to 1 of 3 groups and were tested under standard, "fake good," and "fake bad" instructions. Set significantly influenced mean reaction time, response repetition, forgetting, and "misremembering," but did not interact with affective connotation. This lack of interaction was interpreted as favorable for the use of the word-association technique since no evidence was shown that set distorted the influence of affective connotation. All the set mean effects except that of reaction time reflected the influence of the "fake bad" set. (18 ref)—*Journal abstract.*

10904. Matthews, Leroy J. & Patton, James H. (Idaho State U) **Failure to shift following disconfirmation in concept identification.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Jan), Vol 104(1), 91-94.—Investigated the extent to which Ss reject the disconfirmed hypothesis as a function of prior consecutive successes with it. 93 undergraduates were given either 2, 5, or 8 consecutive confirmations with the relevant hypothesis prior to reversal transfer. It was found that (a) maintaining the disconfirmed hypothesis was related to prior success with it and (b) high-efficiency solvers maintained to a greater extent than low-efficiency solvers. Results are interpreted as supporting a hypothesis that Ss assign a probability to the hypothesis based on a success-failure ratio with it.—*Journal abstract.*

10905. Mueller, John H.; Brown, Sam C. & Kausler, Donald H. (U Missouri) **Paired-associate transfer with homograph stimuli.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Mar), Vol 104(2), 167-172.—Investigated the effect of homograph stimuli in paired-associate transfer paradigms in 2 experiments with a total of 120 undergraduates. Exp 1 involved A-D transfer and compared pairs having responses that cued the alternative meanings on Lists 1 and 2 to pairs having responses that cued the same meaning on both lists; other pairs had homograph stimuli with responses unrelated to meaning, and others had nonhomograph stimuli. The 1st 2 pair types did not differ from each

other, although both differed from the latter 2 types, which also did not differ from each other. Exp II compared homograph stimuli with unrelated responses to nonhomograph stimuli in A-Br transfer, but comparable transfer resulted in each case. Results do not support the encoding variability hypothesis in terms of stimulus recoding in transfer.—*Journal abstract.*

10906. Mueller, John H.; Kausler, Donald H.; Yadrick, Robert M. & Pavur, Edward J. (U Missouri, Columbia) **Encoding strategies in double-function verbal discrimination learning.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Jan), Vol 104(1), 55-59.—Conducted 2 experiments with a total of 128 undergraduates to test various encoding strategies with double-function lists. A double-function verbal discrimination list uses each word as a correct term and an incorrect term in different pairs. Frequency and single-image cues were expected to be of limited utility, whereas other strategies that emphasize the right-wrong association were expected to be helpful. Results show that verbal strategy facilitated learning, but that single images, compound images, and logical combination strategies did not.—*Journal abstract.*

10907. Ohnmacht, Fred W.; Brody, Richard & O'Connor, John. (State U New York, Albany) **Relationship of false recognition and paired-associate learning ability with learning of reversal and nonreversal shift.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1279-1283.—Administered a false-recognition task and a paired-associate learning task to 43 undergraduates. Half the Ss were given a reversal shift and the rest a nonreversal task. The paired-associate task was found to be unrelated to both the reversal and nonreversal tasks, while the false-recognition task was significantly related to the reversal shift but not to the nonreversal task. False recognition was also significantly related to the initial discrimination learned in the reversal shift-nonreversal shift paradigm. A 2-stage recognition model is used to explain the results.—*Journal abstract.*

10908. Ohnmacht, Fred W.; Grippin, Pauline C.; O'Connor, John & Brody, Richard. (State U New York, Albany) **Paired-associate learning, false-recognition scores, and performance in a hierarchically arranged concept-learning task.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1207-1210.—Studied 23 undergraduates to test the hypotheses that (a) paired-associate learning would be negatively related to number of acquisition trials for simple concepts but not related to a complex one and (b) false recognition would be positively related to such acquisitions but most strongly related to a relatively complex one. Data provide some support for these predictions.—*Journal abstract.*

10909. Prokasy, William F.; Clark, Craig G.; Williams, William C. & Spurr, Charles W. (U Utah) **A classically conditioned skeletal response can be acquired with a discriminated punishment contingency.** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 551-553.—Ex-posed 26 undergraduates to a discriminated punishment contingency with the aversive stimulus being an air puff to the cornea. In most Ss there was an increase in response probability (an eyelid reflex) across trials, and an application of the 2-phase model showed that the increases, though not great, were reliable. An analysis of

the estimated parameter values showed that for only 5 of the 26 Ss did the pattern of parameter values conform to what would be expected on the basis of either 2-factor or relative reinforcement theory. Results are, however, consistent with what might have been expected from giving Ss a low ratio intermittent reinforcement schedule in a more traditional classical conditioning arrangement.—*Journal abstract.*

10910. Rollins, Howard A.; Schurman, Don L.; Evans, Mary J. & Knoph, Kathy. (Emory U) **Auditory versus visual processing of three sets of simultaneous digit pairs.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Mar), Vol 104(2), 173-181.—Conducted 2 experiments with a total of 22 undergraduates and graduate students to determine whether the auditory and visual systems process simultaneously presented pairs of alphanumeric information differently. In Exp I different groups of Ss were given extensive practice recalling pairs of superimposed visual or auditory digits in simultaneous order (the order of arrival) or successive order (one member of each digit pair in turn, followed by the other pair member). For auditory input, successive order of recall was more accurate, particularly for the last 2 of 3 pairs presented, whereas for visual input, simultaneous order of recall was more accurate. In Exp II, Ss were cued to recall in one or the other order either immediately before or after stimulus input. Recall order results were the same as for Exp I, and precuing did not facilitate recall in either order for both modalities. Results suggest that processing in the auditory system can only occur successively across time, whereas in the visual system processing can only occur simultaneously in space.—*Journal abstract.*

10911. Schmitt, Neal & Dudyka, Arthur L. (Michigan State U) **Positive and negative cue redundancy in multiple cue probability learning.** *Memory & Cognition*, 1975(Jan), Vol 3(1), 78-84.—In 2 separate experiments, 80 undergraduates completed a 2-cue probability learning task in which cue intercorrelation was positive or negative and cue validities were positive or negative. Results indicate that Ss did not learn the negative validity tasks. In addition, there were no significant differences between groups in achievement due to cue intercorrelation in any one experiment. However, the positive redundancy groups were significantly more consistent in the employment of their decision strategy than the negative redundancy groups when cue validities were positive. The negative redundancy groups were superior to positive redundancy groups in matching; again, when cue validities were positive.—*Journal abstract.*

10912. Siegel, Paul S.; Stenmark, David E.; Rickard, Henry C. & Eastman, Raymond L. (U Alabama) **Vicarious reinforcement or discrete free association?** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Mar), Vol 104(2), 153-159.—Argues that the vicarious reinforcement account of F. H. Kanfer and A. R. Marston (see PA, Vol 37:7599) reduces to an associative control (word linkage) paradigm; no appeal need be made to reinforcement, modeling, imitation, or matching. 36 male undergraduates in Exp I, in the absence of vicarious reinforcement, responded proportionately to model lists that increased, decreased, or held

constant the frequency of critical response words (animal nouns). Exp II, with 36 Ss, included a vicariously reinforced group, a group of controls that received a bell of brief duration following each critical response word verbalized by the model, and a group for which no stimulus change accompanied the model's presentation. The 3 groups failed to separate in the production of critical responses. 67 Ss in Exp III were presented the same critical response words within a discrete free association test. These responses were then compared with those yielded by the Ss of Exp II. All 4 groups yielded about the same number of critical responses. A limited content analysis also revealed striking similarities in the responses of the 4 groups.—*Journal abstract.*

10913. Taplin, John E. (U New South Wales, Kensington, Australia) **Evaluation of hypotheses in concept identification.** *Memory & Cognition*, 1975(Jan), Vol 3(1), 85-96.—Investigated hypothesis evaluation in bidimensional conceptual tasks in 3 experiments with a total of 368 undergraduates. In Exp I, Ss were given an initial hypothesis involving 1 of 8 rules and required to test it to find a concept. When this given hypothesis was true (i.e., the concept), no difference was found between rules for the number of instances selected to the criterion of solution. Moreover, there was a tendency for Ss to choose instances which were predicted to be positive according to the hypothesis under test. Exp II examined the role of memory in hypothesis testing. Immediate recall of instances selected revealed no difference between true and false hypotheses. Both primacy and recency effects were evident in recall. The number of instances correctly recalled was more than expected by models of hypothesis sampling and evaluation, and this was attributed to Ss having a low criterion for recall without intrusions. Differences between rules and positive and negative instances on recall were suggested to be due to different amounts of information processing when classifying each type of instance for each rule; the results of Exp III support this suggestion. (31 ref)—*Journal abstract.*

10915. Underwood, Benton J.; Reichardt, Charles S. & Malmi, Robert A. (Northwestern U) **Sources of facilitation in learning conceptually structured paired-associate lists.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Mar), Vol 104(2), 160-166.—In an experiment with 210 undergraduates, the concepts in a hierarchically structured list consisting of 24 number-word pairs were aligned systematically with position and numbers, or with the number stimuli only. Some lists involved an alignment appropriate only to the lowest conceptual level. Other lists were completely unstructured when viewed in terms of either position or number. The lowest level concepts in the hierarchy were most heavily involved in learning, although the concepts at the higher levels had a small influence. When the hierarchy was aligned with the number series only, the structure was apparent to Ss but their learning was not greatly influenced. Results suggest that conceptual structure facilitates learning most effectively when the

order of the instances of the concepts is held constant.—*Journal abstract.*

10916. Vendrell Brucet, José & Vendrell Gómez, D. Pedro. [Sensory input, information, and communication.] (Span) *Anuario de Psicología*, 1973, No 8, 3-20.—Constructed an experimental language and compared the progress of 2 groups of adults who learned it by visual and by audio methods. Results reveal no significant differences between the groups. It is concluded that learning a natural language is basically independent of the way its signs have been assimilated. (English summary)

10917. Wason, P. C. & Golding, Evelyn. (University Coll London, Psycholinguistics Research Unit, England) **The language of inconsistency.** *British Journal of Psychology*, 1974(Nov), Vol 65(4), 537-546.—Studied 75 undergraduates to examine Ss' inconsistent remarks in explaining their erroneous solutions to a difficult deductive problem. 4 half-masked cards of the following types were presented: (a) a number in the lower half, (b) a blank in the upper half, (c) a letter in the upper half, and (d) a blank in the lower half. Ss were required to determine which cards needed to be unmasked to determine decisively whether a sentence like "A letter is above each number" was true or false. The original aim was to determine the possible effects of varying the order of the terms in the test sentence. Results are inconclusive. However, the Ss' protocols were of interest. When asked to justify their incorrect solutions, their remarks revealed the operation of irreversible thought processes. 3 possible hypotheses about them are considered, and it is argued that one involving dissociation of attention is most plausible. (18 ref)—*Journal abstract.*

10918. Wiegand, Dieter. [Quantitative measurement of psychological stress while driving by means of a simultaneous secondary task.] (Germ) *Zeitschrift für Experimentelle und Angewandte Psychologie*, 1974, Vol 21(4), 679-690.—Investigated driving stress by measuring performance decline in a number reversal task while driving in rural and city traffic. 15 test drivers of military vehicles, 15 civilian drivers, and a control group who did not perform the number rehearsal task while driving served as Ss in the experiment. Results show a significant reduction of channel capacity under driving stress. The experiment demonstrated that the method used is suitable to measure psychological stress under driving conditions with sufficient differentiation. (English & French summaries)—*W. J. Koppitz.*

10919. Williams, Ian D. (U Waterloo, Ontario, Canada) **Practice and augmentation in learning.** *Human Factors*, 1974(Oct), Vol 16(5), 503-507.—A linear-positioning task was learned by 60 right-handed undergraduate volunteers over 1, 3, or 10 practice trials under high feedback (HFB—augmented position cues) or low feedback (LFB—no positional cue augmentation). Ss' abilities to sustain accurate performance without information feedback and to appraise the magnitude and direction of errors were examined during 10 further test trials. Absolute errors were least after 10 practices with HFB, as predicted by closed-loop theory. However, HFB apparently caused performance inferior to LFB when only 1 practice trial was permitted.—*Journal abstract.*

## Attention &amp; Memory

10920. Barrett, Terry R. & Ekstrand, Bruce R. (U Colorado) **Second-order associations and single-list retention.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Jan), Vol 104(1), 41-49.—Conducted 2 experiments with a total of 144 undergraduates to determine whether or not the presence of a rule structure in a paired-associate list would affect forgetting over a 1-wk retention interval. In these experiments, the rules were 2nd-order associations that related stimulus-term categories to response-term categories (e.g., if the stimulus is an instance of the concept "animal," then the response is an instance of the concept "fruit"; a sample pair for this rule might be "dog-apple"). In both experiments there was evidence that Ss learn and utilize these rules, consequently reducing long-term forgetting. The rules did not affect the speed of learning. It is suggested that the rules might operate by increasing the Ss' ability to reconstruct the nature of the list after a long retention interval. Alternatively, 1st-order associations may be less susceptible to extra-experimental interference if they are stored hierarchically under unique higher-order associations.—*Journal abstract.*

10921. Bencomo, Armando A. & Daniel, Terry C. (Dept of Economic Security, Phoenix, AZ) **Recognition latency for pictures and words as a function of encoded-feature similarity.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Mar), Vol 104(2), 119-125.—In separate trials of a same-different recognition task, a single target item presented to 24 undergraduates as either a picture or a word was followed after a 30-sec delay by a single test item, either a picture or a word. Test items were either nominal matches for the target (same) or 1 of 5 related distractor items. Distractors were selected to resemble the target item on 1 of 5 dimensions: orthographic, acoustic, conceptual (functional or categorical), schematic (similar in shape), or neutral. Same-different reaction times varied systematically as a function of depiction mode of target and/or test items and by distractor type. Verbally related distractors (orthographic and acoustic) produced longer reaction times when target or test items or both were presented as printed words. When target or test items were presented as pictures, schematic and conceptual distractors produced the longest rejection latencies.—*Journal abstract.*

10922. Bernbach, Harley A. (Purdue U) **Rate of presentation in free recall: A problem for two-stage memory theories.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Jan), Vol 104(1), 18-22.—Notes that the lack of any effect of rate of presentation at the recency end of the free-recall serial position curve has long been taken as a strong point of evidence for a 2-stage model of memory. The present 3 experiments with a total of 127 undergraduates demonstrate that this finding is (a) not generally reproducible, (b) not consistent with the most common form of the 2-stage theory, and (c) is reproducible under circumstances that have nothing to do with the structure of the memory system. The pattern of findings is taken as posing a serious problem for 2-stage theories of memory.—*Journal abstract.*

10923. Blowers, Geoffrey H. (U Hong Kong) **Field dependence and distraction in a simple psychomotor task with a constant foreperiod.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1239-1244.—Notes that rod-and-frame test errors are thought to reflect differential abilities in selective attention and argues that a study of the relationship of field dependence to distraction should involve Ss whose field-dependence scores have been determined specifically by the rod-and-frame test. The present study involved distraction in a simple reaction-time paradigm using 10 field-dependent and 10 field-independent psychology students. There was no correlation between distraction and field dependence, although it may be that a larger difference in field-dependence scores between groups is required to detect differences in susceptibility to distraction.—*Journal abstract.*

10924. Castaldo, Vincenzo; Krynicki, Victor & Goldstein, Jared. (Albany Medical Coll, Union Coll & U) **Sleep stages and verbal memory.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1023-1030.—Performed 2 experiments in an attempt to relate sleep stages with overnight memory of consonant trigrams and paired-associates. In Exp I a 20-min learning task before sleep did not alter sleep patterns of 14 high school and university students. Further, neither delta sleep nor REM sleep nor their interaction reliably correlated with recall in the morning. In Exp II the effect of pharmacological alteration of the sleep pattern with imipramine hydrochloride was assessed in 8 medical students. Despite a large suppression of REM sleep and concomitant elevation of Stage 2, recall and relearning in the morning were not different from non-drug values. Results indicate that no sleep stage is uniquely favorable or unfavorable to verbal memory. (23 ref)—*Journal abstract.*

10925. Coltheart, Max. (U Reading, England) **Iconic memory: A reply to Professor Holding.** *Memory & Cognition*, 1975(Jan), Vol 3(1), 42-48.—Discusses D. H. Holding's (see PA, Vol 53:Issue 6) article which argued that the partial report superiority normally taken as evidence for the existence of iconic memory might instead be due to cue anticipation or output interference. It is suggested that both of these alternative explanations are inconsistent with the finding that the partial report superiority diminishes rapidly with increasing cue delay. Previous studies are cited which indicate that output interference effects are absent or negligible in tachistoscopic experiments. Consequently, it is concluded that the partial report superiority, and especially its decline with increasing delay, remains strong evidence in favor of the conventional view of iconic memory. Furthermore, if this view were wrong, there would remain no way of giving a satisfactory account of "direct" investigations of visual persistence or integration and interruption effects in backward visual masking. (19 ref)—*Journal abstract.*

10926. Denis, Michel. [Recall of complex film or verbal material by the child: Dispersion and originality of responses as a function of age and material.] (*Fren*) *Enfance*, 1974(Jan-Apr), No 1-2, 131-142.—Children's ability to recall information presented verbally was compared with their recall of information given by film.

Ss were 60 boys in 3 groups of mean ages 6.6, 8.7, and 10.7 yrs. All had IQs within 1 interquartile range and the means were 98, 99, and 100. As age increased, reports of what was seen or heard were longer and included more of the material, but originality decreased. Material presented by film was recalled less completely than that presented verbally, except by the youngest Ss. Data presented by film produced imaginative responses, common to the whole group, with less interindividual variation. Long-term results were better for film presentation than for verbal presentation.—S. S. Marzolf.

10927. Dhanens, Thomas P. & Lundy, Richard M. (Pennsylvania State U) **Hypnotic and waking suggestions and recall.** *International Journal of Clinical & Experimental Hypnosis*, 1975(Jan), Vol 23(1), 68-79.—Selected, from a group of undergraduate volunteers, 61 high susceptible and 57 low susceptible Ss according to scores on the Harvard Group Scale of Hypnotic Susceptibility, Form A. Motivating and regression suggestions were administered to all Ss with and without hypnotic induction in an effort to improve the recall of contextual and nonsense material. Relaxation-only and control groups were included. The only Ss to improve recall over control were high susceptible Ss in the hypnosis-plus-motivation condition when contextual material was used. Data fail to support previous explanations of hypnotic hypermnnesia based on regression and/or relaxation. (German, French, & Spanish summaries) (19 ref)—*Journal abstract*.

10928. Dick, A. O. (U Rochester) **Iconic memory and its relation to perceptual processing and other memory mechanisms.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 575-596.—Reviews research on iconic memory. Specific issues discussed include the duration of the icon, effects of stimulus variables, types of information lost, selection, processing capacity, and scanning. More general issues include the level of encoding in the icon and its relation to short-term memory. It is argued that a number of experiments do not show what they were intended to show because of possible methodological problems. The view is developed that iconic memory is postretinal but uncoded and that it is not influenced directly by strategies or subsequent mechanisms. (149 ref)—*Journal abstract*.

10929. Epstein, Michael L.; Phillips, W. Daniel & Johnson, Shirley J. (Rider Coll) **Recall of related and unrelated word pairs as a function of processing level.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Mar), Vol 104(2), 149-152.—Conducted 2 experiments with 75 high school and 26 college students to study the effects of 3 processing tasks on cued recall of related and unrelated word pairs. Ss were given either incidental-semantic, incidental-nonsemantic (orthographic), or intentional ("try to learn") processing instructions. Incidental-semantic Ss found a similarity or a difference between paired words. Overall recall was highest in the semantic and lowest in the nonsemantic conditions. Related pairs were better recalled than unrelated pairs in all conditions. In the incidental-semantic condition, pair relationship and processing task interacted—finding differences and similarities facilitated recall of related and unrelated pairs, respectively. Similar findings shown on a 24-hr delayed-recall test.

Results are interpreted in terms of a "levels of processing" model of memory.—*Journal abstract*.

10930. Eriksen, Charles W. & Hoffman, James E. (U Illinois) **Selective attention: Noise suppression or signal enhancement?** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 587-589.—Obtained reaction times (RT) of 4 college students to single letter displays when an indicator, designating in which of 4 possible positions the letter would appear, preceded the display by intervals of 0-150 msec. Prior information, even by as little as 50 msec as to the letter's position, resulted in reduction in RT. Controls ruled out the possibility that the effect was attributable to changes in fixation, masking, or facilitating effects of a first signal. Instead, the effect appears to reflect characteristics of a central selective attentional mechanism.—*Journal abstract*.

10931. Eysenck, Michael W. (U London, Birkbeck Coll, England) **Effects of noise, activation level, and response dominance on retrieval from semantic memory.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Mar), Vol 104(2), 143-148.—44 undergraduates low or high in activation, as measured by the Activation-Deactivation Adjective Check List, participated in two semantic memory tasks, one involving speed of recall and the other speed of recognition. While noise was presented on half the trials. There was an interaction between noise and activation under the recall condition only. High activation facilitated recall performance with high dominance items, but had a detrimental effect with low dominance items. The differential effect of arousal on recall and recognition suggests that arousal affected the retrieval component of recall. Findings are interpreted in light of D. E. Broadbent's hypothesis that high arousal enhances the probability of sampling information from dominant sources. (22 ref)—*Journal abstract*.

10932. Fisher, Dennis F.; Jarombek, Jerry J. & Karsh, Robert. (Human Engineering Lab, Aberdeen Proving Ground, MD) **Short-term memory (1958-1973): An annotated bibliography.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 181.

10933. Galbraith, Richard C. (Northwestern U) **On the independence of attributes of memory.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Jan), Vol 104(1), 23-30.—Investigated the degree of independence of memory attributes in determining performance. Results of a demonstration experiment with 160 college students indicate that memory can carry an associative attribute and a frequency attribute simultaneously with little interaction between the two (i.e., these attributes were independent in their influence on performance). The discussion centers on attribute control as a function of perceived task demands, on the distinction between attribute composition and attribute utilization, and on certain problems inherent in the analysis of memory and the corresponding problems in theory construction.—*Journal abstract*.

10934. Garten, Joseph A. & Blick, Kenneth A. (Virginia Commonwealth U) **Retention of word-pairs for experimenter-supplied and subject-originated mnemonics.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1099-1104.—In a study of 120 undergraduates, the effectiveness of descriptive sentences and mediation

mnemonics supplied by E and originated by S was compared with simple repetition. All mnemonic conditions excelled the control condition, and at the shorter retention intervals (2 days and 1 wk), S-originated devices were significantly superior to E-supplied conditions. At the 8-wk interval all mnemonic conditions, except for the mediation E supplied, produced significantly higher retention than the control condition. —*Journal abstract.*

10935. Gruneberg, Michael M.; Monks, Joseph; Sykes, Robert N. & Osborne, David J. (University Coll Swansea, Wales) **Some correlates of rated memorability of sentences.** *British Journal of Psychology*, 1974(Nov), Vol 65(4), 519-527.—Studied 36 undergraduates to examine the effect of instruction to generate memorable as opposed to grammatical sentences from letter strings of varying lengths. Results indicate that the effect of instruction was limited, but where it was effective higher rated memorability was associated with higher rated sentence simplicity and positive affect. Correlations between the characteristics examined in the study and memorability failed to reveal any relationship between rated bizarreness and memorability, but correlations were found between rated memorability and rated imageability, meaningfulness and sentence simplicity, characteristics found by independent research to be related to memorability. Other correlations between characteristics examined in the study are also discussed. —*Journal abstract.*

10936. Guenther, R. Kim & Linton, Marigold. (U Utah) **Mechanisms of temporal coding.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Mar), Vol 104(2), 182-187.—Presented a series of highly salient, complex visual stimuli to 72 undergraduates in an uninterrupted sequence. Afterward, Ss judged which member of a pair of stimuli occurred earlier and estimated temporal location in the inspection series for each. It was found that (a) presentation time for critical items did not affect accuracy of judgments; (b) presentation time for filler items had no differential effect on accuracy; (c) increased number of items produced poorer performance; (d) the framework of a brief auditory story with no intentional connection to the pictures enhanced performance; and (e) judgments were better on an immediate than on a 24-hr delayed test, particularly for pictures near the end of the original series. A verbal story line may provide an effective framework for recalling the temporal order of events that occur concurrently. —*Journal abstract.*

10937. Hanley, Michael J. & Scheirer, C. James. (State U New York, Binghamton) **Proactive inhibition in memory scanning.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Jan), Vol 104(1), 81-83.—Studied release from proactive inhibition using a memory-scanning paradigm. 32 undergraduate Ss were presented with 4 blocks of 3-item lists of letters and numbers alternately, and reaction time was measured as a function of number of prior lists with a given type of material. It was found that reaction time on shift trials was substantially shorter than reaction time for other trials, indicating a rapid buildup of proactive inhibition in the scanning paradigm. —*Journal abstract.*

10938. Hastie, Reid. (Harvard U) **Intralist repetition in free recall: Effects of frequency attribute recall instructions.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Jan), Vol 104(1), 3-12.—Previous research has shown that when some to-be-remembered words occur twice in a list, free recall of words occurring only once in the same list is impaired in relation to recall of words from comparable lists in which all words occur once. In the present research 2 experiments were conducted to specify the conditions that produced the inhibition of recall of once-presented words accompanied by twice-presented words. A total of 114 undergraduates served as Ss. It was found that free recall of once-presented words accompanied by twice-presented words was inhibited only when the S was instructed, before list presentation, to distinguish between once- and twice-presented words during free recall. In contrast to free-recall performance, recognition memory for once-presented words occurring in lists containing twice-presented words was not impaired. (17 ref) —*Journal abstract.*

10939. Hintzman, Douglas L.; Summers, Jeffrey J. & Block, Richard A. (U Oregon) **Spacing judgments as an index of study-phase retrieval.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Jan), Vol 104(1), 31-40.—Investigated the hypothesis that the ability of Ss to judge the distance between 2 presentations of a word in a list reflects study-phase retrieval of the trace of the 1st presentation of the word by its 2nd presentation. 2 experiments were conducted using a total of 153 Ss recruited through a university newspaper. Exp I supported the hypothesis by demonstrating that the accuracy of spacing judgments for associatively related pairs of words, like that for repeated words, was high compared to that for unrelated words. Exp II used spacing judgments to measure retrieval upon repetition of a homograph. In 3 conditions, context words accompanying a homograph on its 2 presentations were either the same, biased the same meaning, or biased different meanings. In all 3 conditions, later spacing judgments were more accurate than in an unrelated-word control. Accuracy did not depend on whether the 2 context words biased the same meaning or different meanings of the homograph. —*Journal abstract.*

10940. Holding, Dennis H. (U Louisville) **Sensory storage reconsidered.** *Memory & Cognition*, 1975(Jan), Vol 3(1), 31-41.—Suggests that models of sensory storage incorporate 3 features: capacity in excess of short-term memory, rapid decay of information and an unprocessed trace as the storage medium. The evidence for each is examined in the visual and the auditory modes. The excess capacity hypothesis is rejected on the grounds that negative results are obtained when output interference and cue anticipation mechanisms are excluded. Rapid decay is seen as a minor effect which may not result from sensory storage. Limited trace storage appears to exist in the form of extremely brief sensory persistence, but applies only to normally attended stimuli; the pivotal concept of subsequent random access to a trace appears unsupported. (78 ref) —*Journal abstract.*

10941. Homa, Donald & Fish, Robert. (New Coll, Div of Natural Sciences) **Recognition reaction time in long-**

term memory as a function of repetition, lag, and identification of positive and negative search sets. *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Jan), Vol 104(1), 71-80.—Investigated, in 2 experiments, the effect of repeated presentations on recognition latency for positive and negative words. In Exp I, using 20 college students, an initial positive list of 20 words was memorized prior to recognition testing; during the testing sequence, positive and negative words were presented 4 times each, with certain words always appearing at predefined lags. In Exp II, with 20 college students unfamiliar with Exp I, a list of 10 negative words was memorized in addition to the 20 positive words. Results indicate that latencies for all stimulus types (positive, unlearned negative, and learned negative) decreased with repeated presentations, whereas the effect of different lags was unimportant. Error rates for unlearned negatives in both experiments were nearly zero; for positive and learned negative items, error rates systematically declined with repeated presentations and were independent of lag size. Results of the 2 experiments are interpreted as providing little support for the recognition model based on familiarity criteria developed in 1974 by R. C. Atkinson and J. F. Juola.—*Journal abstract*.

10942. Johnson-Laird, P. N.; Robins, C. & Velicogna, Lucy. (U Sussex, Lab of Experimental Psychology, Ctr for Research in Perception & Cognition, England) **Memory for words.** *Nature*, 1974(Oct), Vol 251(5477), 704-705.—Tested 2 groups of Ss to determine their recall of sentence meaning and whether a certain element of meaning was conveyed by a noun or a verb. One group was told they would be given a memory test for the theme of a short spoken passage; the 2nd group heard the same passage but was not informed of the memory test. Results indicate that those who knew of the test retained more verbatim information than the group unaware of the memory test. It appears that lexical categories tend to be rapidly forgotten along with the superficial and underlying syntax of the sentence.—*A. de la Haba*.

10943. Jongeward, Robert H.; Woodward, Addison E. & Bjork, Robert A. (U Michigan) **The relative roles of input and output mechanisms in directed forgetting.** *Memory & Cognition*, 1975(Jan), Vol 3(1), 51-57.—Conducted a free recall experiment with 40 undergraduates in which cues to remember all, only 2, or none of the items in each of 8 successive 4-word blocks were presented either before or after a 3-sec rehearsal period. Even though the search set at output was constant (16 to-be-recalled words), there was an "only" effect (i.e., when a 1st set of items (Set A) is followed by a 2nd set (Set B), a post-input cue to recall only Set B produces better recall than does a cue to recall Set B then Set A) for blocks followed by selective (postcue) rehearsal, whereas nonselective (precue) rehearsal produced no such effect. More striking than that result was the ability of Ss, whatever the condition, to differentiate to-be-remembered and to-be-forgotten items. Set differentiation during input appears much more important as a mechanism of directed forgetting than either selective search or selective rehearsal.—*Journal abstract*.

10944. Kolars, Paul A. (U Toronto, Ontario, Canada) **Addendum to "Remembering operations."** *Memory & Cognition*, 1975(Jan), Vol 3(1), 29-30.—Corrects a computational error which modified a result reported in P. A. Kolar's (see PA, Vol 51:10378) study of typographical effects on memory for sentences. Recalculations of the data are described, emphasizing that the main finding, that more is remembered of a sentence than its semantic content, still stands.

10945. Kristofferson, Marianne W. (McMaster U, Hamilton, Ontario, Canada) **On the interaction between memory scanning and response set.** *Memory & Cognition*, 1975(Jan), Vol 3(1), 102-106.—Conducted 2 item recognition studies with a total of 48 undergraduates. Exp I replicated a previous study by H. Egeth et al (see PA, Vol 49:8377) but with a within-S design. Consistent with their findings, analogous differences obtained between mean reaction times (RTs) to positive set sizes of 1 and 3 were significantly greater when Ss pressed 2 different keys to indicate whether a test letter was a member of the positive set (2-response condition) than when Ss pressed a single key to indicate only that a test letter was a positive set member (1-response condition). In Exp II, those item recognition procedures which are known to allow serial exhaustive search to occur were used, and data were collected for 4 positive set sizes. RT was a linear function of set size for both response conditions, the slopes of the functions did not differ significantly, and absolute slope values were consistent with previously reported findings for the 2-response condition and letter stimuli. It is concluded that response requirements sometimes have effects on memory scanning (the slope of the item recognition function).—*Journal abstract*.

10946. Kroll, Neal E.; Kellicut, M. H. & Parks, Theodore E. (U California, Davis) **Rehearsal of visual and auditory stimuli while shadowing.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Mar), Vol 104(2), 215-222.—Presented memory trigrams to 24 undergraduates using 1 of 3 methods: visual-concurrent (all 3 letters appeared simultaneously), visual-successive, and auditory-successive. During the 12-sec retention interval, Ss shadowed and reported their rehearsals and mnemonic associations via switches. On trials without associations, recall performance supported the hypothesis that the form of rehearsal is related to presentation modality. However, the frequency and temporal patterning of the rehearsals over the retention interval were virtually identical for all 3 presentation conditions, suggesting that the "control processes" were relatively independent of both method of presentation and modality of rehearsal. Data suggest that the efficiency of each rehearsal was also independent of those same factors, in each case quite comparable to that of a concurrent visual stimulus. (17 ref)—*Journal abstract*.

10947. LaBerge, David & Brownston, Lee S. (U Minnesota) **Control of visual processing by color cuing.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 417-418.—Conducted a study of 8 adult Ss to determine whether color cuing would improve Ss' performance on target letter recognition tasks. Ss tachistoscopically viewed letter arrays containing 5, 10,

15, 20, or 25 letters inserted into a  $5 \times 5$  matrix. Each array contained 1 target letter, either an *F* or an *H*. The S's task was to identify which target letter was present in each display. Within an array, a subset of the letters was typed in red ink, and the remaining subset in black ink. In the cued condition, S was told the color of the target letter; in the uncued condition this information was withheld. Results indicate that color cuing significantly increased the accuracy of letter detection. Also significant were total display size, color of cue, and, within the cued condition, size of the target-color subset.—*Journal abstract*.

10948. Light, Leah L.; Berger, Dale E. & Bardales, Marlene. (Pitzer Coll) **Trade-off between memory for verbal items and their visual attributes.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Mar), Vol 104(2), 188-193.—In an experiment with 96 high school students, instructions to attend to the case and color in which words were presented led to improved retention of these visual attributes but depressed recognition performance. This trade-off between item and attribute memory occurred at 3 presentation rates (1.5, 5.5, and 10.5 sec/item), suggesting that visual attributes of verbal stimuli are rarely stored unless Ss expect that knowledge of physical form will be useful later. Visual attributes of high-imagery words were retained better than visual attributes of low-imagery words by Ss instructed to attend to case and color, but not by Ss asked only to attend to word meaning. Implications for the hypothesis that visually presented verbal stimuli are stored as literal copies are discussed.—*Journal abstract*.

10949. Loftus, Geoffrey R. & Bell, Susan M. (U Washington) **Two types of information in picture memory.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Mar), Vol 104(2), 103-113.—Conducted 2 experiments to study (a) the extent to which recognition responses to pictures are based on specific detail vs general visual information, (b) whether the amount of specific detail information may be manipulated by varying the complexity of a target picture, and (c) the rate at which the 2 types of information are acquired. A total of 195 undergraduates served as Ss. Results indicate that the rate of encoding specific details varies with the number of potential informative areas in a picture and, given that a detail is encoded, memory performance is not substantially affected by target complexity, exposure time, or presence or absence of a mask. (25 ref)—*Journal abstract*.

10950. Madigan, Stephen. (U Southern California) **Representational storage in picture memory.** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 567-568.—Administered free recall tests to 70 Ss after they had viewed lists of picture and word pairs in various combinations (e.g., picture-picture, word-word, word-picture) using unlabeled slides and auditory labeling procedures. Results show that just as Ss can be highly accurate in identifying the original sense modality of presentation of words, they are also easily able to remember whether items were originally presented in verbal or pictorial form. This finding suggests some representational storage in terms of symbolic as well as sensory modality.—*Journal abstract*.

10951. Manning, Susan K. (Hunter Coll, City U New York) **An effect of context on free recall of categorized words.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 405-407.—Conducted a 3-trial study of 48 undergraduates to examine the effects of context on the learning of specific items in a list. 15 words from 3 categories were embedded in lists containing 15 additional items from the same 3 categories. These additional items were either high- or low-level associates to the category names. Results show that Ss' recall was enhanced on Trials 1 and 2 of experimental words when embedded in the list containing words of low associative level. Results are interpreted as evidence for a contextual dependency view of item learning and a result of the effects of a limited processing capacity.—*Journal abstract*.

10952. Meiselman, Karin C. (Pitzer Coll) **Time taken to switch attention between modalities as a function of mental effort.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1043-1046.—Required 15 paid male college students to perform a reaction-time (RT) task having conditions of certainty and uncertainty. The task was repeated twice with positive and negative reinforcement contingent upon giving faster RTs than in the previous session. RTs were reduced ( $p < .01$ ), and the measure of switching time also decreased ( $p < .05$ ). It is suggested that the effort induced by the reinforcement conditions decreased the time taken to switch attention between modalities (light and tone).—*Journal abstract*.

10953. Mercer, Neil M. (U Leicester, England) **Cues to retrieval from long-term verbal memory.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1234.—Conducted a study with 30 Ss to investigate the effects of different cues on response latency for naming objects. Results support models of long-term memory in which the first letter or phoneme is used in the encoding of words.

10954. Meunier, Gary F.; Millsbaugh, John & Meunier, Jo A. (Ball State U) **Effects of different level processing on retention.** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 562-564.—Examined memorial effects of continued stimulus processing at either a deep or shallow level. 128 undergraduates were divided into 2 groups according to whether they knew about a recall test that followed stimuli presentation; stimuli were 36 words placed in 4 groups based on their meanings. Depth and amount of processing were manipulated within Ss. Recall performance improved with extra processing at both levels, although the extent of this improvement was greater following the deeper analysis. Difficulties in experimentation which are unique to this formulation were also noted.—*Journal abstract*.

10955. Murray, D. J. (Queen's U, Kingston, Ontario, Canada) **Graphemically cued retrieval of words from long-term memory.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Jan), Vol 104(1), 65-70.—Examined the effects and interactions of 3 variables upon retrieval, given a graphemic cue. The variables were vocabulary size, ease or difficulty of the retrieval cue, and word frequency. 32 undergraduates were asked to produce in 2 min as many words as they could in which the 1st, 2nd, 3rd, 4th, or 5th letter was A or B or . . . Z. Results show that the number of words

produced was a power function of the number of words it was estimated they would know in which the 1st, 2nd, 3rd, 4th, or 5th letter was A or B or . . . Z (the vocabulary size). Also, with easy retrieval cues, high-frequency words were produced first, which was not the case for difficult retrieval cues. The relationship between word frequency and vocabulary size was also examined. —*Journal abstract.*

10956. Murray, D. J.; Leung, C. & McVie, D. F. (Queen's U, Kingston, Ontario, Canada) **Vocalization, primary memory and secondary memory.** *British Journal of Psychology*, 1974(Aug), Vol 65(3), 403-413.—Conducted 3 experiments with a total of 184 undergraduates to determine whether vocalization of verbal items at presentation affects primary memory (PM) rather than secondary memory (SM). In Exp I vocalization affected the PM component of free recall but not the SM component. Imagery value on the other hand affected SM but not PM. In Exp II vocalization hindered the retention of stories in comparison with silent reading. The effects of structural importance were about equal for the 2 conditions. In Exp III paired-associate learning was uninfluenced by vocalization; furthermore, vocalization did not interact with meaningfulness or presentation rate in determining learning. It is concluded that the effects of vocalization are confined mainly to primary memory. (36 ref)—*Journal abstract.*

10957. Murray, Frank S. (Randolph-Macon Woman's Coll) **Effects of narrative stories on recall.** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 577-579.—Studied the effects of narrative stories on recall of words using lists of different interitem associative strength after different delayed intervals of recall. 16 lists of 10 nouns were presented to 36 female undergraduates. Each S studied lists of different interitem associative strength. 4 of the 16 lists were narrative report lists and were used only to control narrative Ss following instructions. Control Ss received a study time equal to that of their yoked narrative Ss. Ss were required to recall the lists immediately after learning, at the end of session, and either 7, 14, or 28 days later. Significant differences were obtained between the 2 study groups on a session recall test and on the delayed recall interval tests but not on immediate recall test. Recall was greater from lists of high interitem associative strength than from either zero or low interitem associative strength. —*Journal abstract.*

10958. Nilsson, Lars-Göran. (U Uppsala, Sweden) **Locus of the modality effect in free recall: A reply to Watkins.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Jan), Vol 104(1), 13-17.—Argues against the conclusion of M. J. Watkins (see PA, Vol 49:6078), who assumed word length to be a sensitive variable for investigating the locus of the modality effect in free recall (superior recall of auditorily presented words as opposed to visually presented words). It is pointed out that the possible role of word frequency was overlooked. The present article reports a free-recall experiment in which 2 levels of word length and 2 levels of word frequency were orthogonally combined. Ss were 88 undergraduates. The modality effect was found for common words independently of word length. For rare words, the modality effect was found for short but not

for long words. It is therefore suggested that, in order to discuss the locus of the modality effect in terms of pre- and postcategorical stores, the interaction between word length and word frequency has to be considered. The definitions of these pre- and postcategorical stores are also discussed in the light of other memory data concerning modality effects.—*Journal abstract.*

10959. Pellegrino, James W.; Siegel, Alexander W. & Dhawan, Meena. (U Pittsburgh, Learning Research & Development Ctr) **Short-term retention of pictures and words: Evidence for dual coding systems.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Mar), Vol 104(2), 95-102.—Studied the recall of picture and word triads in 3 experiments that manipulated the type of distraction in a Brown-Peterson short-term retention task. 16 undergraduates served as Ss in each experiment. In all 3 experiments recall of pictures was superior to words under auditory distraction conditions. Visual distraction produced high performance levels with both types of stimuli, whereas combined auditory and visual distraction significantly reduced picture recall without further affecting word recall. Results are interpreted in terms of the dual coding hypothesis and indicate that pictures are encoded into separate visual and acoustic processing systems while words are primarily acoustically encoded. (24 ref)—*Journal abstract.*

10960. Petrich, Judith A. (U Pittsburgh) **Storage and retrieval processes in unlearning.** *Memory & Cognition*, 1975(Jan), Vol 3(1), 63-74.—Presents a revised interference theory interpretation of unlearning based on an explicit storage-retrieval model. The theory holds that the 1st and 2nd lists are stored as separate memory units. Intrusions of 1st-list items during 2nd-list learning are viewed as allowing the opportunity for dual storage of the 1st-list item within both memory units. 3 experiments with a total of 76 undergraduates are reported to test the theory. Results show that in standard retroactive inhibition experiments in which no special cues for list discrimination are provided, the major factor which produces unlearning is S's inability to retrieve the 1st-list memory unit. (21 ref)—*Journal abstract.*

10961. Pisoni, David B. (Indiana U) **Auditory short-term memory and vowel perception.** *Memory & Cognition*, 1975(Jan), Vol 3(1), 7-18.—Reports 3 experiments that examined the role of auditory short-term memory in the discrimination of brief 50-msec vowels and longer 300-msec vowels. A total of 52 undergraduates were Ss. Results show that although vowels may be perceived in a categorical-like mode, differences still exist in perception between stop consonants and steady state vowels. Findings are discussed in relation to auditory and phonetic coding in short-term memory. (25 ref)—*Journal abstract.*

10962. Polzella, Donald J. (U Dayton) **Effects of sleep deprivation on short-term recognition memory.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Mar), Vol 104(2), 194-200.—Used a probe-recognition short-term memory paradigm with 5 21-32 yr old males to study the precise effects of sleep deprivation on human memory. It was found that recognition performance, as measured by the sensitivity parameter  $d'$ , was generally impaired for each S after 24

hrs of sleep deprivation. While  $d'$  decreased exponentially as the number of items intervening between the target and the probe increased, this decay rate was not affected by sleep loss. In addition there was confirmation of a previously observed increase in the positive skewness of reaction times after wakefulness. Data support the hypothesis that sleep deprivation increases the occurrence of lapses, periods of lowered reactive capacity, which prevent the encoding of items in short-term memory.—*Journal abstract.*

10963. Rakover, Sam S. (U Haifa, Israel) **Voluntary forgetting before and after learning has been accomplished.** *Memory & Cognition*, 1975(Jan), Vol 3(1), 24-28.—Measured voluntary forgetting in 2 experiments with a total of 190 undergraduates. In both experiments, lists of randomly mixed syllables and numbers were projected on a screen, and Ss were instructed before projection which part of the lists to remember or to forget. In the 1st experiment, the syllables were cued as items to be forgotten in one group, and to be remembered in the other one. At the end of the projection, Ss were instructed to recall freely only the syllables. For the former group, this was an unexpected test. The same list was projected for different groups: 1, 3, 5, 7, and 14 times, with new randomly mixed items each time. Syllable recall increased with an increase of times of projection of the list in the 2nd group, but not in the 1st one. Recall of syllables in the 1st group was, however, above the chance level. Exp II was designed to find the locus of voluntary forgetting mechanisms. It was found that voluntary forgetting after learning had been achieved was ineffective. Results support the hypothesis that voluntary forgetting processes do not operate in the long-term store and that Ss can block the transmission of to be forgotten items from the short-term store to the long-term store. (17 ref)—*Journal abstract.*

10964. Rowe, Edward J. (Memorial U Newfoundland, St John's, Canada) **Ordered recall of sounds and words in short-term memory.** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 559-561.—Compared ordered recall of 7-item sequences of sounds and words in 2 experiments with a total of 36 undergraduates. Bow-shaped serial position curves were found for both types of sequences, but more errors occurred with sounds at all serial positions. This inferior recall of sounds was independent of whether a verbal (Exp I) or nonverbal (Exp II) response procedure was used. Results confirm the superiority of verbal memory processes in the retention of order information.—*Journal abstract.*

10965. Squire, Larry R. & Slater, Pamela C. (U California, San Diego) **Forgetting in very long-term memory as assessed by an improved questionnaire technique.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Jan), Vol 104(1), 50-54.—Describes a new questionnaire technique that avoids sampling bias and therefore permits memories for events of different time periods to be compared with each other. The technique was used in a study with 29 high school students, 16 college students, and 154 26-71 yr old adults (including Veterans Administration volunteers and patients). Results indicate that forgetting can occur gradually over several years when little opportunity

exists for relearning. Beyond several years, there appears to be little additional forgetting.—*Journal abstract.*

10966. Stelmach, George E. & Kelso, J. A. (U Wisconsin, Motor Behavior Lab, Madison) **Memory trace strength and response biasing in short-term motor memory.** *Memory & Cognition*, 1975(Jan), Vol 3(1), 58-62.—Conducted 2 experiments with a total of 85 undergraduates to create differential memory trace strengths in a response biasing paradigm. After the presentation of the criterion location, an interpolated target was presented which was either  $\pm 40^\circ$  from the criterion. S's task was to attend to both targets and recall each when instructed. The 1st experiment involved strengthening the criterion trace via repetition (0, 5, or 14 repetitions), while the 2nd involved providing additional feedback via visual, auditory, and heightened kinesthetic cues. In the initial experiment, a Repetition  $\times$  Response Biasing interaction revealed that repetition systematically reduced error shifts at recall. The 2nd experiment found that, in the combined feedback and visual conditions, response biasing was reduced. It is suggested that memory trace strength appears to be one determiner of error shifts at recall. (15 ref)—*Journal abstract.*

10967. Stratton, R. Paul; Jacobus, Kenneth A. & Brinley, Bonnie. (U Kentucky) **Age-of-acquisition, imagery, familiarity and meaningfulness norms for 543 words.** *Behavior Research Methods & Instrumentation*, 1975(Jan), Vol 7(1), 1-6.—The age at which words are first learned appears to be more influential in determining the ease of retrieving words from semantic memory than are objective frequency, familiarity, imagery, and meaningfulness. To facilitate research on a wider variety of tasks, a total of 1,083 undergraduate volunteers contributed to norms for 543 words for age-of-acquisition, imagery, familiarity, and meaningfulness. Most of the words form single-solution anagrams. There are 471 6-letter nouns and 72 5-letter words. Also reported are the means, standard deviations, and ranges for each dimension and the intercorrelations between dimensions. Intergroup reliabilities ranged from .847 to .982.—*Journal abstract.*

10968. Thios, Samuel J. (Denison U) **Memory for general and specific sentences.** *Memory & Cognition*, 1975(Jan), Vol 3(1), 75-77.—Investigated memory for sentences which contained either specific or general verbs. It was predicted that specific sentences would be remembered better than general ones because they specify more attributes of the interacting nouns. The relative effectiveness of different types of retrieval cues (subject or object nouns or verbs) was also examined. Data from 60 undergraduates show that memory was better for sentences with specific verbs (e.g., *scratched*) than those with general verbs (e.g., *injured*). When synonymic verbs were included, however, the general-specific difference was not found. For complete sentence recall, subject nouns were better retrieval cues than verbs or object nouns.—*L. Gorsey.*

10969. Till, Robert E.; Diehl, Randy L. & Jenkins, James J. (U Minnesota, Ctr for Research in Human Learning) **Effects of semantic and nonsemantic cued orienting tasks on associative clustering in free recall.** *Memory & Cognition*, 1975(Jan), Vol 3(1), 19-23.—Dur-

ing presentation of a randomized list of nonadjacent associative pairs, 42 undergraduates heard a cue after each word designating the task to be performed. All Ss performed 2 tasks. In the identical condition, Ss performed the same task on both members of an associative pair. In the nonidentical condition, Ss never performed the same task on pair members. Semantic tasks led to greater recall than did nonsemantic tasks. Also, percentage of clustering was greater when the 2nd member of a recalled cluster had been used in a semantic task rather than a nonsemantic one. Identical and nonidentical conditions did not differ in the measure of recall. When the 2 tasks were a combination of 1 semantic and 1 nonsemantic task, the identical condition showed a greater percentage of clustering than the nonidentical condition. However, when the 2 tasks were both semantic, no difference in clustering was obtained.—*Journal abstract.*

10970. Tversky, Barbara & Sherman, Tracy. (Hebrew U, Jerusalem, Israel) **Picture memory improves with longer on time and off time.** *Journal of Experimental Psychology: Human Learning & Memory*, 1975(Mar), Vol 104(2), 114-118.—Administered a picture recognition task to 32 undergraduates using 4 picture durations (on time) of .25, .5, 1, and 2 sec and 2 interstimulus intervals (off time) of 1.5 and 3 sec. 60 slides were used and a 6-min free recall period was given before the recognition test in which the original pictures and distractors appeared on either the right or left side of the screen. Results show that both recognition and recall of pictures improve as picture presentation time increases and as time between pictures increases. Processing of the pictures, rehearsal and/or encoding, continued after the picture had disappeared, just as for verbal material.—*Journal abstract.*

10971. Tversky, Barbara. (Hebrew U, Jerusalem, Israel) **Retrieval of pictorial and verbal stimulus codes.** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 580-582.—An experiment that required same-different comparisons of successive pairs of geometric figures represented pictorially or verbally demonstrated that Ss (8 undergraduates) could, even after 8 sec, recode to or retrieve the alternative code of a stimulus in memory such that it was as effective for judgment reaction times as in the original representation. Thus, where both pictorial and verbal codes were available, either could be accessed as needed for the task. There was no tendency to revert to verbal codes; in fact, comparisons to pictures were faster than comparisons to words.—*Journal abstract.*

10972. Vanderhaeghen, Claude & Bertelson, Paul. (U libre de Bruxelles, Lab de Psychologie expérimentale, Belgium) **The limits of prior entry: Nonsensitivity of temporal order judgments to selective preparation affecting choice reaction time.** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 569-572.—On each trial, a reference tactile stimulus and another stimulus, which was unpredictably either a sound or a light-pulse, were presented with a variable time interval. The Ss (5 students) had to give a fast choice reaction to the uncertain stimulus and also to judge its temporal position relative to the reference stimulus. Manipulation of the relative frequency of occurrence of the uncertain

stimuli affected choice reaction time in the usual way, but produced unsystematic effects on apparent order. It is concluded that selective preparation which influences response latency does not necessarily produce a prior entry effect. (18 ref)—*Journal abstract.*

10973. Vardanyan, L. S. (Abovyana Pedagogical Inst, Yerevan, USSR) **[Retroactive inhibition as a function of the type of similarity between learned materials.]** (Russ) *Voprosy Psikhologii*, 1974(Jul-Aug), No 4, 133-136.—Conducted an experimental study of the effects on retention of materials that are dissimilar, similar in content but not in form, similar in form but not in content, and similar in both content and form.—*L. Zusne.*

10974. Wayman, Ronald & Scott, William C. (Oklahoma State U) **The role of facial areas in facial recognition.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 115-116.

10975. Wells, J. Elisabeth & Kirsner, K. (Massey U, Palmerston North, New Zealand) **Repetition between and within modalities in free recall.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 395-397.—Conducted a repetition study with 34 undergraduates to test the effects of lag and modality changes on free recall. Results show a powerful lag effect over the range of 0-9 items; there were no differences in recall between items repeated in the same or different modality in the 56-item list. It is suggested that either the encoding variability hypothesis is wrong or it applies only to variation in semantic attributes, not to variation in physical attributes such as modality.—*Journal abstract.*

10976. Westman, Alida S. & Delprato, Dennis J. (Eastern Michigan U) **Effect of presentation mode on organization and recall.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 415-416.—Presented 6 instances of each of 6 taxonomic categories, using photos and words, to 48 undergraduates under incidental learning set. Ss were unexpectedly asked to free recall the items either 3 min or 1 wk after seeing them. Results show that items in recall were grouped by taxonomic category. Picture or word presentation was used, at best, only for forming subgroups. However, items presented as photos were recalled better than those presented as words, at least after a 1-wk retention interval.—*Journal abstract.*

### Motivation & Emotion

10977. Arnau Gras, Jaime. (U Barcelona, Spain) **[Motivation and behavior: A review and the bases for a scientific conceptualization of motivation.]** (Span) *Anuario de Psicología*, 1973, No 8, 35-51.—Presents a conceptual review, based on analysis of experimental evidence, of the most important interpretations concerning the phenomenon of motivation. Main outlines for further experimental development in this field are formulated. (English summary) (27 ref)

10978. Hiroto, Donald S. & Seligman, Martin E. (U California, Medical Ctr, Ambulatory Psychiatric Services, San Francisco) **Generality of learned helplessness in man.** *Journal of Personality & Social Psychology*, 1975(Feb), Vol 31(2), 311-327.—Notes that learned helplessness—the interference with instrumental responding following inescapable aversive events—has

been found in animals and man. The present study tested for the generality of the debilitation produced by uncontrollable events across tasks and motivational systems. 4 experiments with a total of 96 college students were simultaneously conducted: (a) pretreatment with inescapable, escapable, or control aversive tone followed by shuttlebox escape testing; (b) pretreatment with insoluble, soluble, or control discrimination problems followed by anagram solution testing; (c) pretreatments with inescapable, escapable, or control aversive tone followed by anagram solution testing; and (d) pretreatments with insoluble, soluble, or control discrimination problems followed by shuttlebox escape testing. Learned helplessness was found with all 4 experiments: Both insolubility and inescapability produced failure to escape and failure to solve anagrams. It is suggested that inescapability and insolubility both engendered expectancies that responding is independent of reinforcement. The generality of this process suggests that learned helplessness may be an induced "trait." (24 ref)—*Journal abstract*.

10979. Kirkland, John. (U London, Inst of Education, England) **A subset of interest: Aesthetic pleasure.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1306. —In a study in which 2 groups of Ss each viewed the same randomly generated polygons twice, an Instructional Order  $\times$  Polygon Complexity interaction reached significance for the Aesthetic Pleasure-to-Interest group but not when instructions were presented in the reverse order. It is suggested aesthetic pleasure may be a subset of interest.

10980. Liebhart, Ernst H. (Ealing Technical Coll, England) **Choice as a value.** *European Journal of Social Psychology*, 1973, Vol 3(4), 485-489. —Tested the hypotheses that choice deprivation results in (a) an increase of favorable evaluation of the opportunity to choose, (b) a tendency to implicitly re-establish freedom, and (c) an arousal of the control component of effectance. In Exp I, 56 male Ss were deprived of a previous opportunity to choose and compared with a control group which had not had that opportunity. In Exp II, 40 Ss engaged in a procedure whereby choice was eliminated after 10 trials and compared with a control group which did not exercise choice. Results show that eliminating an opportunity to choose led Ss to prefer an option which still permitted choice to one which did not. Choice deprivation led to negative affective states corresponding to the control component of effectance. Findings are seen as consistent with the notion of choice value.—M. K. Phifer.

10981. Makarovič, Jan. **[A classification of human needs.]** (Sloe) *Anthropos*, 1972, No 3-4, 27-36. —Presents a new 2-dimensional classification of human needs: along the 1st dimension, needs are classified into the categories of preservation and expansion, and along the 2nd, into the categories of private needs and social or interhuman needs, making a total of 4 categories. This classification is functional, in contrast to traditional genetic classifications involving distinctions between primary and secondary needs. The classification is discussed in the context of traditional European philosophy, including dialectical materialism, and in the

framework of modern theories of alienation. (20 ref)—S. Slak.

10982. Payne, John W. (Carnegie-Mellon U) **Relation of perceived risk to preferences among gambles.** *Journal of Experimental Psychology: Human Perception & Performance*, 1975(Feb), Vol 104(1), 86-94. —Investigated the concept of risk and its role in determining preferences, using pairs of specifically constructed 3-outcome gambles. Ss were 47 undergraduates. The risk dimensions, probabilities of winning and losing, and amounts to be won or lost were different for each gamble in a pair, but the expected values and variances were approximately equal. The probability of losing was most important in determining judged risk. The likelihood that the more risky gamble in a pair would be chosen as the preferred gamble was related to the probability relationship within the gambles in a pair. The relative importance of the probabilities and amounts in preference choices was also contingent on the probability relationships. Amounts were more closely associated with preference choices when the probability of winning was greater than the probability of losing within each gamble, and the probabilities were more closely associated with the choices when the probability of winning was less than the probability of losing. The relevance of these findings to other theories of risk and the evidence for contingent processing of information in risky decision making are discussed.—*Journal abstract*.

10983. Pečjak, Vid. **[New theories of motivation.]** (Sloe) *Anthropos*, 1972, No 3-4, 9-16. —Describes and characterizes traditional and contemporary theories of motivation, from instinctivist, learning, and analytic theories through modern cybernetic approaches, and traces their historical roots. Major shortcomings of each approach are discussed. (35 ref)—S. Slak.

10984. Pittman, Thane S. (Gettysburg Coll, Smoke Psychological Lab) **Attribution of arousal as a mediator in dissonance reduction.** *Journal of Experimental Social Psychology*, 1975(Jan), Vol 11(1), 53-63. —Tested the hypothesis that the attribution of arousal to a source is an important step in the dissonance reduction process in a counterattitudinal advocacy paradigm. Specifically, it was hypothesized that the extent to which arousal is attributed to dissonance-producing inconsistency directly affects the amount of dissonance-reducing behavior. If the amount of arousal attributed to inconsistency increases, attempts to reduce dissonance will increase; if the amount of arousal attributed to inconsistency decreases, attempts to reduce dissonance will decrease. The  $2 \times 2 \times 2$  factorial designed to test these predictions involved manipulations of 2 independent sources of arousal (dissonance and fear of shock) and type of arousal attribution cue (delivered by a confederate of the E). Data from 112 female undergraduates support the hypothesis. (22 ref)—*Journal abstract*.

10985. Redd, William H.; Amen, Donald L.; Meddock, Terry D. & Winston, Andrew S. (U Illinois, Children's Research Ctr) **Children's compliance as a function of type of instructions and payoff for noncompliance.** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 597-599. —Studied the role of reinforcement loss and instruction type (positive and negative) in children's compliance with adult instructions. During daily sessions

32 1st- and 2nd-grade children played a 2-choice discrimination game in which 1 response earned 2 tokens (redeemable for toys) and the other earned either 1 or 0 tokens. On successive trials either one or both responses were available. After S showed a preference for the response that paid higher magnitude reinforcement, the adult entered and gave either positive or negative instructions. After these instructions E left and S played alone. Compliance with either instruction involved S's choosing the lower paying response. Results show that the adult's negative instructions were more effective than positive instructions, regardless of whether compliance meant the child's forfeiting 1 or 2 tokens. Boys were significantly more compliant than girls.—*Journal abstract*.

10986. Welford, A. T. (U Adelaide, SA, Australia) **Stress and performance.** In A. T. Welford (Ed), *Man under stress*. New York, NY: John Wiley & Sons, 1974. 140 p. \$10.95.—Discusses the effects on performance of varying types of stress deriving from imbalance between capacity and the demands of tasks, environmental conditions, and social situations which either overload or underload the individual. A model which ties together 3 existing models in this field (the inverted-U hypothesis, signal detection theory, and the Yerkes-Dodson law) is proposed and discussed in terms of personality differences and the problems of talent conservation and heavy responsibility. (French & German summaries) (27 ref)

10987. Zarcone, V.; de la Pena, A. & Dement, W. C. (Stanford U, Medical School) **Heightened sexual interest and sleep disturbance.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1135-1141.—10 17-24 yr old normal male paid Ss were selectively REM-deprived for 2 nights by awakening them at the onset of REM sleep. In addition, there were baseline and non-REM awakening conditions. Heightened sexual interest was defined by the number of film frames in which Ss fixated on parts of the female figure in photographs. The largest mean difference in sexual interest was found between baseline and REM-deprivation. Both the non-REM awakenings and REM-sleep deprivation enhanced sexual interest. The failure to demonstrate a significant difference between REM-deprivation and non-REM awakenings may be due to the fact that Ss were REM-sleep-deprived in both conditions. It is suggested that REM-sleep loss may lead to increased selective attention and preoccupation with any cues which are usually interesting.—*Journal abstract*.

## NEUROLOGY AND PHYSIOLOGY

10988. Collins, Robert L. (Jackson Lab, Bar Harbor, ME) **When left-handed mice live in right-handed worlds.** *Science*, 1975(Jan), Vol 187(4172), 181-184.—Tested 709 C57BL/6J inbred mice for paw preference in biased and unbiased worlds to learn how lateral sense develops and what influences affect its expression. It was found that in unbiased worlds, half were left-handed, and females were more strongly lateralized. In biased worlds, approximately 10% exhibited lateral preferences inconsistent with the world bias, and males were more strongly lateralized. Influences of world-bias appear to be superimposed

upon an already laterally dichotomized population. Initial left-right sense, it is posited, arises as an outcome of a seemingly random process.—*Journal abstract*.

10989. DeFeudis, F. V. (Indiana U, Inst of Psychiatric Research) **Differences in brain and body weights of mice caused by differential housing.** *Experientia*, 1974, Vol 30(5), 521-522.—For periods of 4-11 wks, 496 male Black mice were exposed to either isolated ( $n = 245$ ) or aggregated ( $n = 251$ ) living conditions. Subsequent results show that the brain weights of the aggregated Ss were slightly smaller than those of isolated Ss. In addition, this small significant difference ( $p < .001$ ) in brain weight was correlated with a much greater difference in total body weight. Thus, the brain weight/body weight ratio was significantly greater for aggregated than for isolated Ss. It is concluded that these ratio differences could be a fundamental variable in explaining the effect of environmental factors on brain chemistry and behavior. (French summary)—*R. S. Albin*.

10990. Dunn, Adrian J. & Bondy, Stephen C. (U Florida, Medical School) **Functional chemistry of the brain.** Flushing, NY: Spectrum, 1974. xiv, 272 p. \$14.95.—Constitutes a concise overview of the present state of brain biochemistry, providing an integrated approach which incorporates a spectrum of information from a variety of disciplines, e.g., biochemistry, anatomy, physiology, neurology, and psychology. The general approach taken is that the brain should ultimately be studied in relation to its output in the form of behavior. (20% p ref)

10991. Gessa, G. L. et al. (U Cagliari, Istituto di Farmacologia, Italy) **Norepinephrine and dopamine concentrations in the cerebral cortex of man, monkeys and other mammals.** *Experientia*, 1974, Vol 30(11), 1295-1296.—Studied brain tissues of 8 male human Ss, Wistar rats, cats, and rhesus monkeys. Findings indicate that most cortical dopamine (DA) is not localized in noradrenergic nerve terminals, but in dopaminergic neurons. DA's primary role in the cortex is that of a neurotransmitter, rather than as a precursor for norepinephrine. (Italian summary)

10992. Gottfries, C. G.; Roos, B. E. & Winblad, B. (U Umea, Sweden) **Determination of 5-hydroxytryptamine, 5-hydroxyindoleacetic acid and homovanillic acid in brain tissue from an autopsy material.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(5), 496-507.—Determined 5-hydroxytryptamine (5-HT), 5-hydroxyindoleacetic acid (5-HIAA), and homovanillic acid (HVA) levels in different parts of the human brain in autopsy material of 20 cases (12 male and 8 female). The highest values of 5-HT and 5-HIAA were found in the brain stem, basal ganglia, and medulla oblongata. In the cortex, the phylogenetic older parts belonging to the limbic structures had higher concentrations of 5-HT and 5-HIAA than the neocortex. There was a positive correlation between the 5-HIAA levels in the different regions of the brain. The same correlation, but weaker, was found for the 5-HT levels. There was no positive correlation between age and the chemical variables. The female group had, at least in some areas of the brain, significantly higher levels of 5-HIAA and HVA than the male group. If patients had suffered final hypoxia there

seemed to be reduced concentrations of 5-HIAA. (34 ref)—*Journal abstract.*

10993. **Hamburg, Beatrix A.** (Stanford U, Medical School, Child Psychiatric Clinic) **The psychobiology of sex differences: An evolutionary perspective.** In R. C. Friedman, R. M. Richart, R. L. Vande Wiele & L. O. Stern (Eds), *Sex differences in behavior*. New York, NY: John Wiley & Sons, 1974. xvi, 495 p.

10994. **Hoffmann, K.-P. & Sherman, Murray.** (Max-Planck-Inst für Psychiatrie, Munich, W. Germany) **Effects of early monocular deprivation on visual input to cat superior colliculus.** *Journal of Neurophysiology*, 1974(Nov), Vol 37(6), 1276-1286.—Investigated the effects of monocular deprivation from the 8th postnatal day on afferentiation to the superior colliculus (SC) through the W-direct retinotectal, Y-direct retinotectal, and Y-indirect pathways. Electrically and visually elicited responses were recorded with 4 M NaCl micropipettes or sharpened tungsten wire electrodes from a total of 419 SC neurons in 6 cats ranging in age from 6 to 12 mo. It was found that the nondeprived eye had grossly normal input to the SC, but a possible slight overdevelopment of the Y-indirect pathway was indicated. Afferentation was normal along the 2 retinotectal pathways in the deprived eye, but afferentation through the Y-indirect pathway was lost. It is suggested that the abnormalities in visual afferentiation to the SC in monocular deprivation cats are located in the binocular segment of the geniculocortical system. (25 ref)—*J. Kelly.*

10995. **Nováková, V.; Flandera, V. & Sandritter, W.** (Czechoslovak Academy of Sciences, Inst of Physiology, Prague) **Aggressive rats: Some properties of learning, memory and of the limbic system.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 729-733.—10 mouse-killing male Wistar rats elaborated an acoustic conditioned reflex more slowly than 10 nonkillers. The re-elaboration of the conditioned reflex after a 3-mo pause was also slower in killer Ss. It was necessary to repeat the connection between the conditioned and unconditioned stimulus the same number of times as during the elaboration of the reflex in nonkillers. When the killer Ss were allowed a free choice between a mouse, an estrous female rat, water, and food after a 24-hr period of hunger and thirst, they first killed the mouse, then their 2nd and 3rd reactions were feeding and drinking. Nonkillers took food and water in the 1st, 2nd, and 3rd place. The total content of ribosomal RNA, measured in individual cells of the limbic system, was different in the 2 groups. Mousekillers had a higher content of RNA in the pyramidal cells of the dorsal hippocampus and neurons of the central amygdaloid nucleus, and a lower content in the neurons of the medial and lateral hypothalamus and in septal neurons. The differences were apparent only in neurons, not in interneurons or glia. (31 ref)—*Journal abstract.*

10996. **Peisakhov, N. M.** (Kazan State U, USSR) **[Some specific features of the middle type on the weakness-strength continuum.]** (Russ) *Voprosy Psikhologii*, 1974(Jul-Aug), No 4, 30-40.—Studied the characteristics of individuals who fall in the middle of the Pavlovian strength-weakness continuum of the nervous system, between the extremes. Several different measures

of the strength of the nervous system were taken on 3,217 Ss. The distribution of the values of these measures did not differ statistically from the theoretically expected normal distribution. Results also suggest that the "strong" type of nervous system is characterized by high sensory thresholds and good ability to withstand the effect of strong or prolonged stimuli. The "weak" type shows low thresholds, high sensitivity and therefore greater susceptibility to nervous fatigue, and inability to sustain performance under prolonged or very strong stimulation. The intermediate type shows highly reliable performance under all kinds of stimulus conditions. While the weakness of the strong type lies in its insensitivity and that of the weak type in its excessive sensitivity, the biologically negative aspect of the intermediate type lies in its lower ability to adapt to changing stimulus situations as compared with the strong and the weak type. 11001. **Bauer, Jay W. & Galambos, Robert.** (U California, San Diego) **Evoked potentials in cat auditory nerve: Suppression by prior tonal stimulation.** *Perception & Psychophysics*, 1975(Jan), Vol 17(1), 43-47.—Action potentials (AP) recorded from the eighth nerve of a female cat to a tone pip (S<sub>i</sub>) were suppression when preceded by a monotic or dichotic conditioning tone (T<sub>c</sub>). The suppression increased when (a) the interval

between Tc and S, was decreased, (b) either the intensity or the duration of Tc was increased, or (c) the difference in frequency between the 2 stimuli was reduced. Thus the nerve action potential amplitude correlates strongly, but inversely, with the loudness enhancement effects seen in man (R. Galambos et al, 1972). Since A. Coats and J. Dickey (see PA, Vol 50:2359) found the human AP can be diminished by a preceding noise without reducing the loudness of a click, the available results suggest that a central mechanism functions to compensate for the reduction in AP amplitude. The dichotic effects could be accounted for by cross-hearing, thereby providing no evidence for a role of the olivocochlear bundle in the effects observed. (21 ref)—*Journal abstract*.

11005. Dickson, John W. & Gerstein, George L. (U Pennsylvania) **Interactions between neurons in auditory cortex of the cat.** *Journal of Neurophysiology*, 1974(Nov), Vol 37(6), 1239-1261.—Studied the patterns of functional connectivity between individual auditory cortex neurons. 3 electrodes were implanted in the auditory cortex in each of 20 paralyzed, locally anesthetized cats. Simultaneous recordings of cortical neuronal responses to repeated noise bursts, frequency scans, and tones of a given frequency were analyzed for functional connectivity by cross-correlation of the spike trains. It was found that shared input neural coordination occurred in about half of the observed neuron pairs. Functional interaction between neurons was rare, and stimulus conditions had little effect on strength of shared input. It is suggested that functional connectivity within the auditory cortex consists of a pattern of shared input to cortical neurons which are in close proximity to each other. (77 ref)—J. Kelly.

11006. Fohlmeister, J. F.; Poppele, R. E. & Purple, R. L. (U Minnesota, Lab of Neurophysiology, Minneapolis) **Repetitive firing: Dynamic behavior of sensory neurons reconciled with a quantitative model.** *Journal of Neurophysiology*, 1974(Nov), Vol 37(6), 1213-1227.—Com-

pared the repetitive-firing behaviors of 2 types of sensory neurons with 2 mathematical models. A sinusoidally varying sensory stimulus was applied to a cat muscle spindle and a sinusoidally varying current was intracellularly applied to a crayfish's slowly adapting stretch receptor. The resulting input-output configurations were computer analyzed and expressed as functions of the modulation frequency. These results were compared with computer simulations of 2 models: a leaky integrator with exponential depolarization and a model with voltage and time dependent variables. The comparisons indicate that to describe the basic mechanisms leading to repetitive neuron firing, the rate constant of the leaky integrator model must be considered a variable. The leaky integrator is considered a valid model to describe the dynamics of pulse modulation. (27 ref)—R. Tomaska.

11010. Getchell, Thomas V. & Getchell, Marilyn L. (Yale U, Medical School) **Signal-detecting mechanisms in the olfactory epithelium: Molecular discrimination.** *Annals of the New York Academy of Sciences*, 1974(Sep), Vol 237, 62-75.—Reviews recent research characterizing discriminatory mechanisms at the molecular and receptor cell levels in the vertebrate olfactory system. 3 mechanisms emerge: (a) the translation into electrical signals of the interaction of odorant molecules with receptor proteins in the olfactory receptor cell membrane; (b) the differential thresholds to a single stimulus of the individual receptors; and (c) the fact that

differences in the details of spike patterns elicited by different stimuli recorded from the same cell probably convey at least a fraction of the information about the identity of these stimuli. (62 ref)—*R. S. Albin.*

11011. Gur, Raquel E.; Gur, Ruben C. & Harris, Lauren J. (Stanford U) **Cerebral activation, as measured by subjects' lateral eye movements, is influenced by experimenter location.** *Neuropsychologia*, 1975(Jan), Vol 13(1), 35-44.—Investigated the direction of eye movements during problem-solving by 32 right-handed and 17 left-handed male undergraduates. When facing the questioner, Ss moved their eyes predominantly in 1 direction, either right or left, regardless of the type of question. Therefore, within any given S, 1 hemisphere seemed to be activated preferentially, regardless of problem type. When the questioner sat behind the same Ss, right-handers moved their eyes leftward when solving spatial problems, rightward for verbal problems. Under these circumstances problem-type took precedence over individual movement preferences. Left-handers' eye movements were haphazard when the experimenter sat behind, hence uncorrelated with the type of problem. This result is consonant with the view that right-handers are better lateralized for hemispheric functioning than are left-handers. (French & German summaries) (29 ref)—*Journal abstract.*

11012. Henry, G. H.; Dreher, B. & Bishop, P. O. (Australian National U, John Curtin School of Medical Research, Canberra, ACT) **Orientation specificity of cells in cat striate cortex.** *Journal of Neurophysiology*, 1974(Nov), Vol 37(6), 1394-1409.—Studied the orientation specificity to extended bars and single light and dark edges of simple, complex, and hypercomplex cells in the cat striate cortex. Responses of single units in the striate cortex to a moving bar of light angled over a range of orientations and projected onto a screen in front of the S were recorded with microelectrodes positioned at the cortical projection of the visual axis. Average response histograms were determined for each test angle. It was found that orientation specificity curves for all 3 types of cells were bell-shaped. For most cells, the shape of the curve was dependent on the length of the stimulus, the curve sharpening with increasing length. The shape of the curve remained the same regardless of the stimulus. It is suggested that components of the receptive field of simple cells provide satisfactory explanations of the cell's orientation specificity characteristics, but that the orientation specificity of complex cells is not accounted for by the organization of their receptive fields. 11013. Hobson, J. Allan; McCarley, Robert W.; Freedman, Robert & Pivik, R. Terry. (Harvard U, Medical School, Lab of Neurophysiology, Boston) **Time course of discharge rate changes by cat pontine brain stem neurons during sleep cycle.** *Journal of Neurophysiology*, 1974(Nov), Vol 37(6), 1297-1309.—Studied discharge rate changes in individual neurons of the gigantocellular tegmental field (FTG) of the cat pontine reticular formation during the period of transition from synchronized to desynchronized sleep. Extracellular recordings of action potentials from individual FTG neurons of unanesthetized, restrained cats were obtained during periods ranging from 2 to 11 successive sleep

cycles. Discharge levels during transitions to desynchronized sleep, as indicated by EEG and electromyogram activity, were compared with baseline neuronal discharge levels. Individual FTG neurons showed increasing discharge rates in the 2 min before onset of desynchronized sleep. Long-term measures of pooled brainstem neuronal activity revealed increasing discharge rates during the 1st half of desynchronized sleep, followed by step-like decreases and a low discharge rate during the 5-min period following desynchronized sleep. Results indicate that brainstem neurons operate as a regulatory system for desynchronized sleep. (19 ref)—*J. Kelly.*

(U Claude Bernard, Lab d'Electrophysiologie, Lyon, France) **Qualitative and quantitative discrimination in the frog olfactory receptors: Analysis from electrophysiological data.** *Annals of the New York Academy of Sciences*, 1974(Sep), Vol 237, 102-114.—Evaluated the single olfactory nerve response and determined the number of olfactory receptors from this. It is concluded that many receptor cells are almost devoid of activity in the absence of excitation by stimuli. Other properties of the receptor cells are also discussed.

11015. Ingram, Diana. (U Western Ontario, London, Canada) **Motor asymmetries in young children.** *Neuropsychologia*, 1975(Jan), Vol 13(1), 95-102.—84 right-handed and 19 left-handed 3-5 yr old children showed strongly established hand preferences when tested on a variety of manual tasks. However, the preferred right hand did not possess universally superior manual skill. Although gesture-like activity during speaking was predominantly right-handed, and the right hand showed superior performance on hand strength and finger tapping tasks, it was the left hand that performed better at hand posture and finger spacing tasks. The observed dissociation between hand preference and the ability to perform hand posturing tasks is discussed. (French & German summaries) (39 ref)—*Journal abstract.*

11016. Ingram, Diana. (U Western Ontario, London, Canada) **Cerebral speech lateralization in young children.** *Neuropsychologia*, 1975(Jan), Vol 13(1), 103-105.—Tests of 3-5 yr old children distinguished a right-ear superiority on a dichotic listening task as early as age 3, suggesting that the left hemisphere is to some extent specialized for speech functions by this age. (French & German summaries)

11017. Kress, Gary. (Regis Coll) **Area-luminance effects and the visual evoked brain response.** *Perception & Psychophysics*, 1975(Jan), Vol 17(1), 37-42.—Psychophysical and electrophysiological studies report that luminance must be systematically increased as stimulus area is decreased if a constant response is to be elicited. The visual evoked brain response (VEBR) was recorded from 3 young adult Ss as a function of 8 stimulus intensities for 5 different areas. Results indicate that (a) the amplitude of the B-C component of the VEBR increased in a linear fashion as a function of increases in log luminance, (b) there was a linear reciprocal relationship between the magnitude of log area and log luminance for targets up to 10°, and (c) substituting total number of receptors in an area for stimulus size resulted in receptor-luminance functions identical to the corre-

- sponding area-luminance function. Results are discussed in terms of neural summation. (18 ref)—*Journal abstract*.
11018. Kubota, Kisou; Iwamoto, Takashige & Suzuki, Hisao. (Kyoto U, Primate Research Inst, Japan) **Visuokinetic activities of primate prefrontal neurons during delayed-response performance.** *Journal of Neurophysiology*, 1974(Nov), Vol 37(6), 1197-1212.—Investigated the role of the dorsolateral prefrontal cortex in the performance of delayed response behaviors in 4 macaque monkeys. 91 units of behavior were correlated to the Ss' 2-choice delayed responses to a 2-lamp visual signal with an orange juice reward triggered by the delayed depression of 1 of 2 levers placed below each lamp. After training, a cylinder was implanted in the S's skull over the dorsolateral frontal cortex and an electromyogram taken of the triceps brachii. 63 of the behavior units were activated when the visual cues were presented and also, in the response phase, the S pressed the pre-indicated lever. These are considered visuokinetic units. Results suggest that the visuokinetic units showing differential rates of discharge when the cue is on the S's left or right side indicate participation in the spatial mnemonic function necessary for correct level selection in the experiment's response phase.—*R. Tomasko*.
11019. Murray, M. J. (Princeton U) **A remark on sensory encoding of two-parameter signals.** *IEEE Transactions on Biomedical Engineering*, 1974(Nov), Vol 21(6), 501-502.—In a sensory system with 2 neurons, a stimulus is coded by means of an ordered pair of firing rates. Ambiguity occurs if 2 distinct signals yield the same ordered pair. However, this sensory system can distinctly code all 2-parameter stimuli, even though the "best value" of 1 parameter is the same for both neurons. Provided these signals are above threshold for both neurons, distinct coding is ensured if the slopes of the threshold (and/or equal rate) curves are different for the different neurons.—*R. S. Kennedy*.
11020. Näätänen, Risto & Gaillard, Anthony W. (U Helsinki, Inst of Psychology, Finland) **The relationships between certain CNV and evoked-potential measures within and between vertex, frontal and temporal derivations.** *Biological Psychology*, 1974, Vol 2(2), 95-112.—Contingent negative variations (CNVs) and evoked potentials were recorded over the vertex, frontal, and temporal area of 3 highly experienced adult Ss in a simple reaction-time task with a constant interstimulus interval of 1 sec. Several amplitude measures of the CNV were taken both from averaged and single CNVs. The main findings are: (a) The intrachannel correlation coefficients between amplitude measures of the CNV taken at different latencies were statistically highly significant but relatively low. (b) The interchannel correlation coefficients between the corresponding amplitude measures of the CNV were generally higher. The interchannel relationship for the shortest latency was the strongest. (c) The peak amplitude of the CNV was reached well before the S<sub>i</sub> moment within each channel; this latency was the longest for the vertex CNV. (d) The differences in the peak amplitude of the CNV seemed to be also associated with its longer growth rather than merely with a sharper rise. (e) There was a good correspondence between the results from the averaged and single CNVs. (f) The interchannel correlation coefficients between the amplitudes of the evoked potentials were high. (27 ref)—*Journal abstract*.
11021. Nunez, Paul L. (U California, EEG Lab, San Diego) **Wave-like properties of the alpha rhythm.** *IEEE Transactions on Biomedical Engineering*, 1974(Nov), Vol 21(6), 473-482.—Considers apparent similarities between brain waves and physical waves. The distribution of power in the alpha rhythm over frequency and spatial wavelength was measured in several Ss by means of spatial-temporal Fourier analyses of scalp surface potentials, using multichannel recordings from electrodes placed along the midline. It was found that the spectrum of midline alpha oscillations peaked for long wavelengths (20 cm). A dispersion relation between frequency and spatial wavelength apparently existed for frequencies near the peak alpha frequency. That is, in all 13 records, frequency components just above the peak alpha frequency had shorter midline wavelengths than low alpha frequency components. The relationship of these results to theoretical descriptions of the EEG and to other experiments is discussed.—*R. S. Kennedy*.
11022. Oatman, Lynn C. (US Army Human Engineering Lab, Aberdeen Proving Ground, MD) **Electrophysiological measures of cross-sensory interaction in the central nervous system.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 183-184.
11023. Oatman, Lynn C. (US Army Human Engineering Lab, Behavioral Research Directorate, Aberdeen Proving Ground, MD) **Effects of appetitive drive on auditory evoked potentials: A replication.** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1092-1099.—Reexamined click-evoked potentials in 6 female cats during periods of increased food deprivation under 3 experimental procedures. The amplitudes of click-evoked potentials recorded from the round window, cochlear nucleus, and auditory cortex remained constant as deprivation time increased from 0 to 24 hr regardless of the experimental procedures used. Increased food-deprivation time had no systematic effect on EEG activity recorded from the auditory cortex under the 3 procedures. It is suggested that since increased food-deprivation time under the experimental procedures did not produce a state of heightened EEG arousal, the lack of effect on auditory evoked potentials is related to the amount of environmental stimulation an animal receives during food deprivation.—*Journal abstract*.
11024. Oswald, Wolf D. & Roth, Erwin. (U Erlangen-Nürnberg, W Germany) **[Relationships between EEG and intelligence variables.]** (Germ) *Psychologische Beiträge*, 1974, Vol 16(1), 1-47.—Reviews research on the relationships between intelligence variables and EEGs. The different and even conflicting results seem to be due to methodological and sampling problems. Problems of measurement, scoring, and sampling are discussed. (French summary) (10 p ref)—*English summary*.
11025. Payne, T. L. (Texas A&M U, Coll of Agriculture) **Pheromone and host odor-stimulated potentials in *Dendroctonus*.** *Experientia*, 1974, Vol 30(5), 509-510.—Conducted electrophysiological investigations of antennal olfactory responsiveness to pheromones and host odors among 2 species of *Dendroctonus* (bark beetles). Recordings were made from both males and

females of the species *D. frontalis* Zimm. and *D. brevicornis* LeC. in response to the aggregation pheromones frontalin, exobrevicornin, and to 2 host tree terpenes. Results were electroantennograms (EAGs) that were typical for these species but on which were superimposed potentials apparently from antennal muscle movement. Increased concentration of any one of these compounds also increased both EAG and muscle potential amplitude. It is suggested that these electrophysiologically recorded responses are related to antennal movement (i.e., both antennal raising and orientation) displayed by these species when stimulated by the pheromones and terpenes. (French summary)—R. S. Albin.

(Monash U, Clayton, Vic, Australia) **Remote monitoring of muscle length and EMG in unrestrained cats. *Electroencephalography & Clinical Neurophysiology*, 1974(Dec), Vol 37(6), 649-653.**—Describes a system for the remote recording of electromyogram (EMG) and muscle length in freely moving cats which uses a small telemeter attached to the animal's head to amplify and transmit the EMG and encoded length-gauge signals. (French summary)

11027. Proenza, Luis M. & Morton, Ralph E. (U Georgia, Vision Research Lab) **Overlapping advance control systems for microelectrode positioning. *Electroencephalography & Clinical Neurophysiology*, 1974 (Dec), Vol 37(6), 659-662.**—Discusses overlapping advance control systems in relation to the problems of resolution, compactness, and speed of response which are now present in varying degrees in commercially available, rolling diaphragm, hydraulic microdrives. Applications to electrode positioning for various systems are examined. (French summary)

11028. Rizzolatti, G.; Camarda, R.; Grupp, L. A. & Pisa, M. (U Parma, Istituto di Fisiologia Umana, Italy) **Inhibitory effect of remote visual stimuli on visual response of cat superior colliculus: Spatial and temporal factors. *Journal of Neurophysiology*, 1974(Nov), Vol 37(6), 1262-1275.**—Studied the influence of visual stimuli, located very far from the excitatory part of the unit receptivity field, on the responses of superior colliculus (SC) neurons to moving visual stimuli. 123 neurons were extracellularly recorded in an unanesthetized curarized cat as a visual stimulus was introduced at the moment in which a collicular unit was triggered by another visual stimulus. In more than 80% of the units tested the introduction of the second stimulus strongly inhibited the unit response to the first. Results indicate that the SC is the place 2 or more simultaneous sensory messages requiring incompatible motor responses interact, and that this interaction is an inhibitory one. (34 ref)—R. Tomasko.

11029. Sakai, Kazuya. (U Lyon, Faculty of Medicine, France) **Phasic electrical activity in the brain associated with eye movement in waking cats. *Brain Research*, 1973, Vol 56, 135-150.**—Eye movement potentials (EMP) recorded from the oculomotor nucleus (nucl. III), the lateral geniculate body (LGB), and the visual cortex were analyzed in 10 chronically implanted adult cats. A nucl. III EMP preceded each eye movement by 10-20 msec, and the EMP was independent of visual or

proprioceptive inputs. Both LGB and cortical EMPs were composed of 3 components. The 1st component is discussed in terms of "lambda waves," while the 2nd and 3rd components are discussed in terms of "corollary discharge" from the mesencephalic and pontine oculomotor centers. (48 ref)—*Journal abstract*.

11030. Siddle, David A. & Smith, David G. (U Southampton, England) **Effects of monotonous stimulation on cortical alertness in fast and slow habituation groups. *Journal of Research in Personality*, 1974(Dec), Vol 8(4), 324-334.**—Investigated cortical alertness in 28 undergraduate volunteers displaying fast and slow habituation of the evoked skin conductance response (SCR). It was predicted that during monotonous stimulation, Ss displaying rapid habituation of the evoked SCR would show a more rapid decline in cortical alertness than Ss displaying slow habituation. Quantified EEG and electrodermal measures of cortical alertness were obtained from fast and slow habituation groups of Ss tested under conditions of either repetitive auditory stimulation or reduced sensory input. Results indicate that 8-13 Hz EEG abundance declined more rapidly in fast than in the slow habituation groups under both conditions of monotonous stimulation. No differences were obtained for the lower EEG frequencies (4-8 and 2-4 Hz) or for tonic electrodermal measures. (18 ref)—*Journal abstract*.

11031. Sohmer, H. & Pratt, H. (Hebrew U, Hadassah Medical School, Jerusalem, Israel) **Electrocochleography during noise-induced temporary threshold shifts. *Audiology*, 1975(Mar-Apr), Vol 14(2), 130-134.**—The responses of the auditory nerve and brain-stem auditory nuclei were recorded nontraumatically in 10 normal-hearing adults by means of electrocochleography before, during, and after exposure to white noise intensities which produced temporary threshold shifts. The largest decrement (amplitude decrease and latency increase) was seen in the response of the auditory nerve. Large inter-S variability was seen in the effects of the noise exposure on response amplitude, latency, and recovery rates. (French summary)—*Journal abstract*.

11036. Caul, William F.; Freeman, Betty J. & Buchanan, Denton C. (Vanderbilt U) **Effects of differential rearing condition on heart rate conditioning and response suppression.** *Developmental Psychobiology*, 1975(Jan), Vol 8(1), 63-68.—Reared a total of 42 male and 42 female Sprague-Dawley rat pups in either an enriched or isolated environment for 60 days following weaning. Neither rearing environment nor sex affected heart-rate conditioning. However, when the conditioned stimulus used during conditioning was subsequently presented in a drinking situation, males reared in isolation showed a greater degree of response suppression than did similarly reared females. Males and females reared in the enriched environment did not differ in degree of response suppression.—*Journal abstract*.

11037. Coles, Michael G. (U Illinois) **Physiological activity and detection: The effects of attentional requirements and the prediction of performance.** *Biological Psychology*, 1974, Vol 2(2), 113-125.—Cardiac and electromyographic measures were taken from 10 paid, male undergraduate Ss while they performed a total of 1,800 detection trials over 15 sessions. Ss indicated their judgment on a 4-point rating scale as to whether a deflection occurred in the beam of an oscilloscope. On deflection trials, the beam always deflected at the same place, 6 sec after a warning tone. Task difficulty was manipulated by using 3 different deflection durations. Cardiac deceleration was related to task difficulty in accordance with J. I. Lacey's (1959, 1963) intake-rejection hypothesis. Averaged electromyographic activity did not show this relationship, although it showed similar within-task trends to heart rate. Heart-rate level predicted both the accuracy and confidence of the Ss' judgments, and may have reflected fluctuations in the Ss' motivational state. There was an inverted-U relationship between performance measures and heart-rate variability, and this relationship showed some of the changes with task difficulty predicted from the Yerkes-Dodson law. (19 ref)—*Journal abstract*.

11039. Doering, Charles H. et al. (Stanford U, Medical School) **Plasma testosterone levels and psychologic measures in men over a 2-month period.** In R. C.

Friedman, R. M. Richart, R. L. Vande Wiele & L. O. Stern (Eds), *Sex differences in behavior*. New York, NY: John Wiley & Sons, 1974. xvi, 495 p.

11040. Elias, Jeffrey W.; Elias, Merrill F. & Schlager, Gunther. (Texas Tech U) **Aggressive social interaction in mice genetically selected for blood pressure extremes.** *Behavioral Biology*, 1975(Feb), Vol 13(2), 155-166.—In 4 experiments mice genetically selected for blood pressure (BP) extremes from an 8-way cross of 8 inbred strains were compared with regard to aggressive social behavior. Aggressor Ss from the high and low BP lines were pitted against Ss from the high and low lines (targets). High BP Ss were less aggressive socially than low BP Ss. The low BP Ss exhibited the highest social aggression scores when pitted against high BP targets. Examination of extreme BP groups chosen from the segregating F<sub>2</sub> generation resulting from crosses of the high and low lines indicated that aggressive social behavior and BP were influenced by the same genes or linked genes. (15 ref)—*Journal abstract*.

11041. Foutz, A. S.; Ternaux, J. P. & Puizillout, J. J. (INSERM, Unité de Recherches Neurobiologiques, Marseille, France) **[Sleep in acute "encéphale isolé" cat: II. Paradoxical stages and sleep-waking cycle: Their triggering by baroreceptive fibre stimulation.]** (Fren) *Electroencephalography & Clinical Neurophysiology*, 1974(Dec), Vol 37(6), 577-588.—Data from "encéphale isolé" preparations of adult cats show that different sleep stages can be triggered almost at will by adequate vago-aortic nerve stimulation. However, these provoked stages are not always linked exactly like spontaneous ones: phasic slow-wave sleep or paradoxical sleep (PS) can be provoked directly with the onset of stimulation; the appearance of a provoked stage of PS from a wakeful state results in a genuine experimental narcolepsy. Moreover, after the PS stage, as in the normal S, a refractory period occurs during which another paradoxical activity cannot be triggered. (31 ref)—*English summary*.

11042. Frankenhauser, Marianne & Lundberg, Ulf. (U Stockholm, Psychological Lab, Sweden) **Immediate and delayed effects of noise on performance and arousal.** *Biological Psychology*, 1974, Vol 2(2), 127-133.—Exposed 14 male university students to intermittent, aperiodic noise of 65-85 db(A) while performing mental arithmetic. Measures of performance, subjective stress, catecholamine excretion, and heart rate obtained during and/or after noise exposure were compared with corresponding data from a noise-free session. Performance was not impaired by noise, but the physiological and subjective measures reflected noise-induced changes in arousal level. The time pattern differed between variables, so that the increase in subjective arousal was most pronounced during noise exposure and that of adrenaline excretion after noise exposure.—*Journal abstract*.

11043. Geisler, C. Daniel; Rhode, William S. & Kennedy, Duncan T. (U Wisconsin, Madison) **Responses to tonal stimuli of single auditory nerve fibers and their relationship to basilar membrane motion in the squirrel monkey.** *Journal of Neurophysiology*, 1974(Nov), Vol 37(6), 1156-1172.—Investigated the relationships between the mechanical and neural behavior of the inner

ear of the squirrel monkey. The cochlear nerves of 31 Ss were surgically exposed. An electronic apparatus was used to generate stimulus tones at variable decibel levels for each frequency chosen, and the responses of the nerve fibers were measured. The differences between the slopes of the neural and basilar curves indicate that basilar membrane displacement is not the only input to a nerve fiber. The neural data taken from any one fiber at difficult frequencies suggest that a fixed relationship exists between a linear transformation of the basilar membrane displacement and the discharge rate of a cochlear neuron. Spatiotemporal sorption patterns.** *Annals of the New York Academy of Sciences*, 1974(Sep), Vol 237, 76-90.—Discusses the possibility of an olfactory discrimination mechanism based upon the different space-time patterns by which the molecules of different chemicals spread across the mucosa. It is concluded that there is adequate demonstration of a chromatographic-like process occurring along the olfactory mucosa. (18 ref)

11051. Naparstek, A.; Romette, J. L.; Kernevez, J. P. & Thomas, D. (Weizmann Inst of Science, Rehovot, Israel) **Memory in enzyme membranes.** *Nature*, 1974(May), Vol 249(5456), 490-491.—Describes research done to demonstrate the existence of hysteretic phenomena, through simple kinetic mechanisms which are shared by most enzymes: autocatalysis by the product and inhibition by excess substrate. Hypotheses are developed to describe the problem of information storage in short term memory, in which phase transitions are thought to require structural changes in macromolecular components or in the membrane permeability of the information storage unit.

11052. Nelson, Arnold E. & Simpson, D. Dwayne. (Texas Christian U, Inst of Behavioral Research) **Alteration of respiration during a reaction-time task.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 184.

11053. Netsell, Ronald & Daniel, Billie. (U Wisconsin, Madison) **Neural and mechanical response time for speech production.** *Journal of Speech & Hearing Research*, 1974(Dec), Vol 17(4), 608-618.—Determined the reaction time of 10 neurologically normal young adults for a speech production task. The response was production of a consonant-vowel-consonant word following the offset of an auditory stimulus tone. Electromyography (EMG) was used to mark the onset of orbicularis oris activity in the response, and the interval between stimulus and EMG onset was designated as neural time. Mechanical response time was measured as the interval between EMG onset and the rise in intraoral air pressure marking the completion of the movement in the response. Group neural times and mechanical response times were approximately 140 and 60 msec, respectively, yielding a 200-msec reaction time. The usefulness of the reaction time paradigm is discussed in relation to studies of sensorimotor control in normal and dysarthric speech. (19 ref)—*Journal abstract.*

11054. Ohman, Arne et al. (U Uppsala, Sweden) **Habituation of the electrodermal orienting reaction to potentially phobic and supposedly neutral stimuli in normal human subjects.** *Biological Psychology*, 1974, Vol 2(2), 85-93.—In Exp 1 2 groups of 20 university psychology students each were given either 16 presentations of snake pictures or 16 presentations of pictures of houses. The pictures differed between Ss, but a certain S saw the same pictures throughout the experiment.

Results show no significant difference between groups in response magnitude but significantly fewer trials to habituation in the group given neutral pictures. Exp II with 48 Ss used a within-S design, with mixed presentation of either a snake and a house picture or a spider and house picture. The responses to phobic stimuli were larger than those to neutral ones, and the latter took significantly fewer trials to habituate. Exp III with 40 Ss used a between-S design where some shocks were given before the experiment, and the S was threatened that some shocks would also be given during the experiment. This procedure potentiated the difference between the stimuli, so that the responses to the phobic pictures were about 4 times as large as those to the neutral stimuli. (17 ref)—*Journal abstract*.

11055. Pare, William P. (VA Hosp, Pavlovian Research Lab, Perry Point, MD) **Feeding environment and the activity-stress ulcer.** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 546-548.—Male Sprague-Dawley rats were housed in standard activity cages and fed 1 hr each day. 18 Ss were fed in their activity cages and 12 Ss in the colony home cages in which they resided before being moved to the activity wheel. The latter operation was designed to eliminate novelty stress inherent in the activity wheel environment which would suppress feeding. However, home cage feeding Ss ate less than controls ( $n = 12$ ) and had as many ulcers as activity Ss fed in the activity wheel. Novelty stress did not contribute significantly to the development of the activity-stress ulcer.—*Journal abstract*.

11056. Persky, Harold. (U Pennsylvania) **Reproductive hormones, moods, and the menstrual cycle.** In R. C. Friedman, R. M. Richart, R. L. Vande Wiele & L. O. Stern (Eds), *Sex differences in behavior*. New York, NY: John Wiley & Sons, 1974. xvi, 495 p.

11057. Plutchik, Robert & Conte, Hope. (Albert Einstein Coll of Medicine, Yeshiva U) **Sex differences in reported psychophysiological reactivity.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1221-1222.—On a self-report questionnaire, 9 out of 18 items presumed to reflect sympathetic or parasympathetic dominance differentiated between males and females.

11058. Provins, K. A.; Glencross, D. J. & Cooper, C. J. (Australian National U, Canberra, ACT) **Thermal stress and arousal.** In A. T. Welford (Ed), *Man under stress*. New York, NY: John Wiley & Sons, 1974. 140 p. \$10.95.—Describes 2 series of experiments with male graduate students on the effect of different body temperatures on 2 measures of EEG arousal level and thermal comfort. Findings suggest that the arousal level as indicated by both the subjective and EEG records is not determined solely by either the body temperature or ambient conditions but is a result of their combined influences. (French & German summaries)

11059. Puizillout, J. J.; Ternaux, J. P.; Foutz, A. S. & Fernandez, G. (INSERM, Unité de Recherches Neurobiologiques, Marseille, France) **[Sleep in acute "encéphale isolé" cat: I. Triggering of ponto-geniculo-occipital waves (PGO) and phasic slow wave sleep role of the raphe nuclei.]** (Fren) *Electroencephalography & Clinical Neurophysiology*, 1974(Dec), Vol 37(6), 561-576.—Reports that "encéphale isolé" cat preparation spontaneously elicits alternations of sleep-wakefulness cycles:

sleep stages observed were the same as those previously described in normal cats—light slow-wave sleep (SSL), deep slow-wave sleep (SOLP), phasic slow-wave sleep (SPOL), and paradoxical sleep (PS). However, occurrence of the PS stage was infrequent because S usually awoke during the SPOL stage which precedes PS in unrestrained normal Ss. Large amplitude waves were recorded from the lateral geniculate bodies; these were easily distinguished by their position in the sleep-wakefulness cycles, their morphology, and their responses to different stimuli. Low voltage stimulation of the central cut end of vago-aortic nerves frequently induced rapid succession of the 1st 2 stages of sleep up to the SPOL stage. Data on the function of tryptaminergic mechanisms in the sleep-wakefulness cycle are also presented. (49 ref)—*English summary*.

11060. Schneider, Robert A. (U Oklahoma, Medical School, Oklahoma City) **Newer insights into the role and modifications of olfaction in man through clinical studies.** *Annals of the New York Academy of Sciences*, 1974(Sep), Vol 237, 217-223.—Describes recent research in olfaction concerned with the modification of this sense by such phenomena as zinc depletion, low estrogen levels, and low adrenal corticosteroid values. Abnormalities of olfactory acuity are discussed. Research concerned with decreased sensitivity of smell (hyposmia), absence of the sense of smell (anosmia), and heightened acuity of the sense of smell (hyperosmia) is reviewed. Adaptation as a unique characteristic of the smell sense is summarized. Genetic determinants of body odor are postulated and the relevant research is discussed. Pheromones, chemicals (odors) emitted by one individual and perceived by a second, act on the hypothalamus of the perceiver causing hormonal effects. In other mammals, this phenomenon relates to sexual behavior and it now seems likely that a similar effect is to be found in man. It is suggested that odors activate hypothalamic-releasing factors which in turn effect release of pituitary hormones that act on the hormonal secretion of gonads and the adrenal cortex. Thus, odors are involved in the reproductive physiology of both human and nonhuman forms. (23 ref)—*R. S. Albin*.

11061. Shapiro, C. M.; Moore, A. T.; Mitchell, D. & Yodaiken, M. L. (U Witwatersrand, Johannesburg, South Africa) **How well does man thermoregulate during sleep?** *Experientia*, 1974, Vol 30(11), 1279-1281.—Tested a 22-yr-old male S. Results indicate that REM sleep and precise thermoregulation are mutually exclusive, with sweating being depressed during active sleep. (German summary)

11062. Siegler, Melody V.; Mpitsos, George J. & Davis, William J. (U California, Thimann Lab, Santa Cruz) **Motor organization and generation of rhythmic feeding output in buccal ganglion of *Pleurobranchaea*.** *Journal of Neurophysiology*, 1974(Nov), Vol 37(6), 1173-1196.—Investigated the role that the buccal ganglion of the marine mollusk plays in generating rhythmic feeding output. The nervous systems of 150 Ss were removed and the motoneuron somata were mapped using both dye injection and intracellular stimulation/recording methods. The motoneurons identified with the mollusk's feeding activity were studied during rhythmic feeding output. The intracellular recording identified 4

mechanisms producing motor bursts: excitatory postsynaptic potentials, inhibitory postsynaptic potentials, burstiness of the motoneurons during sustained depolarization, and postinhibitory rebound of action potentials. Results indicate that extrinsic mechanisms play the principal pattern-generating role in shaping the motor output. (52 ref)—*R. Tomasko.*

11063. Steinberg, Alan B. (Richard Stockton State Coll, Faculty of Natural Sciences & Mathematics) **Individual patterns of excretion of metanephrine and normetanephrine by children.** *Biological Psychology*, 1974, Vol 2(2), 135-149.—Examined the excretion of free and conjugated metanephrine and normetanephrine by 16 9-12 yr old children for possible diurnal variations over a 48-hr period of collection. Behavioral ratings and intelligence test scores were examined for possible correlations with both the level and variability of each S's amine excretion. Excretion rates of the amines, expressed as micrograms of amine per 100 mg creatinine, followed a diurnal pattern, exhibiting a daytime peak and nighttime nadir; the observed periodicity could not be attributed to any overall periodicity in creatinine excretion. Effort on mastery of fine motor skills was negatively correlated with the level of conjugated normetanephrine; physical and verbal aggression, as well as response to such aggression, were positively correlated with both the level and variability of this amine. For conjugated metanephrine, only response to aggression was significantly correlated, though there was correspondence between the coefficients obtained for both conjugated amines.—*Journal abstract.*

11064. Susswein, Abraham J. & Kupfermann, Irving. (New York U, Medical School) **Bulk as a stimulus for satiation in *Aplysia*.** *Behavioral Biology*, 1975(Feb), Vol 13(2), 203-209.—In Exp I 10 *Aplysia californica* mollusks, when prefed a partial meal of nonnutritional bulk, ate significantly less food compared to controls. The total mass of material consumed by Ss fed bulk and then fed to satiation with seaweed was not significantly different from the mass consumed by Ss fed to satiation with seaweed alone. In Exp II Ss were fed daily, alternating weekly periods of feeding Ss 50% diluted food with periods of feeding Ss nutritionally normal meals. The nutritional content of diluted meals was significantly less than the nutritional content of undiluted meals. The mass of material consumed was not significantly different for diluted compared to nondiluted meals. Results indicate that the bulk properties of food play an important role in producing satiation in *Aplysia*.—*Journal abstract.*

11065. Taylor, Leslie R. & Costanzo, Dominic J. (Muskingum Coll) **Social dominance, adrenal weight, and the reticuloendothelial system in rats.** *Behavioral Biology*, 1975(Feb), Vol 13(2), 167-174.—22 weanling male Long-Evans rats were chronically paired and as adults were induced to compete daily for food. 6 pairs which demonstrated stable dominance-subordinate relationships served as experimental Ss, while a comparable group of 6 singly housed Ss served in an isolate control group. Activity of the reticuloendothelial system (RES) was measured, the Ss sacrificed, and their adrenal weights recorded in an effort to determine the relative extent of stress associated with these experimental

conditions. In general the greatest stress response was indicated among the dominant Ss, and the least amount of stress was found among the isolate-reared Ss. The RES measure proved to be particularly sensitive to this effect and discriminated among treatment groups quite as well as the more traditional adrenal weight index. (25 ref)—*Journal abstract.*

11066. Ward, Ingeborg L. (Villanova U) **Sexual behavior differentiation: Prenatal hormonal and environmental control.** In R. C. Friedman, R. M. Richart, R. L. Vande Wiele & L. O. Stern (Eds), *Sex differences in behavior*. New York, NY: John Wiley & Sons, 1974, xvi, 495 p.

11067. Wirz-Justice, Anna. (Psychiatrische Universitätsklinik, Basel, Switzerland) **Possible circadian and seasonal rhythmicity in an in vitro model: Monoamine uptake in rat brain slices.** *Experientia*, 1974, Vol 30(11), 1240-1241.—Investigated a factor possibly causing periods of increased susceptibility characteristic of manic-depressive illness. Alterations in sleep-waking patterns, corticosteroid rhythms, and seasonal increases in depressions are associated with the metabolic rhythmicity of the amines. (German summary)

11068. Woolf, C. J.; Willies, G. H.; Hepburn, H. R. & Rosendorff, C. (U Witwatersrand, Medical School, Johannesburg, South Africa) **Time dependence of a neurochemical correlate of a learning task: A non-disruptive approach to memory consolidation.** *Experientia*, 1974, Vol 30(7), 760-762.—Studied changes in the ratio of uridine to cytidine (u/c) in the carp's brain RNA as a neurochemical correlate of a continuous learning task. The task involved the S relearning to swim upright after the attachment of a float to its ventral surface. After the relearning the brains were removed and assayed using thin layer chromatography. Changes in u/c were measured at 2, 4, 6, 8, 16 and 24 hrs after the relearning. Changes noted at 2 and 8 hrs indicate a measure-variable for a nondisruptive study of memory consolidation. (German summary)—*R. Tomasko.*

### Genetics

11069. Alder, Elizabeth M. (U Edinburgh, Scotland) **Genetic and maternal influences on docility in the Skomer vole, *Clethrionomys glareolus skomerensis*.** *Behavioral Biology*, 1975(Feb), Vol 13(2), 251-255.—Study of the *skomerensis* race of the bank vole, *Clethrionomys glareolus*, showed it to be exceptionally docile when handled, compared with the mainland race, *C. g. britannicus*. Laboratory-reared hybrids were all active in temperament like *britannicus*. Cross-fostering *skomerensis* to *britannicus* produced an active temperament, but the reciprocal cross-fostering had no effect. Results are relevant to the evolution of the 2 races. —*Journal abstract.*

11070. Blizard, David A. & Randt, Clark T. (New York U, Medical School, Milbank Research Lab) **Genotype interaction with undernutrition and external environment in early life.** *Nature*, 1974(Oct), Vol 251(5477), 705-707.—Examined the interaction of genetic background with both early life undernutrition and different environmental conditions. Mice of 2 different genetic strains, the C57BL/6J and the DBA/2J, were raised in normal and undernourished nutritional conditions and

in either enriched, normal, or impoverished environments. It was demonstrated that although early life undernutrition in the C57BL/6J strain had a greater effect than in the DBA/2J strain, the occurrence of interaction of the various conditions emphasizes the relative nature of the dependence of nutritional and environmental influences on genotype. The fact that genetic factors can influence an organism's response to undernutrition suggests a possible explanation of why undernutrition seems to affect some human groups while leaving others apparently unaffected. (18 ref)—*A. de la Haba*.

11071. Fuller, John L. (State U New York, Binghamton) **Independence of inherited susceptibility to spontaneous and primed audiogenic seizures in mice.** *Behavior Genetics*, 1975(Jan), Vol 5(1), 1-8.—Reports an experiment in which the familial distribution of spontaneous and primed audiogenic seizures was found to be independent in 301 Binghamton HET mice. No sex or litter differences were found in seizure incidence on either priming or test trials. It is suggested that spontaneous susceptibility may be attributable to homozygosity for audiogenic seizure proneness. A strong genetic influence on sensitivity to priming is also indicated. (21 ref)—*Journal abstract*.

11072. Groszwald, Douglas E. & Luttges, Marvin W. (U Colorado) **Developmental and genetic variables in mouse startle response habituation.** *Developmental Psychobiology*, 1975(Jan), Vol 8(1), 41-48.—Used a behavioral task insensitive to inherent sensory and motor limitations—a startle response habituation technique—to investigate genetic (strains) and developmental (age) effects on behavior. Ss were a total of 160 HS, DBA/2J, C57BL/6-Hs outbred, house, and feral deer mice. All Ss tested using 2 procedures exhibited evidence for habituation which was dependent on strain, age, and length of the testing process. Exploitation of this simple technique may permit clarification of more complex types of behavior.—*Journal abstract*.

11073. Halperin, S. L.; Rao, D. C. & Morton, N. E. (Tripler Army Medical Ctr, Honolulu, HI) **A twin study of intelligence in Russia.** *Behavior Genetics*, 1975(Jan), Vol 5(1), 83-86.—Briefly presents twin data from prewar Russia which show the same effect of family environment on intelligence as in contemporary America.

11074. Parsons, P. A. (La Trobe U, Bundoora, Vic, Australia) **Phototactic responses along a gradient of light intensities for the sibling species *Drosophila melanogaster* and *Drosophila simulans*.** *Behavior Genetics*, 1975(Jan), Vol 5(1), 17-25.—Measured the phototactic responses of 4 recently collected isofemale strains of *Drosophila melanogaster* and *Drosophila simulans* in a light gradient from 590 to 10 lux. High light intensities were preferred by most flies, but a small proportion of flies preferred the lowest light intensity. Based on the strains tested, *D. simulans* showed greater phototaxis than *D. melanogaster*, and within each species variability was found. The niche breadth of *D. melanogaster* appears likely to be greater than that of *D. simulans* for phototaxis in the light gradient. Results are in general qualitative agreement with earlier results published on dispersal activities from the same populations. (16 ref)—*Journal abstract*.

11075. Sprott, Richard L. & Staats, Joan. (Jackson Lab, Bar Harbor, ME) **Behavioral studies using genetically defined mice: A bibliography.** *Behavior Genetics*, 1975(Jan), Vol 5(1), 27-82.—Presents a bibliography of 1,222 references of studies using specific inbred strains of mice, emphasizing 3 general areas—studies in which a behavioral measure was the primary variable of interest (e.g., activity, aggression, memory, or audiogenic seizures); those studies in which treatment effects on behavior were primarily measured (e.g., age, central nervous system, or pharmacological treatments); and review and theoretical articles.—*L. Gorsey*.

## PSYCHOPHARMACOLOGY AND PHYSIOLOGICAL INTERVENTION

11076. Barnett, S. A.; Cowan, P. E.; Radford, G. G. & Prakash, I. (Australian National U, Canberra, ACT) **Peripheral anosmia and the discrimination of poisoned food by *Rattus rattus* L.** *Behavioral Biology*, 1975(Feb), Vol 13(2), 183-190.—24 black (or roof) rats, of the 1st generation bred in the laboratory, were given a choice between millet seed plus vegetable oil and the same mixture with zinc phosphide added. Dosage was based on an experimentally established lethal dose for zinc phosphide of 40.1 mg/kg. Exposure to the poison led first to a total decline in food consumption, but after 6-8 days there was a strong tendency to avoid the poisoned millet in favor of the harmless mixture (poison shyness). Half the Ss were then made anosmic by treatment of the nasal mucous membrane with a solution of zinc sulfate. This had no effect on the discrimination of the poisoned food. It is concluded that although zinc phosphide, when damp, has a distinctive odor, this type of poison shyness evidently does not depend on the olfactory sense.—*Journal abstract*.

11077. Buckholtz, Neil S. (Medical U South Carolina) **Anticonvulsant effects of 6-methoxy-1,2,3,4-tetrahydro- $\beta$ -carboline on audiogenic and electroconvulsive seizures in mice.** *Pharmacology, Biochemistry & Behavior*, 1975(Jan-Feb), Vol 3(1), 65-68.—Tested 6-methoxy-1,2,3,4-tetrahydro- $\beta$ -carboline (6-MeO-THBC) for its anticonvulsant properties against audiogenic seizures in DBA/2J and primed C57BL/6J mice (i.e., mice given a prior auditory exposure) and against electroconvulsive seizures in DBA/2J mice ( $N = 58$ ). 6-MeO-THBC (100 mg/kg) was found to attenuate both types of behavioral seizures 2 hrs after injection as compared to 58 saline controls. In addition, 6-MeO-THBC increased whole brain serotonin and decreased whole brain 5-hydroxyindoleacetic acid 2 hrs after injection. Results suggest a serotonergic involvement in behavioral seizures. (22 ref)—*Journal abstract*.

11078. Cannon, Dale S.; Baker, Timothy B.; Berman, Robert F. & Atkinson, Carol A. (VA Hosp, Alcohol Rehabilitation Unit, Salt Lake City, UT) **A rapid technique for producing ethanol dependence in the rat.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 831-834.—Demonstrated ethanol dependence in 4 groups of 6 male Long-Evans rats following 2-4 days of intragastric intubation with 8-12 g/kg/day. Withdrawal symptoms included tremulousness, hyperactivity,

and seizures. Nutritional deficiency is shown to be an insufficient explanation of the withdrawal symptoms produced. (19 ref)—*Journal abstract*.

11079. Costall, Brenda & Naylor, Robert J. (U Bradford, Postgraduate School of Studies in Pharmacology, England) **Stereotyped and circling behaviour induced by dopaminergic agonists after lesions of the midbrain raphe nuclei.** *European Journal of Pharmacology*, 1974(Dec), Vol 29(2), 206-222.—Studied the role of 5-hydroxytryptamine in the mediation of stereotyped and circling behavior observed after peripherally administered dopaminergic agonists, apomorphine, dextro- and levoamphetamine, methylphenidate, and piribedil, and intrastriatal dopamine in male Sprague-Dawley CFE rats. Lesions of the medial and/or dorsal raphe nuclei reduced the stereotypic effects of all agents, especially apomorphine. Following asymmetric lesions of the medial raphe nucleus, all agents except piribedil enhanced or induced a contralateral circling behavior in a dose-dependent manner. Apomorphine and dextroamphetamine induced an ipsilateral circling in Ss with substantia nigra lesions. Haloperidol and methiothepin inhibited the circling induced by apomorphine and dextroamphetamine in both substantia nigra- and raphe-lesioned Ss in similar doses to those inhibiting stereotyped behavior. Lesions of the raphe nuclei reduced the stereotypic effectiveness of bilateral intrastriatal dopamine but did not significantly modify the asymmetries induced by unilateral intrastriatal dopamine. It is concluded that the medial and dorsal raphe nuclei play an important role in the development of stereotyped behavior and that the medial nucleus is important for the control of circling. The demonstrated relationship between dopamine and 5-hydroxytryptamine (possibly within the striatum) in the mediation of behavioral states indicative of antiparkinson activity may be relevant to the disease state. (32 ref)—*Journal abstract*.

11080. Creese, Ian & Iversen, Susan D. (Johns Hopkins U, Medical School) **The role of forebrain dopamine systems in amphetamine induced stereotyped behavior in the rat.** *Psychopharmacologia*, 1974, Vol 39(4), 346-357.—The caudate nucleus or the tuberculum olfactorium of 30 male Wistar albino rats was lesioned by bilateral stereotaxic injection of 6-hydroxydopamine. 18 other Ss were sham- or noninjected controls. The degree of dopamine depletion was assessed by a sensitive regional dopamine assay and revealed severe depletions in the lesioned areas. The locomotor response to a low dose of dextroamphetamine was not modified by either lesion. However, the stereotypy response to a high dose of amphetamine was abolished by the caudate lesion. The stereotypy response was not modified by lesion to the tuberculum olfactorium. Neither lesion abolished the stereotypy response to apomorphine. Results therefore demonstrate that amphetamine is an indirect sympathomimetic agent and further emphasize the critical role of the dopaminergic nigrostriatal pathway in amphetamine-induced stereotypy. (32 ref)—*Journal abstract*.

11081. Dai, Soter & Ogle, Clive W. (U Hong Kong, Faculty of Medicine) **Effects of stress and of autonomic blockers on gastric mucosal microcirculation in rats.** *European Journal of Pharmacology*, 1975(Jan), Vol 30(1),

86-92.—Studied changes in gastric mucosal microcirculation in Wistar rats by using the method of intra-aortic injection of India ink, followed by microdissection of the mucosa. Acute stress, induced by restraint and exposure to cold for 2 hr, caused marked and significant vasodilatation in the gastric mucosa. This vasodilatation was prevented by pretreatment with atropine or chlorpromazine, but not by  $\alpha$ - or  $\beta$ -adrenoceptor blocking agents. Phentolamine caused significant vasoconstriction in the gastric mucosa of nonstressed Ss, but when Ss were stressed phentolamine induced a greater vasodilatation than was obtained with stress alone. These observations provide added support for the hypothesis that stress induces vagal overactivity, probably of central origin. The resulting strong contractions of the gastric wall and compression of the intramural vessels are probably responsible for degeneration of the mucosal cells leading to the formation of stress-induced ulcers in the rat. (21 ref)—*Journal abstract*.

11082. Donovan, Peter J.; Burrig, Richard G. & Bentsen, Ellen O. (State U New York, Binghamton) **Presurgical dietary history and the behavior of control and septal lesioned rats.** *Developmental Psychobiology*, 1975(Jan), Vol 8(1), 13-25.—40 male Sprague-Dawley albino rats reared under dietary enrichment or standard diet from 25 days of age underwent septal or control surgery 2 mo later. Enrichment differentially altered septal or control behavior as measured by (a) exploration tests; (b) fluid consumption of water, saccharin, and quinine; and (c) acquisition of an active avoidance task. (22 ref)—*Journal abstract*.

11083. Drucker-Colin, Rene R. (I. Miles de Terapeutica Experimental, Mexico City, Mexico) **Crossed perfusion of a sleep inducing brain tissue substance in conscious cats.** *Brain Research*, 1973, Vol 56, 123-134.—Perfusate extracted from the mesencephalic reticular formation (MRF) of a sleeping donor increased the formation and decreased the latencies of slow wave sleep in recipient cats ( $N = 26$ ). No effect was seen on fast wave sleep. Perfusion with Janus Green showed that diffusion was restricted to a very small area of the MRF. Results are discussed in terms of the possible role of a humoral neurotransmitter in inducing sleep. (21 ref)—*Journal summary*.

11084. Drucker-Colin, R. R.; Jaques, L. B. & Cunningham, T. A. (U Nacional Autónoma de México, Inst de Biología, Mexico City) **Anemia from sleep deprivation with anticoagulants in rats with enhancement by PCPA.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 817-826.—Profound anemia occurred in 5-8 days in male Wistar rats fed the anticoagulants phenylindanedione and dicumarol, when fast-wave sleep (FWS) was prevented by the inverted flower pot technique. No anemia occurred in groups of Ss deprived of FWS or receiving anticoagulants only. Anemia was accelerated by intraperitoneal parachlorophenylalanine (PCPA). Anemia was slight when limited FWS was allowed by use of a larger platform or a continuous feeding period. Red blood cell, hemoglobin, and hematocrit values all fell dramatically. There was little evidence of hemorrhage grossly, such as occurs in anticoagulant-treated rats with stress. Histologic study failed to display bleeding or stress involution of

lymphoid tissue but did show diminished splenic iron depots and diminished haemopoietic activity in the splenic red pulp. Electroencephalography showed, with sleep deprivation, a greater amount of brain waves of the type normally associated with slow-wave sleep. This effect was partially blocked by serotonin depletion through PCPA injections. It is suggested that the development of anemia is due to the combined effects of several mechanisms. Results support the view that FWS-deprivation is not a stress. (20 ref)—*Journal abstract*.

11085. Edwards, M. J.; Lyle, J. G.; Jonson, K. M. & Penny, R. H. (U Sydney, NSW, Australia) **Prenatal retardation of brain growth by hyperthermia and the learning capacity of mature guinea-pigs.** *Developmental Psychobiology*, 1974(Nov), Vol 7(6), 579-584.—Compared the whole- and part-brain weights of guinea pigs used in earlier experiments and related them to the error scores in the serial discrimination reversal task reported in those studied. Mature guinea pigs from mothers heat-stressed on Days 20-24 of gestation had smaller whole- and part-brain weights and made more initial and perseverative errors in the original and reversal tasks on a serial discrimination task than control guinea pigs. Offspring from mothers heated on Days 40-44 had smaller whole-brain, brain-stem, and cerebellar weights and made more perseverative errors on the reversal task than controls. No differences in whole or part-brain weights and learning capacity were found between progeny from mothers heated on Days 56-60 and control Ss.—*Journal abstract*.

11086. Eterović, Vesna A. & Ferchmin, Pedro A. (U Nacional de Cordoba, Facultad de Ciencias Químicas, Argentina) **Interaction of environment and injections on brain weight in rats.** *Developmental Psychobiology*, 1974(Nov), Vol 7(6), 515-517.—Exposed male albino rats to environmental complexity (EC) for 4 days. Results show that experimental Ss had heavier cerebra than controls maintained in an impoverished condition (IC). Such a difference did not occur when the EC-IC pairs were given a subcutaneous injection of distilled water or an intracranial injection of saline on the 3rd day of treatment. It is suggested that injecting animals in psycho-biochemical experiments is a procedure whose effects should be determined in every case.—*Journal abstract*.

11087. Golter, Marianne & Michaelson, I. Arthur. (U Cincinnati, Coll of Medicine) **Growth, behavior, and brain catecholamines in lead-exposed neonatal rats: A reappraisal.** *Science*, 1975(Jan), Vol 187(4174), 359-361.—Daily oral administration of lead to newborn Sprague-Dawley rats had no adverse effect on their body growth, although lead-treated rats were more active than age-matched controls. Endogenous levels of brain dopamine were unchanged, whereas norepinephrine was increased, suggesting a possible relationship between lead exposure during earliest developmental periods, increased motor activity, and brain norepinephrine, and not brain dopamine as previously postulated.

11088. Harrison, S. D.; Bosin, T. R. & Maickel, R. P. (Southern Research Inst, Birmingham, AL) **Physiological disposition of atropine in the rat.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 843-845.—Used a specific assay method to study the

physiological disposition of atropine in a total of 68 male Sprague-Dawley rats killed at various times after intraperitoneal administration of <sup>3</sup>H-atropine. At doses of 1.25-10 mg/kg, the greatest localization was seen in kidney and liver, with tissue-plasma ratios of >10:1. Tissue half-lives over the period .5-4 hrs ranged from 40-46 min in plasma to 97-106 min in adipose tissue.—*Journal abstract*.

11089. Hendley, Edith D. & Welch, Bruce L. (U Vermont, Coll of Medicine) **Electroconvulsive shock: Sustained decrease in norepinephrine uptake affinity in a reserpine model of depression.** *Life Sciences*, 1975(Jan), Vol 16(1), 45-54.—Gave electroconvulsive shock (ECS) once daily for 9 consecutive days to chronically reserpinized male Swiss CD-1 albino mice. Shocked Ss explored more actively than controls in an open field 18-20 hrs after the last ECS, suggesting a reversal of reserpine "depression." The apparent  $K_m$  for the high-affinity active uptake of norepinephrine into crude synaptosome-rich homogenates of Ss' cerebral cortices was higher. This suggests that repeated ECS lowered affinity for norepinephrine uptake. The  $V_{max}$  for norepinephrine uptake was also elevated, suggesting that the number of uptake sites had increased as well. (24 ref)—*Journal abstract*.

11090. Mah, C. J. & Albert, D. J. (U British Columbia, Vancouver, Canada) **Reversal of ECS-induced amnesia by post-ECS injections of amphetamine.** *Pharmacology, Biochemistry & Behavior*, 1975(Jan-Feb), Vol 3(1), 1-5.—Trained black-bodded male water-deprived rats to drink from a water spout within an apparatus on each of 2 days. On the 3rd day, passive avoidance of the spout was induced by giving the S a .3-sec, 5 mA footshock after 1 lick at the spout. A test for retention of the avoidance learning was given 48 hrs following training. Electroconvulsive shock (ECS) administered through cortical electrodes at 15 sec following the footshock impaired retention. The amnesia was attenuated when amphetamine (1 mg/kg) was injected immediately but not at 6 hrs following the ECS. In a 2nd experiment, attenuation of amnesia by amphetamine was not found when the ECS occurred at 4 sec instead of 15 sec following the footshock. Results are interpreted in terms of reactivation by amphetamine of a consolidation process that was interrupted by ECS. (30 ref)—*Journal abstract*.

11091. Martinez-Vargas, Marie C. (Lab for Reproductive Biology, Chapel Hill, NC) **The induction of nest building in the ring dove (*Streptopella risoria*): Hormonal and social factors.** *Behaviour*, 1974, Vol 50(1-2), 123-151.—The effects of sex steroids on the nest building behavior of male ring doves were investigated by means of castration and androgen and estrogen treatments. 21 days after castration males were divided into 3 groups of 11 each and given daily injections of sesame oil (SO), testosterone propionate (TP) or estradiol benzoate (EB) for a period of 23 days. Males were tested for courtship and nesting on days 21-23 of hormone treatment in the presence of a sex steroid treated female. The TP- and EB-treated males but not the SO-treated males exhibited high levels of nest building and nest soliciting. Females tested with SO-treated males were delayed in occupying the nest site and performed less

nest soliciting than females tested with hormone-treated males. The interaction of neural and hormonal factors in regulating reproductive behavior is discussed. (French summary) (52 ref)—S. R. Goldstein.

11092. Maruniak, J. A.; Owen, K.; Bronson, F. H. & Desjardins, Claude. (U Texas, Austin) **Urinary marking in female house mice: Effects of ovarian steroids, sex experience, and type of stimulus.** *Behavioral Biology*, 1975(Feb), Vol 13(2), 211-217.—2 experiments with a total of 117 female CF-1 strain mice compared urination rates in (a) naive and sexually experienced females, (b) diestrous and proestrous females, and (c) ovariectomized and estradiol benzoate-treated ovariectomized females, all when exposed to the presence of a male, an ovariectomized female, or an empty chamber. Females deposited urine at mean rates varying from 25-95 marks/hr depending on the stimulus situation. All females deposited urine at significantly higher rates in the presence of males than in the presence of ovariectomized females or the empty chamber. Sexual experience did not significantly alter the frequency of urination by females. There was no significant difference between the urination responses of proestrous and diestrous females or between ovariectomized females and estradiol benzoate-treated ovariectomized females, indicating that this is an ovarian hormone-independent response. The high rates of urine deposition by females in the presence of males could be elicited using only urine from intact but not castrated males. The data taken as a whole strongly suggest that female mice urine mark (i.e., use urine in a communicatory capacity). (26 ref)—*Journal abstract*.

11093. Massaro, Thomas F.; Levitsky, David A. & Barnes, Richard H. (Cornell U, Div of Nutritional Sciences) **Protein malnutrition in the rat: Its effects on maternal behavior and pup development.** *Developmental Psychobiology*, 1974(Nov), Vol 7(6), 551-561.—Used repeated time-lapse photographic observations to examine the maternal behavior and pup development of 8 female Holtzman rats maintained on either a low-protein (12% casein by weight) or a high-protein (25% casein) diet throughout the period of lactation. Dams fed the low-protein diet were observed to spend more time in the nesting area with their pups than dams fed the high-protein diet. Locomotor activity of the dams did not differ between the 2 groups. The behavioral development of the pups suckling the dams receiving the low-protein diet was markedly depressed compared with the controls. Results indicate that feeding a low-protein diet to a lactating dam results in behavioral changes in both the dam and pups that tend to minimize the exposure of the pups to the immediate environment. (20 ref)—*Journal abstract*.

11094. Mueller, R. A.; Millward, D. K. & Woods, J. W. (U North Carolina, Medical School, Chapel Hill) **Circulating catecholamines, plasma renin and dopamine-beta-hydroxylase activity with postural stress.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 757-761.—Studied changes in plasma renin activity, catecholamines, and dopamine-beta-hydroxylase (DBH) activity as a result of head-up tilt and low salt diet in 8 healthy, normotensive, 21-25 yr old male volunteers. Salt restriction and head-up tilt increased plasma renin activity, and these responses appeared to

summate. Head-up tilt increased plasma norepinephrine and epinephrine, but sodium restriction was without effect. Neither stimulus produced significant alterations in plasma DBH catalytic activity. No correlation between DBH activity and either circulating catecholamine was observed. Results indicate that plasma DBH catalytic activity is not a good indicator of acute relatively mild changes in sympathetic activity in humans. (23 ref)—*Journal abstract*.

11095. Popov, Pavel; Dimitrov, Yordan; Georgiev, Stanko & Iliev, Lyubomir S. ("K. Malkov" Agricultural Experimental Station, Plovdiv, Bulgaria) **Indigenous and foreign poppy varieties characterized by the morphine content of their dry capsules.** *Bulletin on Narcotics*, 1973(Jul-Sep), Vol 25(3), 51-56.—Suggests that hybrid combinations of various poppy plants may develop a new strain of plants with the highest morphine yield thus far obtained.

11096. Radcliffe, G. J. & Shelton, J. W. (Baylor Coll of Medicine, Houston, TX) **Molecular coding of maze learning: Demonstration by bioassay.** *Experientia*, 1974, Vol 30(11), 1284-1286.—Used the behavioral bioassay to investigate the molecular coding of maze learning in Swiss albino male mice. 3 experiments were conducted involving training Ss to run a maze, freezing and homogenizing their brains, and injecting the solution into untrained Ss. In all tests, the recipient Ss ran the maze faster than the untrained control group. The active material in the brain was shown to be inactivated by trypsin or chymotrypsin, indicating it is probably a peptide. Results indicate that the active material contained in the extracts of brain taken from maze-trained mice may encode a considerable amount of specific information. (French summary)—R. Tomasko.

11097. Roberts, Warren W. & Martin, James R. (U Minnesota, Minneapolis) **Peripheral thermoreceptor control of thermoregulatory responses of the rat.** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1109-1118.—Describes a study of 60 Long-Evans male rats in which a warm cage floor or localized heaters in the subcutaneous fascia, nasal cavity, pharynx, esophagus, or abdominal cavity consistently elicited the grooming, locomotion, and tail vasodilation components of the S's heat-loss repertoire, but never the prone body extension component. All thresholds were below the cutaneous pain escape threshold, and most were below normal local temperatures during heat stress. Spatial summation was marked. It is concluded that peripheral thermoreceptors do not produce a general "heat drive," but preferentially activate grooming, locomotion, and vasodilation, leaving body extension dependent on central thermoreceptors. Thus, the relative proportions of extension and other responses are adjusted to the distribution of hyperthermia in the body, varying with the acuteness or chronicity, and the exogenous or endogenous origin, of the heat. (20 ref)—*Journal abstract*.

11098. Rommelspacher, Hans & Kuhar, Michael J. (Johns Hopkins U, Medical School) **Effects of dopaminergic drugs and acute medial forebrain bundle lesions on striatal acetylcholine levels.** *Life Sciences*, 1975(Jan), Vol 16(1), 65-70.—Experimental results suggest that the action of chlorpromazine, haloperidol, pimozide, and

apomorphine on the cholinergic system in the striatum of rats is primarily due to the drugs' action at dopamine receptors rather than a direct action on cholinergic receptors which would be due to their anticholinergic activity. (22 ref)

11099. Schwartzbaum, J. S. & Kreinick, Carol J. (U Rochester) **Electrophysiological and behavioral reactivity to photic stimuli following septal lesions and pharmacological treatments in rats.** *Journal of Comparative & Physiological Psychology*, 1975(Jan), Vol 88(1), 128-146.—Conducted 4 experiments, with a total of 86 male Holtzman albino rats, which investigated behavioral reactivity and cortical visual evoked response (VER) to photic stimulation. Analysis revealed 2 patterns of lesion-induced changes. One pattern of VERs reflected a hypoarousal electrophysiological condition. This pattern, present initially under all conditions, could be simulated with administration of scopolamine. A 2nd pattern of VERs developed gradually and appeared to reflect a hyperarousal electrophysiological condition. This pattern could be simulated with dextroamphetamine. While both lesion-induced electrophysiological patterns were associated with augmented behavioral reactivity to flashes, the hyperarousal pattern related to more intense conditions of stimulation and more sustained behavioral reactivity. Scopolamine, as opposed to dextroamphetamine, reproduced the heightened behavioral reactivity to the flashes. Results are interpreted in terms of a hypoarousal hypothesis of sensory hyperreactivity. (42 ref)—*Journal abstract*.

11100. Schwille, P. O.; Schellerer, W.; Reitzenstein, M. & Hermanek, P. (U Erlangen-Nürnberg, W Germany) **Hyperglucagonemia, hypocalcemia and diminished gastric blood flow: Evidence for an etiological role in stress ulcer of rat.** *Experientia*, 1974, Vol 30(7), 824-826.—Studied the effect of pancreatic glucagon (pGI) on the formation of mucosal lesions and ulcers in male SPF Wistar rats. Ss were divided into groups of intact, sham-operated, and adrenalectomized animals. Half of each were stressed by the restraint technique. Local oxygen pressure was measured by polarography and pGI by radioimmunoassay. Results indicate that stress induced mucosal lesions and that the pGI level in stressed Ss is elevated. The highest pGI occurs in adrenalectomized Ss during stress. (German summary)—*R. Tomasko*.

11101. Snyder, James J. & Levitt, Robert A. (Southern Illinois U, Carbondale) **Neural activity changes correlated with central anticholinergic blockade of cholinergically-induced drinking.** *Pharmacology, Biochemistry & Behavior*, 1975(Jan-Feb), Vol 3(1), 75-79.—In 54 male Long-Evans rats, microinjections of carbachol into the septal area elicited water ingestion and increased multiple unit activity at this site and also the noninjected lateral hypothalamus. Carbachol injection into the lateral hypothalamus also elicited water ingestion, but multiple unit activity did not increase in this structure, although it did in the noninjected septal area. If carbachol was injected into one of these sites and isotonic saline into the other, increased multiple unit activity was still found. However, if carbachol was injected into one of these sites and atropine into the other, the increases in multiple unit activity were blocked. Carbachol-elicited drinking may result from

neural activity changes similar to those recorded in this study, and atropine may inhibit carbachol-elicited drinking by inhibiting such neural firing changes. (20 ref)—*Journal abstract*.

11102. Stinus, Louis; Thierry, Anne-Marie & Cardo, Bernard. (U Bordeaux, Talence, France) **Self-stimulation and local injections of 6-hydroxydopamine into the rat brain: Enhanced behavioral depressive effects of  $\alpha$ -methylparatyrosine.** *Pharmacology, Biochemistry & Behavior*, 1975(Jan-Feb), Vol 3(1), 19-23.—Studied the effects of intracerebral injection of 6-hydroxydopamine (6-OHDA) on self-stimulation in 29 male Sprague-Dawley rats. Small amounts of 6-OHDA were injected either in the area ventralis tegmenti (AVT) or laterally in the pedunculus cerebellaris superior (PCS); then all Ss were implanted in the AVT. In spite of marked depletion of brain catecholamines, self-stimulation learning was not altered by PCS 6-OHDA injections, whereas, AVT 6-OHDA injections produced a small perturbation. The administration of low doses of AMPT which had no observable effect in control Ss, produced a severe depression of self-stimulation rates in 6-OHDA pretreated Ss. The depressive effect of AMPT is always more important in rats injected with 6-OHDA in the AVT than those injected at the level of PCS. The respective role of noradrenergic and dopaminergic neurons in AVT self-stimulation are discussed. (42 ref)—*Journal abstract*.

11103. Stone, T. W. (U Aberdeen, Marischal Coll, Scotland) **On the antagonism of ergot alkaloids and dopamine by phenothiazines.** *Experientia*, 1974, Vol 30(7), 827-829.—Discusses the mechanism responsible for the antagonism of LSD by the phenothiazines. Molecular models were constructed of both D-LSD and several phenothiazine derivatives. The models indicate the overlap area of the 2 types of molecules to cause antagonism by enabling each to act at the same receptor site. Implications are drawn for the potential identification of the primary cause of psychotic disorders by the investigation of the dopamine antagonist's molecular site of action. (French summary)—*R. Tomasko*.

11104. Szilávk, László & Tóth, Sándor. (Eötvös Lóránd U, Budapest, Hungary) **New headholder for sensory stimulation and stereotaxic operations in small animals.** *Physiology & Behavior*, 1974(Dec), Vol 13(6), 849-853.

11105. Vrbanc, J. J.; Tilson, H. A.; Moore, K. E. & Rech, R. H. (Michigan State U) **Comparison of 2,5-dimethoxy-4-methylamphetamine (DOM) and d-amphetamine for in vivo efflux of catecholamines from rat brain.** *Pharmacology, Biochemistry & Behavior*, 1975(Jan-Feb), Vol 3(1), 57-64.—Compared the neurochemical effects of DOM and dextroamphetamine under several conditions in unanesthetized male albino Sprague-Dawley rats implanted with chronic-indwelling push-pull cannulae in a cerebral lateral ventricle. Brain catecholamine storage sites were previously pulse-labeled with  $^3$ C-norepinephrine administered intraventricularly. During the perfusion of the lateral ventricles with artificial cerebrospinal fluid, Ss were injected intraperitoneally with 1.5 mg/kg of DOM, 2.0 mg/kg of dextroamphetamine, or 1.0 ml/kg of isotonic saline. Results suggest DOM and dextroamphetamine share qualitatively similar effects in releasing and/or blocking the

reuptake of catecholamines at brain periventricular nerve terminals. Nevertheless, DOM appears to differ from dextroamphetamine in the temporal pattern of net catecholamine release. (25 ref)—*Journal abstract*.

11106. Zaborik, Donna M.; Maier, Steven F. & Pies, Ronald W. (Cornell U) **Preferences for tastes paired with recovery from thiamine deficiency in rats: Appetitive conditioning or learned safety?** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1083-1091.—Conducted a study of 80 male Sprague-Dawley rats to investigate earlier findings that rats develop learned preferences for flavors paired with recovery from vitamin deficiencies. Results show that thiamine deficient Ss preferred flavors paired with recovery from deficiency to other familiar flavors, suggesting that part of the preference for flavors paired with recovery was the result of appetitive conditioning. Data are discussed in relation to "learned safety," specific hungers, illness-induced neophobia, and other phenomena in the taste-aversion literature. (16 ref)—*Journal abstract*.

### Brain & Electrical Stimulation & Lesions

11107. Aghajanian, George K. & Davis, Michael. (Yale U, Medical School) **A method of direct chemical brain stimulation in behavioral studies using microiontophoresis.** *Pharmacology, Biochemistry & Behavior*, 1975(Jan-Feb), Vol 3(1), 127-131.—Describes a method of microiontophoresis for direct chemical brain stimulation in chronic, awake animals. Carbachol-induced drinking was employed to test the method with 20 male albino Sprague-Dawley rats. Fluid-filled micropipettes (tip diameters: 5-15  $\mu$ ) were stereotaxically implanted in the region of the nucleus of the diagonal band. Up to 3 wks after recovery, ions could be ejected directly into the brains of awake Ss by passing a direct current through the pipette. Iontophoretic ejection of carbachol in doses as low as .05  $\mu$ g elicited drinking. This effect could be blocked by intraperitoneal injection of .5 mg/kg scopolamine. Passage of choline ions produced no detectable effect. The microiontophoretic technique allows direct chemical brain stimulation in chronic, awake animals without major changes in tonic or volume that can occur with crystalline or fluid implants through cannulae. (15 ref)—*Journal abstract*.

11108. Arikuni, T. & Ban, T. (Osaka U, Medical School, Japan) **Excitation and inhibition of hypothalamic neurons by cerebellar stimulation in rabbits.** *Experientia*, 1974, Vol 30(5), 504-505.—Studied 17 rabbits to elucidate further the effects of cerebellar stimulation on unitary activity in the hypothalamus. Electrodes were inserted in their cerebellums prior to electrical stimulation. Results show that in the 62 units recorded, the rate of spontaneous hypothalamic discharge in the control stage ranged from .5 to 38.7 spikes per second while stimulation within the cerebellum was excitatory in 22 units, inhibitory in 16 units, and evoked no response in the remaining 24 units. 2 criteria were used to evaluate the excitatory effect of cerebellar stimulation: (a) unitary spikes were evoked by stimulation and (b) the spontaneous firing rate increased 50-100% of the control rate during cerebellar stimulation and returned to the control rate when excitation ceased. It is concluded that the

inhibitory effect of cerebellar stimulation on hypothalamic neurons is due to a decrease or cessation of excitatory impulses to the hypothalamus. (German summary)—*R. S. Albin*.

11109. Armstrong, S. & Singer, G. (La Trobe U, Bundoora, Vic, Australia) **Effects of intrahypothalamic administration of norepinephrine on the feeding response of the rat under conditions of light and darkness.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 811-815.—Intrahypothalamic injections of norepinephrine were given to 34 male Wistar rats in high and low states of hunger, under conditions of light and darkness. A significant interaction between state of hunger, condition of photoperiod, and drug administration was found. Norepinephrine significantly facilitated feeding in the dark; this effect was more marked in the low hunger state than in the high hunger state. Conversely, norepinephrine significantly depressed feeding in the light, the depression being most marked in the high hunger state. Thus, condition of light is an important determinant of the effects of norepinephrine on feeding. Norepinephrine depressed food-associated drinking under all conditions. (30 ref)—*Journal abstract*.

11110. Atrons, Dale M. & Sinden, John D. (U Sydney, NSW, Australia) **Anatomically-dependent facilitation and inhibition of hypothalamic self-stimulation by food deprivation.** *Behavioral Biology*, 1975(Feb), Vol 13(2), 225-231.—Investigated the effects of food deprivation on hypothalamic self-stimulation in 11 chronically implanted male guinea pigs in a free-operant shuttle-box situation which provided a rate-independent index of reward and an index of aversion. Food deprivation produced anatomically specific reward-modulation effects that were clearly dissociable from general activation or debilitation. All of the posterior electrodes showed increased reward, and all of the anterior electrodes showed decreased reward. In contrast, food deprivation generally exerted very little effect on the aversive component of hypothalamic electrical stimulation. (20 ref)—*Journal abstract*.

11111. Azulay, Alan & Schwartz, Arthur S. (U Florida, Coll of Medicine) **The role of the dorsal funiculus of the primate in tactile discrimination.** *Experimental Neurology*, 1975(Feb), Vol 46(2), 315-332.—Tested the role of the dorsal funiculus for tactile discriminations requiring active exploration of the stimulus object in 8 stump-tailed monkeys. Pairs of patterned disks were constructed with geometric designs of such size and shape as to require active palpation for successful discrimination. For comparison, other stimuli with tactile qualities which could be recognized by a more passive response topography were also used. Section of the dorsal funiculus resulted in severe, long-lasting deficits in discrimination of the patterned disks, while discrimination of the tactile qualities not requiring active exploration was retained. No significant motor impairment was observed. Lesions in the spinothalamic or spinocervical systems had no effect on either type of cutaneous discrimination. Results support the view that the afferents from the monkey hand which travel in the dorsal funiculus are critically and possibly exclusively involved in the perception of tactile stimuli requiring a spatiotem-

poral transformation by the introduction of movement. (30 ref)—*Journal abstract.*

11112. Bassett, J. R. & Cairncross, K. D. (Macquarie U, North Ryde, NSW, Australia) **Time course for plasma 11-hydroxycorticosteroid elevation in rats during stress.** *Pharmacology, Biochemistry & Behavior*, 1975(Jan-Feb), Vol 3(1), 139-142.—Studied the time course of plasma 11-hydroxysteroid elevation in 2 stress situations; regular unsignaled footshock which produces an intermediate steroid elevation and irregular signaled footshock with the possibility of escape, which produces an extreme steroid elevation. Ss were male CSF rats. The initial time course for steroid elevation followed a similar pattern for both treatment groups with the exception that in the irregular signaled group the plasma steroid elevation was more pronounced and there was an indication of biphasic response.—*Journal abstract.*

11113. Benevento, L. A. & Fallon, James H. (U Illinois, Medical Ctr, Chicago) **The projection of occipital cortex to orbital cortex in the rhesus monkey (*Macaca mulatta*).** *Experimental Neurology*, 1975(Feb), Vol 46(2), 402-408.—Near total lesions of occipital cortex were made in 3 rhesus monkeys and the subsequent anterograde degeneration was analyzed using the Fink-Heimer technique. In addition to degenerated terminal endings seen in parietal, temporal, and frontal cortices, sparse to moderately dense pericellular and terminal degeneration was seen in posterior portions of ventral orbital cortex and the inferior prefrontal convexity (lateral orbital cortex). Results indicate that activity from the visual cortex may directly influence cells of the frontal orbital cortex. (17 ref)—*Journal abstract.*

11114. Bernard, Bruce K.; Berchek, James R. & Yutzey, David A. (U Connecticut) **Alterations in brain monoaminergic functioning associated with septal lesion induced hyperreactivity.** *Pharmacology, Biochemistry & Behavior*, 1975(Jan-Feb), Vol 3(1), 121-126.—Rated 30 male albino Wistar rats on 3 consecutive days for reactivity to handling. Ss were then assigned to behaviorally equivalent groups and received either bilateral septal lesions or a sham operation. Following 2 days of recovery, all Ss received an additional behavioral testing session. Immediately following this last test, norepinephrine (NE) and dopamine (DA) levels, instantaneous rate constants (k), turnover times (TT), and utilization rates (K) as well as the levels of serotonin (5-HT) and 5-hydroxyindoleacetic acid (5-HIAA) in the hypothalamus, limbic system, cortex and pons-medulla were determined fluorometrically. Ss with septal lesions were significantly more reactive to handling, while the behavior of sham-operated controls remained essentially unchanged. Significant reductions in hypothalamic NE and DA and limbic DA were observed in the septal lesion Ss. Catecholamine, 5-HT, and 5-HIAA levels in other brain parts were unaffected. Results support the hypothesis of a catecholaminergic involvement in affective behavior but do not demonstrate any alteration in the functional dynamics of the brain monoamines associated with the hyperreactivity induced by septal lesions. (29 ref)—*Journal abstract.*

11115. Bhargava, Hemendra N.; Chan, S. L. & Way, E. Leong. (U California, Medical School, San Francisco) **Influence of hemicholinium (HC-3) on morphine analge-**

**sia, tolerance, physical dependence and on brain acetylcholine.** *European Journal of Pharmacology*, 1974(Dec), Vol 29(2), 253-261.—Administered HC-3 intracerebrally in male Swiss-Webster mice at a dose which reduced brain acetylcholine (ACh) without any change in choline (Ch) levels. HC-3 antagonized morphine antinociception slightly as measured by inhibition of the tail-flick response, in both naive Ss and in Ss rendered tolerant to and dependent on morphine by pellet implantation. However, the development of tolerance to morphine and of dependence on morphine were not affected by HC-3. Although naloxone-precipitated withdrawal jumping was enhanced irrespective of whether the HC-3 was administered before or after the dependence on morphine had developed, body weight loss during abrupt withdrawal was unaffected by HC-3. Results indicate that although some of the acute and withdrawal effects of morphine may be associated either directly or indirectly with acetylcholine, these actions do not appear to be the primary process responsible for initiating the development of tolerance and dependence. (27 ref)—*Journal abstract.*

11116. Brus, R.; Herman, Z. S. & Kostman, F. (Silesian School of Medicine, Inst of Biology & Physiology, Zabrze, Poland) **Behavioral effects of norepinephrine and dibutyl 3', 5' AMP in centrally sympathectomized rats.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 719-724.—In experiments with a total of 94 male Wistar rats, Ss were injected intraventricularly with 2 doses of 250 µg of 6-hydroxydopamine (6-OHDA) at a 48-hr interval. 7 days after the 2nd injection, 50 µg of norepinephrine (NE) or 100 µg of dibutyl cyclic 3', 5' adenosine monophosphate (DCAMP) were injected intraventricularly. There were no differences in gross behavior, but an increase in irritability was observed in Ss treated with 6-OHDA compared with controls. NE increased locomotor activity and irritability. Chemical sympathectomy intensified locomotor excitation and irritability caused by NE. DCAMP caused an increase of locomotor activity, irritability, and convulsions 30 min after injection. These behavioral phenomena were intensified in Ss treated with 6-OHDA. It is suggested that 6-OHDA sensitized the central nervous system to action of NE and DCAMP. (33 ref)—*Journal abstract.*

11117. Chalmers, Donald V. & Levine, Seymour. (Stanford U, Medical School) **The development of heart rate responses to weak and strong shock in the preweaning rat.** *Developmental Psychobiology*, 1974(Nov), Vol 7(6), 519-527.—Studied heart rate (HR) responses to 2 intensities (.2 and 2.0 ma) of electric shock in 63 rat pups at age 5, 7, 9, 11, 13, 15, 17, 19, and 21 days. Both weak and strong shock elicited at least some HR acceleration at all ages. Beginning on Day 13, a deceleratory component was added to the response to weak shock. HR acceleration was significantly greater in response to strong shock on Days 5 and 7 and then again from Days 15-21. Strong shock also elicited a relatively long-latency bradycardia beginning with Day 11. Results are discussed in terms of the emergence of 3 response tendencies: (a) the orienting reflex, (b) the defensive reflex, and (c) a change in the state of the organism. Their possible implications for the study of preweaning

shock on subsequent behavior are also discussed. (22 ref)

11118. Cooper, Anthony. (Miami U) **Effects of accessory olfactory bulb lesions on the sexual behavior of male mice.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 419-420.—2 groups ( $N = 25$ ) of sexually inexperienced male C57 BL/6J mice received lesions to their olfactory bulbs. One group received bilateral lesions in the area of the accessory olfactory bulbs, and the other received lesions of similar size but positioned more anteriorly. Subsequent to the operation, Ss of both groups were found to exhibit lower levels of sexual behavior than did a control group. Although no effect specific to the lesioning of the accessory bulbs was found, the study shows that olfactory bulb lesions of very limited extent can disrupt the sexual behavior of the male mouse without causing the S to become anosmic.

11119. Deutsch, J. A. & Dennis, Stephen G. (U California, San Diego) **Adaptation of aversive brain stimulation: Effects of pulse frequency.** *Behavioral Biology*, 1975(Feb), Vol 13(2), 245-250.—4 male Sprague-Dawley rats with electrodes implanted in the medial lemniscus were trained to terminate intermittent electrical pulse trains by pressing a lever. These Ss also maintained responding when the leverpress produced a continuous pulse train, but only at the higher pulse frequencies tested. This is taken to be evidence of frequency-dependent adaptation of central aversive stimulation. (18 ref)—*Journal abstract.*

11120. Domino, Edward F.; Wilson, Ann E. & Olds, Marianne E. (U Michigan) **Relation of rat brain acetylcholine levels to duration of self-stimulation and escape behavior.** *Pharmacology, Biochemistry & Behavior*, 1975(Jan-Feb), Vol 3(1), 103-107.—Describes experiments with 220 male albino Holtzman rats in which total brain acetylcholine (ACh) was assayed in groups of Ss after periods of operant responding maintained by electrical stimulation of the lateral posterior hypothalamus or of escape behavior induced by electrical stimulation of the midbrain tegmentum. Brain stimulation decreased total brain ACh, regardless of whether the stimulation was positive or negative. Ss that received positive stimulation while being paralyzed showed similar decreases in total brain ACh, but the change in ACh was smaller. No changes occurred in Ss that were paralyzed that received no electrical stimulation. It is concluded that brain usage produced by electrical stimulation of discrete functional pathways causes a reduction of total ACh, but this is unrelated to the reduction of total ACh, but this is unrelated to the specific motivational properties of the electrical stimuli. (29 ref)—*Journal abstract.*

11121. Garbarg, Monique; Barbin, Gilles; Feger, Jean & Schwartz, Jean-Charles. (Inst National de la Santé & de la Recherche Médicale, Paris, France) **Histaminergic pathway in rat brain evidenced by lesions of the medial forebrain bundle.** *Science*, 1974(Nov), Vol 186(4166), 833-835.—Cites research which suggests a role for brain histamines analogous to other biogenic amines, such as catecholamines and serotonin, and that histamine is a central neurotransmitter. The present experimental evidence shows that diencephalic lesions involving the medial forebrain bundle induce a decrease in histamine

and l-histidine decarboxylase activity in a manner suggesting that it is due to degeneration of histaminergic fibers in the telencephalon which comprise the bulk of the ascending noradrenergic and serotonergic fibers. (38 ref)

11122. Glick, Stanley D. (Mt Sinai School of Medicine, City U New York) **Recovery of function and changes in sensitivity to amphetamine following caudate lesions in rats.** *Behavioral Biology*, 1975(Feb), Vol 13(2), 239-244.—Trained 12 female Sprague-Dawley albino rats to barpress for water reinforcement. 8 Ss were administered various doses of intraperitoneal dextroamphetamine both before and 6-8 wks after bilateral lesions of the caudate nucleus. Preoperatively, low doses (.25-.5 mg/kg) increased responding and high doses (2.0-4.0 mg/kg) depressed responding. Postoperatively, the dextroamphetamine dose-response curve was shifted to the left in Ss with small caudate lesions and shifted to the right in Ss with larger caudate lesions. Although both lesions produced initial impairments of barpressing rates, only the larger lesion resulted in a persistent impairment. The lesion-induced hyper- and hyposensitivity to dextroamphetamine were, therefore, associated with greater and lesser degrees of functional recovery, respectively.

11123. Goldstein, Melvin L. (Indiana U, Kokomo) **The effect of amygdectomy on long-term retention of an undertrained classically conditioned fear response.** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 548-550.—16 male hooded rats trained in the classical conditioning fear response were subjected to amygdectomy 24 hrs after conditioning and were tested for retention 4 days and 4-7 wks postoperatively. Results indicate that amygdectomy disrupted the intermediate and long-term retention of the classically conditioned fear response. There was no recovery of performance after the amygdectomy. Data confirm previous reports of retention deficits after amygdectomy in undertrained Ss, but do not corroborate previous reports of recovery of function, with additional training, after amygdectomy.—*Journal abstract.*

11124. Hodos, William & Bonbright, James C. (U Maryland) **Intensity difference thresholds in pigeons after lesions of the tectofugal and thalamofugal visual pathways.** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1013-1031.—Obtained visual intensity difference thresholds from 11 White Carneaux pigeons before and after thalamic lesions. Ss with lesions in nucleus rotundus (the thalamic component of the tectofugal pathway) showed moderate postoperative threshold elevations. After extensive retraining the thresholds returned to the preoperative value. Ss with lesions in the nucleus opticus principalis (OPT), the thalamic component of the thalamofugal pathway, had smaller postoperative threshold elevations than the nucleus rotundus cases, but the deficit did not diminish after extensive retraining. Ss with combined lesions of both pathways (OPT + rotundus) had severe postoperative threshold elevations, which declined with retraining to the level of the Ss with OPT lesions, but not to the preoperative level. (36 ref)

11125. Hole, Kjell & Lorens, Stanley A. (U Bergen, Norway) **Response to electric shock in rats: Effects of selective midbrain raphe lesions.** *Pharmacology, Biochemistry & Behavior*, 1975(Jan-Feb), Vol 3(1), 95-102.—Reports that the forebrain serotonin (5-hydroxytryptamine; 5-HT) concentrations of 16 Möll-Wistar rats with lesions in the median (M), dorsal (D), or both (DM) midbrain raphe nuclei were, respectively, 22, 48, and 70% lower than in 10 control animals. The lesion and control groups, however, did not evidence differences in pain sensitivity as measured by the flinch-jump technique. Those Ss with M and DM lesions required more trials than controls to acquire a one-way avoidance response. D lesion rats did not differ from controls in one-way avoidance learning, except in terms of prolonged escape latencies during the 1st 3 trials. The previously reported increased sensitivity to painful stimuli subsequent to medial forebrain bundle lesions or para-chlorophenylalanine administration, therefore, does not appear to be due exclusively to disruption of ascending 5-HT fibers originating in the dorsal and median raphe nuclei. (32 ref)—*Journal abstract*.

11126. Johansson, Gunnar G.; Kalimo, Raija; Niskanen, Harri & Ruusunen, Selja. (U Helsinki, Finland) **Effects of stimulation parameters on behavior elicited by stimulation of the hypothalamic defense area.** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1100-1108.—Elicited agonistic behavior by stimulating the ventromedial hypothalamus of 22 domestic cats. 12 different behavioral components were rated separately. Behavioral alerting, mydriasis, retraction of ears, piloerection, hissing, and protrusion of claws were the most characteristic components. The parameters of the stimulus were shown to be important determinants of the nature of the behavior. Results suggest that either discrete central neural circuits for the different components of agonistic behavior are diffusively organized within the ventromedial hypothalamus, or the components result from a general activation of neurons subserving discrete fixed-action patterns, the resultant behavior being determined by different factors, such as the intensity of the activation. (28 ref)—*Journal abstract*.

11127. Kaelber, W. W. et al. (U Iowa) **Centrum medianum-parafascicularis lesions and reactivity to noxious and non-noxious stimuli.** *Experimental Neurology*, 1975(Feb), Vol 46(2), 282-290.—Trained 15 adult cats to escape electrical stimuli delivered to the pulp of the upper left canine tooth and to press a lever to obtain food. Subsequently, electrolytic lesions were produced in the medial thalamus. Ss were again tested 2-3 wks later. In addition they were trained in an avoidance conditioning paradigm, using grid shock delivered to the paws as the unconditioned stimulus. There was no correlation between the effect of the lesion on noxious vs nonnoxious stimuli; all operated Ss learned to avoid the grid shock when a warning signal appeared. In addition, it appears that destruction of the rostral portion of the nuclei centrum medianum and parafascicularis is most critical for abolishing the escape response to tooth pulp stimulation.—*Journal abstract*.

11128. Knispel, Joel D. & Siegel, Jerome. (U California, Mental Retardation Ctr, Los Angeles) **Habi-**

**tuation of aversive reticular stimulation effects on evoked potentials.** *Brain Research*, 1973, Vol 56, 340-344.—In 3 chronic cats late components of the cortical evoked potential (EP) to a light flash or shock of the optic tract were modified by preceding reticular stimulation, which in previous sessions had been found to elicit behavior indicating aversion. The changes in the EP are proposed as a sensitive central indicator of aversion. In a 2nd session which followed a re-adaptation period to pretest levels of EP amplitudes, reticular stimulation had less effect on EP amplitude. (25 ref)—B. Preilowski.

11129. Lucas, E. A. & Sterman, M. B. (U Arkansas, Medical Ctr, Little Rock) **Effect of a forebrain lesion on the polycyclic sleep-wake cycle and sleep-wake patterns in the cat.** *Experimental Neurology*, 1975(Feb), Vol 46(2), 368-388.—Tested the hypothesis that regulation of a polyphasic sleep-wake cycle in the cat is directed in large part by structures in the basal forebrain region. 11 cats were trained to produce an operant EEG response for food to assess behavioral periodicity. Electrographic data were analyzed for sleep-wake patterns, mean periodicity of the REM and operant performance (basic rest-activity) cycle and polyphasic sleep-wake cycle. Bilateral lesions placed in the basal forebrain markedly suppressed expression of sleep for more than 3 wks. These lesions significantly shortened the mean periodicity of the polyphasic sleep-wake cycle, but not that of the basic rest-activity cycle. Data support the hypothesis that basal forebrain structures are involved in the genesis and control of slow-wave sleep and the polyphasic sleep-wake cycle. (38 ref)—*Journal abstract*.

11130. Mareš, Pavel. (Czechoslovak Academy of Sciences, Prague) **Bioelectrical activity of an epileptogenic focus in rat neocortex.** *Brain Research*, 1973, Vol 56, 203-213.—Conducted an experiment on 45 unanesthetized male rats, in which the bioelectrical activity of a neocortical epileptogenic focus produced by the application of penicillin to the frontal, temporal, or occipital region of the cortex was recorded. The discharges from the primary foci had the same basic shape, irrespective of the site of the focus. The only difference was found in afterdischarges, the low incidence of which in the temporal region is probably due to poorer thalamocortical connections in this zone. Marked differences were found between the various regions in the shape of the projected discharge of the mirror focus, and hence in the manner of activation of the contralateral cortex. (29 ref)—*Journal summary*.

11131. Massotti, M.; Scotti de Carolis, A. & Longo, V. G. (Istituto Superiore di Sanità, Lab di Chimica Terapeutica, Rome, Italy) **Effects of three dihydroxylated derivatives of tryptamine on the behavior and on brain amine content in mice.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 769-775.—Investigated the effects on behavior and on cerebral bioamine content in 3 dihydroxylated tryptamine derivatives (5,6-DHT, 5,7-DHT and 6,7-DHT) administered intracerebrally to a total of 650 mice. Both 5,6-DHT and 5,7-DHT caused a 50-70% lowering of 5-hydroxytryptamine (5-HT) content in whole brain which lasted for the entire experimental period (20 days). 5,6-DHT and 5,7-DHT differed in their effects on norepinephrine (NE)

and dopamine (DA). While the former induced a DA diminution to an extent comparable to that observed for 5-HT and a rise in NE, the latter induced a lowering of NE and affected DA only slightly. 5,6-DHT decreased spontaneous activity of treated Ss at 21 and 43  $\mu$ g; the effect was dose-related. 5,7-DHT diminished spontaneous activity only at 43  $\mu$ g. Following either 5,6-DHT or 5,7-DHT, 5-hydroxytryptophan induced an exaggerated tremorigenic response; this potentiation may be related to an impaired uptake of 5-HT by the terminals. 6,7-DHT, while more toxic than the other 2 drugs, showed a much weaker effect both on brain amines content and on behavior. (18 ref)—*Journal abstract*.

11132. McEwen, G. N. (NASA, Ames Research Ctr, Moffett Field, CA) **A universal bird head-holder for stereotaxic surgery.** *Electroencephalography & Clinical Neurophysiology*, 1974(Dec), Vol 37(6), 657-658.—Describes a head-holder which can accommodate several different sizes of birds with different beak configurations. The apparatus is basically simple and easily machined. (French summary)

11133. Nir, I.; Weller, C. P. & Sulman, F. G. (Hebrew U, School of Pharmacy, Jerusalem, Israel) **Behavioural effect of intraventricular application of methoxy-indolealkylamines in the rat.** *Psychopharmacologia*, 1974, Vol 39(4), 323-329.—Behavioral profiles of 23 biogenic tryptamine derivatives and related compounds were determined by injecting the substances into the lateral ventricles of unanesthetized male Sabra strain rats using the Feldberg technique. The synthetic compound 5,6,7-trimethoxy-N-dimethyl-tryptamine (TNDT) acted quite differently from all the other biogenic tryptamines studied, having a marked behavioral effect with lack of interest in the surroundings and induction of palpebral ptosis but no inhibition of spontaneous activity. It raised the level of emotionality in Ss with conditioned fear responses and, moreover, the effects of TNDT persisted for more than 10 days as opposed to an active period of only 2-3 hrs obtained with the other tryptamines. The possibility that TNDT may be produced by an inborn error of enzyme formation in human psychotics is considered.—*Journal abstract*.

11134. Ott, T.; Schmitt, M.; Krug, M. & Matthies, H. (Medizinische Akademie Magdeburg, Inst für Pharmakologie und Toxicologie, Leipziger, E Germany) **Intrahippocampal injection of chemicals: Analysis of spread.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 715-718.—Investigated the spreading of solutions of chemicals in the brains of 21 male Wistar rats after topical cerebral injection (TCI). Detection of radioactivity in different brain regions after intrahippocampal injection of  $^3$ H-otic acid revealed a distribution pattern that cannot be explained by radial diffusion of the substance from the site of injection. The EEG flattening induced by application of potassium chloride (spreading depression) was used as an additional index of the distribution of a chemical after injection into the hippocampus. The biochemical and electrophysiological experiments showed 2 ways of spread to be of importance to the distribution pattern under the experimental conditions chosen: (a) spreading by transport up the outside of the implanted microcannula and (b) flow back of the substance into the ventricular system with

subsequent diffusion into adjacent brain structures. This type of distribution was almost independent of the physicochemical properties of the substance injected. Therefore, when using TCI, it should be taken into consideration that the substance might spread into other brain areas. (17 ref)—*Journal abstract*.

11135. Pasik, Tauba & Pasik, Pedro. (Mt Sinai School of Medicine, City U New York) **Extrageniculate vision in the monkey: IV. Critical structures for light vs. no-light discrimination.** *Brain Research*, 1973, Vol 56, 165-182.—14 monkeys (*Macaca mulatta*) were able to relearn a light/no light discrimination after complete bilateral excision of striate cortex and partial ablation of areas 18 and 19. Additional bilateral lesions of the temporal neocortex, or posterior parahippocampal and retrosplenial allocortex, or pulvinars, or superior colliculi did not interfere significantly with the relearned habit. When the additional damage involved the superior colliculi and medial pretectum, there was a major discrimination deficit, but eventually these Ss could reach the criterion level. Only when the lateral pretecal region was included in the later lesion was there a failure to master the test in 6,000 trials of postoperative testing. The effective damage caused severe bilateral degeneration of the nucleus of the accessory optic tract. The accessory optic system is seen to be a main source of visual input for the capacity to perform luminous flux discrimination tests in the absence of striate cortex. (40 ref)—*Journal summary*.

11136. Pert, Agu & Yaksh, Tony. (Biomedical Lab, Edgewood Arsenal, MD) **Localization of the antinociceptive action of morphine in primate brain.** *Pharmacology, Biochemistry & Behavior*, 1975(Jan-Feb), Vol 3(1), 133-138.—Microinjections of morphine sulfate (20-40  $\mu$ g) were made into various subcortical regions of the brains of 7 rhesus monkeys. The effects of these injections were evaluated on the nociceptive threshold as defined by the shock titration technique. Results indicate that the region of maximal antinociceptive sensitivity to morphine in the primate is the periventricular-periaqueductal gray matter. It is tentatively suggested that morphine lowers that affective tone or the aversive component of pain by its action on the midbrain central gray and periventricular areas—both important projection and integration areas of the extralemniscal somatosensory system. (36 ref)—*Journal abstract*.

11137. Price, Marion T. & Fibiger, Hans C. (U British Columbia, Div of Neurological Sciences, Vancouver, Canada) **Apomorphine and amphetamine stereotypy after 6-hydroxydopamine lesions of the substantia nigra.** *European Journal of Pharmacology*, 1974(Dec), Vol 29(2), 249-252.—Bilateral lesions of the substantia nigra with 6-hydroxydopamine abolished amphetamine-induced stereotypy in 21 male Wistar rats, compared to 11 controls, but potentiated the stereotypic effects of apomorphine. The lesions reduced neostriatal dopamine to less than 2% of the control value. These observations are at variance with a recent report by B. Costall et al (1972) in which it was found that bilateral electrolytic lesions of the substantia nigra abolished apomorphine-induced stereotypy but did not affect amphetamine stereotypy. The present data point to the questionable value of attempting to interpret the behavioral conse-

quences of lesions to central catecholamine neurons in the absence of either biochemical or histochemical verification. Data support the view that amphetamine acts indirectly by increasing the release of catecholamines, while apomorphine directly stimulates central dopamine receptors. (15 ref)—*Journal abstract*.

11138. Rose, James D. & Sutin, Jerome. (Dartmouth Coll) **Effects of lesions in the lateral medulla on mating and responses to genital stimulation in female cats.** *Brain Research*, 1973, Vol 56, 350-354.—Lesions of the lateral reticular nucleus and lateral tegmental field in 6 cats attenuated or abolished the estrous cry and after-reaction to mating and vaginal probing. Lateral tail deflection, lordosis, and treading were not impaired, and spontaneous vocalization and general affective responsiveness to nociceptive stimuli were not affected.—*B. Preilowski*.

11139. Roy, J. C.; Delerm, B. & Granger, L. (U Lille, Lab de Psychophysiologie, Villeneuve d'Ascq, France) **[Bulbar inhibition of skin potential responses in the cat.]** (Fren) *Electroencephalography & Clinical Neurophysiology*, 1974(Dec), Vol 37(6), 621-632.—Skin potential responses (SPR) elicited by stimulation of the mesencephalic reticular formation are inhibited by simultaneous stimulation of the bulbar reticular formation. The mechanisms of this inhibition, its anatomical origin, and its pathways were studied in 40 anesthetized cats. Results show that the inhibitory points are located within the posterior gigantocellular nucleus, the paramedian reticular nucleus, and the ventral reticular nucleus. Partial lesions of the spinal cord, ipsilateral to the stimulated bulbar area, suppress the inhibition of SPR recorded from the ipsilateral hind paw. The effects on blood pressure of stimulating the bulbar inhibitory areas confirm the functional heterogeneity of the bulbar inhibitory structures. The inhibition of SPR through bulbar stimulation is accompanied, in very lightly anesthetized Ss, by strong cortical arousal; hence it is concluded that SPR inhibition is not a result of diffuse depression of the mesencephalic activating system. (39 ref)—*English summary*.

11140. Schultze, Maribeth J. & Stein, Donald G. (Clark U) **Recovery of function in the albino rat following either simultaneous or seriatim lesions of the caudate nucleus.** *Experimental Neurology*, 1975(Feb), Vol 46(2), 291-301.—Studied acquisition of spatial alternation performance and passive avoidance behavior following seriatim lesions of the caudate nucleus in 35 male albino Charles River CD rats. Lesions of the caudate nucleus were created by electrocoagulation, either bilaterally at 1 operation or in 2 sequential unilateral stages with a 25-day interlesion interval. 10 Ss having 1-stage caudate lesions were impaired on spatial alternation when compared with 14 2-stage and 11 sham-operated Ss. Ss with 2-stage lesions were better on passive avoidance than Ss with 1-stage lesions and sham-operated controls. These latter differences could not be accounted for by shock threshold or water consumption differences. There were no differences in the extent of the lesions between Ss that were subjected to 1- and 2-stage operations. Findings indicate that significant functional differences are produced by 1-stage vs 2-stage

lesions of the rat caudate nucleus. (25 ref)—*Journal abstract*.

11141. Sinnamon, Harry M. & Schwartzbaum, J. S. (U Rochester, Medical Ctr) **Dorsal hippocampal unit and EEG responses to rewarding and aversive brain stimulation in rats.** *Brain Research*, 1973, Vol 56, 183-202.—Both rewarding and aversive brain stimulation can produce strong theta responses in the dorsal hippocampus of the rat and nonspecific increases or decreases in the activity of most units. A selectivity of the hippocampal response is indicated by changes in fast EEG activity and in the activity of a relatively small number of units. (42 ref)—*Journal abstract*.

11142. Spiro, Robert T. & Kolbert, Gerald S. (Austen Riggs Ctr, Stockbridge, MA) **A new technique for visual deprivation.** *Electroencephalography & Clinical Neurophysiology*, 1974(Dec), Vol 37(6), 654-656.—Describes a new procedure for functional visual deprivation which consists of splitting both the upper and lower lid margins from the medial to lateral canthus, forming 2 lamellae—an anterior skin muscle layer and a posterior tarsoconjunctival layer. The technique is permanent, uncomplicated to implement, and requires no postoperative care; it is also superior to lid suture alone when both functional and complete light deprivation are required. (French summary)

11143. Squire, Larry R. (VA Hosp, La Jolla, CA) **A stable impairment in remote memory following electroconvulsive therapy.** *Neuropsychologia*, 1975(Jan), Vol 13(1), 51-58.—20 38-72 yr old psychiatric inpatients receiving a course of electroconvulsive therapy (ECT) for relief of depressive illness were given a test of remote memory for public events covering the years 1940-1969. An impairment in remote memory, covering nearly the entire time period sampled by the test, developed during the 1st 5 treatments. This impairment was present during the 1st hr after the 5th treatment and persisted unchanged for at least 24 hrs thereafter. ECT did not affect performance on the verbal portion of the WISC. Apparently, the amnesia produced by ECT can involve a large portion or perhaps all of remote memory, in addition to recent memory. The relevance of these results to the neural substrates underlying storage and recall is discussed. (French & German summaries) (37 ref)—*Journal abstract*.

11144. Trulson, Michael; Nicolay, John & Randall, Walter. (Princeton U) **Abnormalities in grooming behavior and tryptophan hydroxylase activity in the superior colliculi in cats with pontile and frontal neocortical lesions.** *Pharmacology, Biochemistry & Behavior*, 1975(Jan-Feb), Vol 3(1), 87-94.—In an experiment with 26 adult male cats, Ss with pontile or frontal neocortical lesions displayed a dissociation of the appetitive and consummatory components of grooming behavior when their body surface was tactually stimulated, an abnormal behavior that waxes and wanes with the seasons of the year. Tryptophan hydroxylase activity was significantly decreased in the superior colliculi of Ss with pontile lesions and of Ss with frontal neocortical lesions. Results suggest that the change in tryptophan hydroxylase activity is mediated neuronally and is a transneuronal effect on the serotonergic input to the superior colliculi. Pharmacological manipulations of the serotonergic

system in normal Ss failed to induce the abnormal behavior, indicating that other factors are involved in the genesis of the abnormal behavior. (47 ref)—*Journal abstract*.

11145. Türker, M. N. & Türker, R. K. (Ankara U, Dental Faculty, Turkey) **A study on the peripheral mediators of dental pain.** *Experientia*, 1974, Vol 30(8), 932-933.—Studied the role of the release of bradykinin and prostaglandin-like material from the tooth pulp in dental pain. Bipolar electrodes were implanted in 16 adult dogs. The stimulation of dentine by these electrodes produced a pain reaction as well as a release of bradykinin and prostaglandin-like chemicals from the tooth pulp. The effect of aprotinin (Trasylol) and indomethacin on such release is discussed. The former, but not the latter, significantly increases the pain threshold induced by dentine stimulation. It is considered unlikely that prostaglandins act directly by stimulating sensory nerve endings, but they might sensitize the nerve endings to bradykinin. (German summary)—R. S. Albin.

### Drug Effects

11146. Abernathy, Charles O.; Lukacs, Lorinc & Zimmerman, Hyman J. (VA Hosp, Washington, DC) **Toxicity of tricyclic antidepressants to isolated rat hepatocytes.** *Biochemical Pharmacology*, 1975(Feb), Vol 24(3), 347-350.—Tests for cytotoxicity showed the relative potency of tricyclic antidepressants to be chlorimipramine > amitriptyline > nortriptyline > desipramine > protriptyline > imipramine. Chlorimipramine was the most cytotoxic and 10 times more potent than imipramine. The relevance of these effects in vitro to hepatic injury in clinical circumstances remains to be determined. (25 ref)

11147. Adams, R. G. (Vale Drive Clinic, Barnet, England) **Pre-sleep ingestion of two hypnotic drugs and subsequent performance.** *Psychopharmacologia*, 1974, Vol 40(2), 185-190.—Administered 2 dose levels of 2 depressant drugs, nitrazepam and butobarbitone, and a placebo under presleep, blind conditions to 12 healthy, individually tested Ss. Ss attempted 5 15-min tasks in a balanced, latin-square design. The high dose of each drug increased the time on task decline in a short-term memory (STM) task. STM did not show a definite time of day effect. Proofreading was superior in the morning, but concept identification was faster in the afternoon. Results imply that an appropriate short test, such as STM, can detect the effect of an hypnotic drug administered to induce sleep.—*Journal abstract*.

11148. Ahlenius, Sven & Engel, Jörgen. (U Göteborg, Sweden) **Behavioral stimulation induced by ethanol withdrawal.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 847-850.—Describes a model for the study of an ethanol withdrawal syndrome on operant behavior. 4 male Sprague-Dawley rats maintained on 16% w/v solutions of ethanol for several months were trained to perform on a differential reinforcement of low rates schedule. On withdrawal of ethanol the interresponse times were significantly shortened concomitant with an increase in the total number of responses, compared to the 11 control Ss ( $p < .01$ ).—*Journal abstract*.

11149. Ambrozil, L. (Vienna Municipal Ctr for the Handicapped, Austria) **[Contribution to the objectivization of data in psychopharmacology.]** (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1973, Vol 21(4), 376-377.—Discusses psychopharmacological research and the clinical psychologist's important contribution, through independent and objective measurements and data, to obtaining objective research results. The various methods and procedures used (tests, questionnaires, etc.) are briefly surveyed and evaluated. (English summary)

11150. Ayd, Frank J. (Taylor Manor Hosp, Ellicott City, MD) **Side effects of depot fluphenazines.** *Comprehensive Psychiatry*, 1974(Jul-Aug), Vol 15(4), 277-284.—Reviews reported side effects from the use of fluphenazine enanthate and fluphenazine decanoate in 300,000 users over a 9-yr period. These drugs are considered as safe as any potent neuroleptic.

11151. Azbekiy, S. G. & Lapin, I. P. (Bekhtereva Psychoneurological Inst, Leningrad, USSR) **[The effect of serotonergic and adrenergic preparations upon alcohol-induced excitation in mice.]** (Russ) *Farmakologiya i Toksikologiya*, 1974(Jul-Aug), Vol 37(4), 393-396.—Tested the effects of a series of serotonergic and adrenergic preparations, introduced intraperitoneally, on alcoholic excitation induced in mice by the administration of ethanol (1.0, 1.5, and 2.0 mg/g). The amount of locomotion and of rearing onto the hind legs were measured for 3 min, 15 min after the introduction of ethanol, as indicators of alcoholic intoxication. From the different effects of the substances it is concluded that serotonergic structures are primarily involved in the excitatory effect of ethanol on locomotion. (English summary)—A. G. Pook.

11152. Barker, Jeffrey L. (NIH, National Inst of Child Health & Human Development, Bethesda, MD) **Activity of CNS depressants related to hydrophobicity.** *Nature*, 1974(Nov), Vol 252(5478), 52-54.—Analyzed data derived from vertebrate and invertebrate preparations. It was determined that much of the depression of central nervous system excitability noted following administration of ethanol, urethane, chloralose, chloroform, pentobarbital, or diphenylhydantoin is due to a selective depression of postsynaptic mechanisms and is correlated with hydrophobicity. (47 ref)

11153. Barnett, Allen; Goldstein, Jeffrey; Fiedler, Ellen & Taber, Robert. (Schering Corp, Bloomfield, NJ) **Etonitazine-induced rigidity and its antagonism by centrally acting muscle relaxants.** *European Journal of Pharmacology*, 1975(Jan), Vol 30(1), 23-28.—Conducted studies with male Sprague-Dawley rats to characterize etonitazine-induced rigidity of the trunk and limb musculature more fully, to compare the degree of rigidity with that produced by morphine, codeine, and methadone, and to assess the sensitivity of this rigidity to centrally acting muscle relaxants. Of the 4 narcotics tested, subcutaneous etonitazine was far more potent than methadone or morphine for producing rigidity; codeine did not produce comparable peak rigidity. Etonitazine-induced rigidity occurred at a supraspinal level since the effect was prevented by spinal transection. Etonitazine-induced rigidity was prevented by the narcotic antagonists cyclazocine, pentazocine, and na-

loxxone but not by the serotonin depletor, p-chlorophenylalanine. Etonitazine-induced rigidity was antagonized by centrally acting muscle relaxants, including diazepam, methocarbamol, carisoprodol and zoxazolamine. —*Journal abstract.*

11154. Beaton, J. M.; Pegram, G. V.; Smythies, J. R. & Bradley, R. J. (U Alabama, Medical Ctr) **The effects of nicotinamide on mouse sleep.** *Experientia*, 1974, Vol 30(8), 926-927.—Half of 30 adult, male, random-bred Swiss mice were injected daily with saline and the other half with 250 mg/kg nicotinamide. On Day 19, Ss were implanted with 4 cortical electrodes, and injections continued daily. Beginning with Day 22, EEGs were recorded and REM sleep was shown to have increased significantly for Ss treated with nicotinamide. A 2nd experiment confirmed these findings. Results are discussed in terms of their implications for the usage of niacin (nicotinic acid) in treating schizophrenia. It is suggested that high doses of nicotinamide may have behavioral effects unconnected with its role as a vitamin. (French summary)—*R. S. Albin.*

11155. Beecham, I. J. & Handley, Sheila L. (U Aston, Pharmacological Lab, Birmingham, England) **Potentiation of catalepsy induced by narcotic agents during Haffner's test for analgesia.** *Psychopharmacologia*, 1974, Vol 40(2), 157-164.—Morphine and tail-clip catalepsy were antagonized by nalorphine and atropine, although haloperidol catalepsy was abolished in the presence of the clip. It is suggested that morphine must have at least 2 sites of action in producing catalepsy to account for these results.

11156. Bonnet, Kenneth A. & Peterson, Karen E. (New York U, Medical School) **A modification of the jump-finch technique for measuring pain sensitivity in rats.** *Pharmacology, Biochemistry & Behavior*, 1975(Jan-Feb), Vol 3(1), 47-55.—Considers that the jump-finch procedure provides a sensitive alternative to the hot-plate and tail-flick procedures. Analysis of the components of motor responses to increasing intensity of foot shock presentation was performed to identify 5 reliably elicited categories of unlearned responses to inescapable foot shock. Morphine sulfate differentially altered response category thresholds in rats. Response category thresholds also differed between Wistar and Fisher strain rats in analgesic effects of morphine sulfate. (17 ref)—*Journal abstract.*

11157. Brookshire, Kenneth H. (Franklin & Marshall Coll) **Function of the "onset of illness" in the preference changes of alloxan-diabetic rats.** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1069-1072.—144 male Sprague-Dawley rats were given access to saccharin or NaCl solutions as a conditioned stimulus (CS) at 1 of several times before and after injection with alloxan as an unconditioned stimulus (UCS) and were compared with controls (given UCS but no CS exposure) on their preference for the CS 7 days after the diabetes was well established. Results indicate that Ss exposed to the UCS at 1 or 2 hrs prior to the CS or at 1, 2, or 6 hrs following the CS all formed a conditioned aversion, whereas those with 6, 24, or 48 hrs between UCS and CS showed no greater aversion to the CS than controls. It is suggested that while the onset of alloxan diabetes can serve as the UCS for a conditioned

taste aversion, the behavior of alloxan-diabetic rats towards saccharin does not depend upon this process. —*Journal abstract.*

11158. Brookshire, Kenneth H. (Franklin & Marshall Coll) **Changes in the rat's preference for saccharin and sodium chloride solutions following injection of alloxan monohydrate.** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1061-1068.—Conducted 5 experiments with a total of 136 male Sprague-Dawley rats in which alloxan-diabetic rats were compared with saline-injected controls on 2-choice preference tests involving saccharin and water or NaCl and water. Previous results indicating a decrease in preference for saccharin were confirmed and extended. However, a similar pattern of preference change for NaCl was not found. Results indicate that saccharin and NaCl consumption were not affected in the same way by experimental diabetes and that the loss of palatability of saccharin during a chronic diabetic state was not consistent with learning models of taste-aversion formation. —*Journal abstract.*

11159. Browne, Ronald G. & Ho, Beng T. (Texas Research Inst of Mental Sciences, Houston) **Discriminative stimulus properties of mescaline: Mescaline or metabolite?** *Pharmacology, Biochemistry & Behavior*, 1975(Jan-Feb), Vol 3(1), 109-114.—Studied possible similarities in the interoceptive stimuli produced by mescaline and its metabolites. 20 male Sprague-Dawley rats were trained in a 2-lever operant chamber to discriminate between the drugged state (mescaline 25 mg/kg) and the nondrugged state (saline). Following acquisition of discriminative response control, Ss were pretreated with either saline, aldehyde dehydrogenase inhibitors, or amine oxidase inhibitors and tested for stimulus generalization produced by intraperitoneal injections of 3,4,5-trimethoxyphenylethanol (TMPE), 3,4,5-trimethoxyphenylacetaldehyde (TMPA), N-acetylmescaline, mescaline, or saline. Both aldehyde dehydrogenase and amine oxidase inhibitors enhanced the effects of mescaline, while TMPE, TMPA, and N-acetylmescaline failed to exhibit generalization to the mescaline state, regardless of pretreatment. Findings do not indicate the role of a metabolite in the interoceptive cue produced by mescaline. (39 ref)—*Journal abstract.*

11160. Calhoun, William H. & Jones, Elisabeth A. (U Tennessee, Knoxville) **Methamphetamine's effect on tenneased acquisitions with serial discrimination reversals.** *Psychopharmacologia*, 1974, Vol 39(4), 303-308.—In 2 experiments a total of 8 male Sprague-Dawley rats were trained through a series of discrimination reversals until they developed a stable, repeated acquisition baseline. Intraperitoneal methamphetamine (.5 mg/kg) accelerated acquisition measured from this baseline. The drug effect was demonstrated with successive cumulative records and with a graphic method using a distribution of error scores to develop a baseline. Generally, with low doses (.25-.50), methamphetamine reduced errors without affecting rewarded responding. This effect is dose dependent, although at 1.0 mg/kg the drug may disrupt operant behavior. —*Journal abstract.*

11161. Carter, Gregg L. (Columbia U) **Effects of cigarette smoking on learning.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1344-1346.—Although there

was a difference between 10 smoking and 10 nonsmoking Ss on the number correct on a letter-digit substitution task for the 2nd of 2 10-trial blocks given in the 1st of 2 sessions (7 days apart), there was no difference in savings (number of trials) for serial learning.

11162. Chesher, G. B. & Jackson, D. M. (U Sydney, NSW, Australia) **The effect of withdrawal from cannabis on pentylenetetrazol convulsive threshold in mice.** *Psychopharmacologia*, 1974, Vol 40(2), 129-135.—Groups of male QS strain mice were dosed with ethanol (2.5 and 5% w/v in drinking water) or cannabis extract (equivalent to 10, 20, 40 and 80 mg/kg  $\Delta^9$ -tetrahydrocannabinol) orally for 11, 13, and 28 days. The threshold to convulsions produced by the constant intravenous infusion of pentylenetetrazol was determined at various intervals after drug administration had ceased. The convulsive thresholds of Ss tested 6 hrs after withdrawal from both doses of ethanol were significantly lower than controls. There was no significant difference from controls in the convulsive threshold of Ss which had received cannabis extract at any of the doses employed when tested 6 hrs, 16 hrs, 1, 3, or 6 days after medication had been withdrawn. Findings support the contention that there is no abstinence syndrome evident following the withdrawal of cannabinoids after prolonged administration to mice and serve again to draw a distinction between cannabis and ethanol.—*Journal abstract*.

11163. Clemens, James A.; Smalstig, E. Barry & Sawyer, Barry D. (Eli Lilly & Co., Research Lab, Indianapolis, IN) **Antipsychotic drugs stimulate prolactin release.** *Psychopharmacologia*, 1974, Vol 40(2), 123-127.—Conducted a study with a total of 182 male and 34 female Sprague-Dawley rats. Intraperitoneal doses of antipsychotic drugs markedly stimulated prolactin secretion in male and female Ss. The amount of prolactin released was greater in females than in males. Most nonantipsychotic phenothiazines failed to alter prolactin. Results imply that the dopamine receptor that inhibits prolactin release may be similar to the dopamine receptor involved in the action of antipsychotic drugs. (18 ref)—*Journal abstract*.

11164. Cohen, Gerald; MacNamee, Dana & Dembiec, Dorothy. (Mt Sinai School of Medicine, City U New York) **Elevation in blood acetaldehyde by pargyline during ethanol administration.** *Biochemical Pharmacology*, 1975(Jan), Vol 24(2), 313-316.—Experimental results show that pargyline, a monoamine oxidase inhibitor, markedly elevated blood acetaldehyde levels in ethanol-intoxicated mice and rats. It is suggested that this elevation could be a source of concern or an experimental tool for investigators studying behavioral or pharmacologic aspects of the interaction of catecholamines with ethanol and acetaldehyde.

11165. Corcoran, Michael E.; Bolotow, Igor; Amit, Zalman & McCaughan, James A. (U British Columbia, Kinsmen Lab of Neurological Research, Vancouver, Canada) **Conditioned taste aversions produced by active and inactive cannabinoids.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 725-728.—In an experiment with 228 male Wistar rats, single intraperitoneal injections of subtoxic doses of  $\Delta^9$ -tetrahydrocannabinol (THC),  $\Delta^9$ -THC, cannabidiol (CBD), or cannabigerol (CBG) induced a conditioned aversion to a

saccharin solution, while only a behaviorally toxic dose of cannabichromene (CBC) was capable of motivating an aversion. In view of evidence suggesting that the taste aversions were not due to local irritation effects, it is concluded that CBD and CBG are pharmacologically active in rats and could be responsible for some of the behavioral effects of cannabis in animal studies. (24 ref)—*Journal abstract*.

11166. Crow, Lowell T. & Edelbrock, Craig. (Western Washington State Coll) **Stimulus properties of sympathomimetic and sympatholytic drugs.** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 575-577.—Trained 37 male Holtzman albino rats in a shuttlebox avoidance task under 1 of 3 drug conditions: epinephrine suspension (Sus-Phrine), dihydroergotamine mesylate (DHE-45), or placebo. 24 hrs later the animals were tested for retention in the same or a different drug state. No evidence was found for a drug sequence effect although the DHE-45 group exhibited significantly more avoidances. An operant conditioning procedure yielded results supporting discriminative stimulus properties of DHE-45. Results are discussed as they relate to the discriminative control of behavior through stimuli of an autonomic character.—*Journal abstract*.

11167. Davis, Michael & Sheard, Michael H. (Yale U, Medical School) **Biphasic dose-response effects of N-N-dimethyltryptamine on the rat startle reflex.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 827-829.—Measured the startle reflex in 4 groups of 10 male Sprague-Dawley albino rats each after intraperitoneal injection of saline or .12, .25, .50 or 4.0 mg/kg N-N-dimethyltryptamine (DMT). Low doses (.25 and .50) of DMT augmented startle, but the high dose (4.0) depressed startle. This biphasic dose-response relationship is consistent with the hypothesis that startle is enhanced when midbrain raphe neurons are inhibited but depressed when cells postsynaptic to raphe neurons are also inhibited.—*Journal abstract*.

11168. Davis, W. M. et al. (U Mississippi, School of Pharmacy) **Motility of mice after amphetamine: Effects of strain, aggregation and illumination.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 803-809.—Tests of locomotor activity in male C57B1/6Cum, DBA/2Cum, C3H/AnCum, CBA/Cum, BALB/cCum, and Swiss-Webster mice indicated that the BALB/c strain ranked lowest and the C57B1/6 strain ranked highest in locomotor excitation after intraperitoneal injection of dextroamphetamine. A further study comparing only the BALB/c and C57B1/10 strains again showed a significant interaction of drug and strain effects. Additional significant determinants of motility were lighting and social condition during test (1 or 4 Ss). Lighting (dark, dim, and full light) also interacted significantly with drug, strain, and grouping effects. Whereas the C56B1/10 Ss showed higher levels of motility, the BALB/c showed the greater absolute increases in motility following amphetamine. The BALB/c strain also showed greater lethality under aggregated conditions (group of 10 Ss) in the dose range used for activity studies. (24 ref)—*Journal abstract*.

11169. Davis, W. Marvin & Smith, Stanley G. (U Mississippi, School of Pharmacy) **Central cholinergic influence on self-administration of morphine and**

**amphetamine.** *Life Sciences*, 1975(Jan), Vol 16(2), 237-246.—In 3 experiments, atropine and methylatropine were tested in a total of 94 male Wistar rats for an ability to alter the reinforcing action of intravenous morphine sulfate and dextroamphetamine sulfate (60  $\mu$ g/kg/injection). Atropine blocked the self-administration of morphine, but methylatropine did not. Similarly, atropine but not methylatropine prevented the establishment of a conditioned reinforcer based on passive intravenous infusions of morphine. Self-administration of dextroamphetamine was enhanced by atropine but not by methylatropine. Results indicate that a central cholinergic system exerts an influence on the brain mechanisms which are affected by morphine or dextroamphetamine to produce positive reinforcement. (24 ref)—*Journal abstract*.

11170. Dörner, Günter et al. (Humboldt U, Inst of Experimental Endocrinology, Berlin, E Germany) **A neuroendocrine predisposition for homosexuality in men.** *Archives of Sexual Behavior*, 1975(Jan), Vol 4(1), 1-8.—In male rats, androgen deficiency during a critical hypothalamic organizational period has been shown to give rise to a predominantly female-differentiated brain, homosexual behavior, and demonstration of a positive estrogen feedback effect. In the present study, a positive estrogen feedback effect was also induced in intact homosexual men, in contrast to intact heterosexual and bisexual men. In 21 homosexual men an intravenous injection of 20 mg presomen (Premarin) produced a significant decrease of serum luteinizing hormone (LH) levels followed by an increase above initial LH values. In 20 heterosexual and in 5 bisexual men, intravenous estrogen administration, while producing a significant decrease of the serum LH level, was not followed by an increase above the initial LH values. Using a radioimmunoassay, plasma testosterone levels and 24-hr urinary excretions of unconjugated testosterone of adult homosexual men were in the normal range as observed in heterosexual men. This finding suggests that homosexual men possess a predominantly female-differentiated brain which may be activated to homosexual behavior by normal or approximately normal androgen levels in adulthood. (25 ref)—*Journal abstract*.

11171. Dykstra, L. A.; McMillan, D. E. & Harris, L. S. (U North Carolina, Chapel Hill) **Effects of  $\Delta^9$ -THC and a water soluble ester of  $\Delta^9$ -THC on schedule-controlled behavior.** *Pharmacology, Biochemistry & Behavior*, 1975(Jan-Feb), Vol 3(1), 29-32.— $\Delta^9$ -Tetrahydrocannabinol ( $\Delta^9$ -THC) and one of its water soluble esters (SP-111) decreased the rates of responding by 12 male White Carneaux pigeons working under a variable interval 3-min schedule of food presentation, or a multiple fixed-ratio 30, fixed-interval 5-min schedule of food presentation.  $\Delta^9$ -THC was 3-6 times more potent than SP-111 and had a faster onset of effects on behavior.—*Journal abstract*.

11172. Elias, Merrill F. & Eleftheriou, Basil E. (Syracuse U) **A behavior-genetic investigation of induction and education times for halothane anesthesia.** *Behavior Research Methods & Instrumentation*, 1975(Jan), Vol 7(1), 7-10.—Measured induction and recovery (education) times for recombinant inbred strains (RI strains) of mice, their reciprocal F<sub>1</sub> hybrids, and their

progenitor strains. The resulting pattern of means for these groups indicated that 2 or more loci influence induction and education times. The strain distribution patterns were different for induction and education and for different dose levels of anesthetic. It is suggested that strain differences in time to induce anesthetic effects and time to recover from anesthetic effects, as well as inadvertent use of varying anesthetic dose levels from study to study, may contribute to inconsistent results for studies of anesthetic effects on complex behavior.—*Journal abstract*.

11173. Ellis, Fred W. & Pick, James R. (U North Carolina, Medical School, Chapel Hill) **Experimental studies of alcohol dependence in animal models.** In *Selected papers delivered at The Ninth Annual West Virginia School on Alcohol and Drug Abuse Studies*, June 17-22, 1973. Morgantown, WV: West Virginia University, 1973. 165 p.

11174. Ellison, Gaylord; Handel, Judi; Rogers, Richard & Weiss, Judy. (U California, Los Angeles) **Tricyclic antidepressants: Effects on extinction and fear learning.** *Pharmacology, Biochemistry & Behavior*, 1975(Jan-Feb), Vol 3(1), 7-11.—48 female albino rats trained to run an alley for a food reward were extinguished following injections of different antidepressants. When retested several days later, Ss extinguished following pretreatment with protriptyline showed faster running speeds than did the other groups. In a 2nd experiment with 84 female hooded rats, Ss given electrical shocks following pretreatment with protriptyline avoided the compartment in which they had been shocked less than did Ss shocked following pretreatment with other antidepressants. This implies an interference with some aspect of the learning or consolidation process which is correlated with the degree of norepinephrine (NE) reuptake blockage. It is hypothesized that NE terminals are deactivated following frustrative nonreward or punishment by the conversion and reuptake of the released NE to an altered extinction molecule. (34 ref)—*Journal abstract*.

11175. Fechter, Laurence D. (Johns Hopkins U) **The effects of L-dopa, clonidine, and apomorphine on the acoustic startle reaction in rats.** *Psychopharmacologia*, 1974, Vol 39(4), 331-344.—Conducted a series of within-S experiments with male Holtzman albino rats which demonstrated that an amine-depleting dose of reserpine enhanced the level of the startle reaction and that this effect was reversed by the catecholamine precursor, levodopa. Chemical assays suggested a correlation between the accumulation of noradrenaline and reversal of reserpine effects. Administration of the noradrenaline receptor-stimulating agent, clonidine (.125 or .250 mg/kg), produced marked reductions in startle amplitude reducing the response far below normal values in reserpinized Ss. By contrast, the dopamine receptor-stimulating agent, apomorphine (1.0 mg/kg) did not alter the response. None of the pharmacological agents used altered the inhibition of the startle reaction which resulted from the presentation of neutral stimuli (pulses) shortly before reflex elicitation. Taken together with an earlier report, the present data suggest that noradrenaline and serotonin have partially antagonistic

control over the startle reaction. (16 ref)—*Journal abstract*.

11176. Flexner, Josefa B. & Flexner, Louis B. (U Pennsylvania, Medical School) **Puromycin's suppression of memory in mice as affected by caffeine.** *Pharmacology, Biochemistry & Behavior*, 1975(Jan-Feb), Vol 3(1), 13-17.—Investigated the previous finding that expression of maze-learning in mice is blocked for long periods of time by puromycin injected intracerebrally 1 or more days after the training experience. In the present study with male and female Swiss-Webster mice, treatment with caffeine after training was found to reduce greatly the amnesic effects of puromycin. With a high dose of caffeine (200 mg/kg) this reduction was evident 6 days after treatment with puromycin. With a lower dose of caffeine (25 mg/kg) the effect became evident only after a more extended period of time. In view of control experiments, it is suggested that caffeine modifies factors necessary for the expression of memory and that this alteration makes puromycin relatively ineffective in blocking memory. (31 ref)—*Journal abstract*.

11177. Fontaine, O.; Libon, Ph. & Richelle, M. (U Liège, Belgium) **Action of a new psychotropic drug (sulpiride) on avoidance behavior in rats.** *Psychopharmacologia*, 1974, Vol 39(4), 309-314.—Sulpiride, a psychotropic drug with neuroleptic activity, was administered to 5 Wistar albino rats in a Sidman avoidance schedule. Doses ranging from 1 to 80 mg/kg resulted in the S receiving fewer shocks. This effect was not correlated with an increase of responding and seemed unrelated to the suppressing action abruptly observed at high doses (150-200 mg/kg). Results differ from those classically obtained with other neuroleptics.—*Journal abstract*.

11178. Franken, Robert E. & Strain, Allan. (U Calgary, Alberta, Canada) **Effect of increased arousal on response to stimulus change in a complex maze.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1076-1078.—Tested 24 male and 24 female hooded rats under methamphetamine or saline in a 6-choice-point multiple-T maze. On Trial 1, the Ss were exposed to a homogeneous black or white maze. Between daily Trials 1 and 2 the maze was (a) left unchanged, (b) the culs were changed from Black (B) to White (W) or W to B, or (c) the path was changed from B to W or W to B. Methamphetamine-treated Ss made fewer approach responses to change when the change occurred in the culs and spent less time running from one end of the maze to the other. It is concluded that methamphetamine reduces the invitational properties normally associated with change or novelty.—*Journal abstract*.

11179. Gay, Patricia E.; Leaf, Russell C. & Arble, Francine B. (Rutgers State U) **Inhibitory effects of pre- and posttest drugs on mouse-killing by rats.** *Pharmacology, Biochemistry & Behavior*, 1975(Jan-Feb), Vol 3(1), 33-45.—In a series of 6 experiments with a total of 150 male Holtzman rats, mouse-killing was gradually inhibited by repeated posttest injections of dextroamphetamine (1.5 mg/kg), levoamphetamine (1.5 mg/kg), or pilocarpine (7.5 mg/kg), but not by control substances. Of these drugs, only dextroamphetamine inhibited killing when given prior to a mouse-killing test. Further experiments suggest that anorexia per se did not contribute to drug-induced inhibitory effects but that changes in internal

state were important to the development of inhibition. Pretest injections appear to inhibit predatory killing by a direct pharmacological action on some target site or sites, while posttest injections produce a learned aversion to predatory killing. (44 ref)—*Journal abstract*.

11180. Gérardy, J. & Dresse, A. (U Liège, Lab de Pharmacologie, Belgium) **Action of neuroleptics on the content of dopamine and of DOPAC in the rat caudate nucleus.** [Fren] *Experientia*, 1974, Vol 30(5), 523-524.—Studied the action of 5 neuroleptics and of a sedative drug on the content of dopamine and of DOPAC (3,4-Dihydroxyphenylacetic acid) in the rat caudate nucleus. The neuroleptics haloperidol, pimozide, chlorpromazine, and levomepromazine increased the amount of DOPAC significantly, while the dopamine itself remained unchanged. Reserpine significantly decreased dopamine but also weakly decreased the DOPAC level. Promethazine had no effect on the level of either. A seasonal variation of the dopamine content also was observed. The duration of the neuroleptic action on DOPAC parallels self-stimulation behavior. A presynaptic action of these drugs may be implied in the DOPAC increase.—*English summary*.

11181. Gold, Paul E. & Van Buskirk, Roderick B. (U California, School of Biological Sciences, Irvine) **Facilitation of time-dependent memory processes with posttrial epinephrine injections.** *Behavioral Biology*, 1975(Feb), Vol 13(2), 145-153.—2 experiments used a total of 175 male Sprague-Dawley rats to examine the effect of posttraining epinephrine injections on memory-storage processes. Ss were trained with a weak footshock on a 1-trial inhibitory avoidance task. Ss received subcutaneous epinephrine injections immediately, 10 min, 30 min, or 2 hrs after training. On a retention test 24 hrs after training, Ss which received epinephrine (.01, .05, or .1 mg/kg) immediately after training had retention performance which was significantly better than that of saline controls. A lower (.001 mg/kg) or a higher (.5 mg/kg) dose did not affect retention performance. Epinephrine injections (.1 mg/kg) given 10 min after training also significantly facilitated retention, but injections given 30 min or 2 hrs after training did not. Findings suggest that the hormonal consequences of a training experience may normally modulate memory-storage processes in untreated animals. (25 ref)—*Journal abstract*.

11182. Goodlet, Ian & Sugrue, Michael F. (Organon Scientific Development Group, Newhouse, Scotland) **Effect of acutely administered analgesic drugs on rat brain serotonin turnover.** *European Journal of Pharmacology*, 1974(Dec), Vol 29(2), 241-248.—Results of a series of experiments reveal that pentazocine, methadone, and pethidine do not share the ability possessed by acutely administered morphine to increase rat brain 5-hydroxytryptamine (serotonin) turnover. (31 ref)

11183. Gutwein, Baruch M.; Quartermain, David & McEwen, Bruce S. (City Coll, City U New York) **McEwen, Bruce S. (City Coll, City U New York) Dissociation of cycloheximide's effects on activity from its effects on memory.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 753-756.—Conducted 4 experiments with male C57BL/6J mice in which 2 subcutaneous doses of cycloheximide (CYC) were used to dissociate the effect of this drug on locomotor activity

from its effect on memory. Results indicate that significant short-term (30' - 40') and long-term (24-hr) increases in locomotor activity occurred at both CYC doses, whereas significant short- and long-term decreases in step-out latencies in a passive-avoidance task occurred primarily at the higher CYC dose. Pargyline, a monoamine oxidase inhibitor, significantly increased locomotor activity but did not decrease step-out latencies in the passive-avoidance task. It is concluded that the decreases in step-out latencies shown by CYC-treated Ss in the passive avoidance task are the result of an amnesic effect of CYC rather than its effect on locomotor activity. —*Journal abstract.*

11184. **Harding, T.** (Royal Edinburgh Hosp, Scotland) **The effect of lysergic acid di-ethylamide on serum creatine kinase levels.** *Psychopharmacologia*, 1974, Vol 40(2), 177-184.—Estimated serum creatine kinase levels in 7 patients following LSD ingestion during the 24 hrs preceding admittance to a psychiatric hospital. All patients showed a transient rise in serum level, greatest in those who became psychotic.

11185. **Heikkilä, Richard E.; Cohen, Gerald & Manian, Albert A.** (Mt Sinai School of Medicine, City U New York) **Reactivity of various phenothiazine derivatives with oxygen and oxygen radicals.** *Biochemical Pharmacology*, 1975(Feb), Vol 24(3), 363-368.—Results of chemical tests show that orthodihydroxylated phenothiazine derivatives react with oxygen to form the very reactive and potentially toxic chemical species, hydrogen peroxide and superoxide and hydroxyl radicals, and react also with the hydroxyl radical. It is suggested that these properties may be responsible for some of the beneficial and/or adverse effects of administered phenothiazines. (26 ref)

11186. **Heiss, W.-D. & Hoyer, J.** (Inst für allgemeine und vergleichende Physiologie, Vienna, Austria) **Dopamine receptor blockade by neuroleptic drugs in *Aplysia* neurones.** *Experientia*, 1974, Vol 30(11), 1318-1320.—Investigated dopamine receptor blockage by neuroleptic (antipsychotic) drugs in the marine mollusc *Aplysia californica*. Intact abdominal ganglion were isolated, selected neurons were penetrated with microelectrodes, and haloperidol and fluphenazine were directly added. Addition of both drugs resulted in a qualitative decrease or blockage of the dopamine response. Results indicate that the effects of dopamine are mediated by 2 distinct receptors. The reversible, probably competitive, blocking effect on both receptors suggests that the receptors are structurally similar. (German summary)—*R. Tomasko.*

11187. **Hine, B.; Friedman, E.; Torrelío, M. & Gershon, S.** (New York U, Medical School, Neuropsychopharmacology Research Unit) **Morphine-dependent rats: Blockade of precipitated abstinence by tetrahydrocannabinol.** *Science*, 1975(Feb), Vol 187(4175), 443-445.—Groups of 7 male Sprague-Dawley rats were implanted subcutaneously with a pellet containing 75 mg of morphine base or placebo, and naloxone hydrochloride (4 mg/kg of body weight) was administered 72 hrs later. Treatment with  $\Delta^9$ -tetrahydrocannabinol (THC, 2, 5, or 10 mg/kg) 1 hr before naloxone administration significantly reduced the intensity of abstinence; the 2 higher doses blocked the appearance of wet shakes and escapes, diarrhea, and increased defecation. THC did not induce

abstinence itself, and prior treatment with cannabidiol was ineffective in reducing naloxone-precipitated abstinence in Ss with morphine pellets. Data suggest that THC may be of value in facilitating narcotic detoxification.—*Journal abstract.*

11188. **Hirschhorn, I. D. & Rosecrans, J. A.** (Medical Coll Virginia, Richmond) **Studies on the time course and the effect of cholinergic and adrenergic receptor blockers on the stimulus effect of nicotine.** *Psychopharmacologia*, 1974, Vol 40(2), 109-121.—Conducted a study with male Sprague-Dawley rats to determine the time course of the nicotine stimulus and its relationship to brain levels of the drug and to determine whether the nicotine stimulus is dependent upon the integrity of specific neurotransmitter systems. A lever choice discrimination was used. After subcutaneous injection of nicotine, depression of 1 lever resulted in food reinforcement. When saline was administered, the opposite lever was reinforced. A high degree of discriminated responding was observed when either 400 or 200  $\mu$ g/kg of nicotine was used as a discriminative stimulus. The degree of discrimination decreased as the length of the time period between the injection of nicotine and the test of discrimination was increased. This decline in discrimination was similar to the decline in brain levels of nicotine, suggesting that nicotine discrimination is directly related to the concentration of nicotine in the brain. Atropine, mecamylamine, dibenamine, propranolol, and  $\alpha$ -methyl-para-tyrosine were all tested for effects upon nicotine discrimination. Of these, only mecamylamine antagonized the nicotine stimulus. Results indicate that the stimulus effect of nicotine is mediated specifically through nicotinic-cholinergic receptors and not muscarinic-cholinergic or adrenergic receptors. (19 ref)—*Journal abstract.*

11189. **Ho, A. K. et al.** (Wayne State U, Coll of Pharmacy & Allied Health Professions) **Experimental studies on alcoholism: I. Increased in alcohol preference by 5,6-dihydroxytryptamine and brain acetylcholine.** *Psychopharmacologia*, 1974, Vol 40(2), 101-107.—Studied the effects of an intracisternal injection of 75  $\mu$ g of 5,6-dihydroxytryptamine (DHT) on alcohol preference in male Sprague-Dawley rats. Results indicate that alcohol consumption was increased significantly from about the 5th to 11th days after treatment. This DHT-induced alcohol preference was antagonized by 4-(1-naphthylvinyl) pyridine, an inhibitor of choline acetyltransferase. The level of brain acetylcholine was also increased significantly ( $p < .001$ ) 8 days after DHT treatment. It is suggested that the DHT-induced alcohol preference may be attributed to an increase in central cholinergic activities. The possibility of a modulation of 5-hydroxytryptamine on cholinergic activity is discussed. (16 ref)—*Journal abstract.*

11190. **Irvin, Jean E. & Mellors, Alan.** (U Guelph, Ontario, Canada)  **$\Delta^9$ -tetrahydrocannabinol: Uptake by rat liver lysosomes.** *Biochemical Pharmacology*, 1975(Jan), Vol 24(2), 305-307.—Presents experimental observations in rats which may explain some of the clinical evidence that chronic marihuana use leads to hepatotoxicity and cirrhosis. Damage to lysosomes by cannabinoids may also be the basis of the reduced cellular immunity seen in chronic users of marihuana

and hashish, since cellular immunity is mediated in part through lysosomal involvement in the immune response.

11191. Japan-United States Co-operation on Drug Abuse Research, 1969-1972. Research on cannabis (marihuana). *Bulletin on Narcotics*, 1973(Jul-Sep), Vol 25(3), 37-48.—Lists participating researchers in both countries and provides information on chemical, biochemical, pharmacological, and clinical studies of  $\Delta^9$ -tetrahydrocannabinol. Needed research in each of these fields is specified.

11192. Järbe, Torbjörn U. & Henriksson, Bengt G. (Uppsala, Sweden) Discriminative response control produced with hashish, tetrahydrocannabinols ( $\Delta^9$ -THC and  $\Delta^8$ -THC), and other drugs. *Psychopharmacologia*, 1974, Vol 40(1), 1-16.—Conducted a series of experiments with a total of 100 male Sprague-Dawley albino rats to examine the discriminative properties of hashish and its derivatives and other, noncannabinoid drugs. To determine the specificity of the drug-induced response control, a variety of psychotropic drugs were tested for their possible generalization to the training drugs. It is concluded that tetrahydrocannabinols ( $\Delta^9$ - and  $\Delta^8$ -THC) were interchangeable with respect to cue function and that hashish, inhaled as smoke, produced cue effects similar to synthetic THC. Neither cannabidiol nor cannabinol evidenced transfer to hashish or its derivatives. Lack of generalization to THC was also apparent for central nervous system (CNS) depressants, anticholinergics, tacrine, sernylan, psilocybine, morphine, CNS stimulants, yohimbine, and phenitron. Except for atropine (150.0 mg/kg), the transfer testings for the noncannabinoid drugs yielded results that were anticipated from previous literature. Chlordiazepoxide showed transfer to diazepam. Results from transfer testings in rats required to differentiate one drug state from another drug-induced state, give additional support to the previous conclusions. (3 p ref)—*Journal abstract*.

11193. Johansson, J. O.; Järbe, T. U. & Henriksson, B. G. (Uppsala, Sweden) Physostigmine attenuation of  $\Delta^9$ -tetrahydrocannabinol induced hyperthermia in rats. *Experientia*, 1974, Vol 30(7), 779-780.—Hyperthermia is shown to be caused by both morphine and  $\Delta^9$ -tetrahydrocannabinol and to be counteracted in both cases by physostigmine. (German summary)

11194. Julien, R. M. & Kavan, Eva M. (U California, Coll of Medicine, Irvine) Electrophysiological effects of etoxadrol (CL-1848C): A new intravenous anaesthetic agent. *Neuropharmacology*, 1975(Jan), Vol 14(1), 53-59.—Etoxadrol and ketamine, although structurally dissimilar, both induce similar states of anesthesia. In a total of 21 cats with chronically implanted electrodes, etoxadrol-induced anesthesia was characterized by a progressive increase in central nervous system excitability with high voltage hypersynchrony and spikes occurring at intravenous doses of 5-10 mg/kg and convulsions at doses of 15-25 mg/kg. Complete recovery occurred within 24 hrs. With anesthetic doses of etoxadrol, only minimal alterations in evoked cortical and subcortical potentials were observed. Comparison was made between the electrophysiological alterations induced by etoxadrol and those induced by other anesthetics. Some anesthetics depressed evoked cortical and subcortical potentials (ether, halothane, and barbiturates) while others exerted

no change (althesin, isoflurane, ketamine and etoxadrol) or augmented (enflurane) the same potentials. The limitations to the evaluation of evoked potentials in the determination of a drug's anesthetic properties is discussed. (18 ref)—*Journal abstract*.

11195. Karkishchenko, N. N. (Rostov State U, Medical Inst, USSR) [The role of monoamines in the systemic activity of the brain.] (Russ) *Farmakologiya i Toksikologiya*, 1974(Jul-Aug), Vol 37(4), 403-407.—Carried out 107 experiments on 32 rabbits and 11 cats, with electrodes implanted in various brain structures. The action of endogenous catecholamines, acetylcholine, and serotonin, produced by the introduction of the relevant substances, was then studied. The substances changed the excitability of many of the brain structures in a complex differential fashion. (English summary)—A. G. Pook.

11196. Klemm, W. R. (Texas A&M U) Dissociation of EEG and behavioural effects of ethanol provide evidence for a noncholinergic basis of intoxication. *Nature*, 1974(Sep), Vol 251(5472), 234-236.—Studied the action of physostigmine in blocking ethanol-induced EEG deactivation in 8 rats. The EEG and a battery of behavioral tests were used to obtain specific measures of ethanol action. It was found that physostigmine blocked EEG deactivation but did not prevent behavioral effects of ethanol. The most significant aspect of the ethanol dissociation is the suggestion that intoxication does not primarily involve impairment of cholinergic systems. The behavioral tests included 4 standard "catalepsy" tests and confirmed behavioral intoxication when ethanol-physostigmine was injected intraperitoneally. Findings agree with a recent report that acetylcholine action is suppressed by ethanol. (28 ref)—A. de la Haba.

11197. Lal, Harbans; Colpaert, Francis C. & Laduron, Pierre. (U Rhode Island) Narcotic withdrawal like mouse jumping produced by amphetamine and L-DOPA. *European Journal of Pharmacology*, 1975(Jan), Vol 30(1), 113-116.—Conducted studies with 76 experimental and 24 control male Swiss albino mice in which upward jumping in Ss that resembled the narcotic-withdrawal syndrome was produced by a combination of intraperitoneal amphetamine (4 mg/kg) and levodopa (400 mg/kg) administration. Neither drug alone caused that jumping. Pretreatment with haloperidol (.16 mg/kg) or pimozide (.08 mg/kg) but not with phentolamine (10 mg/kg)—all given subcutaneously—effectively blocked amphetamine-levodopa jumping. After levodopa there was an increase in the brain levels of levodopa, dopamine, and norepinephrine. Amphetamine, ineffective in itself, enhanced levodopa-induced elevation of brain levodopa and dopamine without affecting brain norepinephrine levels.—*Journal abstract*.

11198. Lapin, I. P.; Oksenkru, G. F.; Osipova, S. V. & Uskova, N. V. (Bektereva Psychoneurological Inst, Leningrad, USSR) [Potentiation with tricyclic antidepressants of the inhibitory action of apomorphine on the righting reflex in frogs.] (Russ) *Farmakologiya i Toksikologiya*, 1974(Jul-Aug), Vol 37(4), 407-410.—Carried out experiments during the winter on frogs (*Rana temporaria*) caught in the wild and kept in groups of 6-8 Ss. A range of tricyclic antidepressants were administered 30 min before a dose of apomorphine. After

intervals of 1, 2, 3, and 4 hrs the uprighting reflex of the Ss was tested 10 times in succession. Inability to turn upright in 30 sec was regarded as a negative response. Apomorphine was found to weaken the uprighting reflex. Tricyclic antidepressants (chlorimipramine, imipramine, amitriptyline, demethylimipramine, and nortriptyline) potentiated this effect. Tertiary antidepressants had a more marked effect than secondary derivatives. Neuroleptics (haloperidol and thioproperazine) had no effect on the potentiating of the apomorphine response by imipramine. (English summary) (15 ref)—*A. G. Pook*.

role and importance of clinical psychologists in the field of neuropsychopharmacological research and experimentation. The numerous psychological methods and statistical procedures are surveyed. (English summary) (20 ref)

11204. **Marcy, R. & Quermone, M. A.** (U Caen, France) **Anhydrotic effect of benzodiazepines in mice.** *Experientia*, 1974, Vol 30(7), 783-784.—Studied the inhibitory effect of benzodiazepines on palmar sweating in groups of 10 Swiss mice. Palmar skin conductivity was inhibited, secondary to inhibition of sweating. Doses resulting in 50% inhibition of conductivity are reported for 8 drugs. (French summary)

11205. **McKim, W. A.** (Memorial U Newfoundland, St John's, Canada) **The effects of scopolamine and physostigmine on fixed-interval behaviour in the rat.** *Psychopharmacologia*, 1974, Vol 39(3), 237-244.—Conducted 2 experiments with a total of 5 Long-Evans and 8 Wistar albino male rats to determine whether scopolamine and physostigmine, which have opposite effects on cholinergic transmission, also produce opposite effects on fixed-interval (FI) performance. Scopolamine and a wide range of doses of physostigmine were administered intraperitoneally singly and concurrently to Ss responding on a FI 2-min schedule. Scopolamine produced a disruption in FI curvature which could be antagonized by physostigmine, but physostigmine by itself produced no consistent change. (15 ref)—*Journal abstract*.

11206. **Miczek, Klaus A.** (Carnegie-Mellon U) **Intraspecies aggression in rats: Effects of d-amphetamine and chlordiazepoxide.** *Psychopharmacologia*, 1974, Vol 39(4), 275-301.—Dextroamphetamine sulfate and chlordiazepoxide hydrochloride, administered to either the dominant or subordinate rat, altered several components of fighting behavior in a dose-dependent biphasic manner. Stereotypic sequences of attack, threat, defense, and submission were generated between pairs of previously isolated Sprague-Dawley rats by extinction of a food-reinforced response. Low doses of amphetamine (.05, .1 mg/kg) and chlordiazepoxide (2.5, 5.0 mg/kg) given intramuscularly to the dominant S 30 min prior to 15-min tests increased attack bites and leaps and the display of aggressive postures and threats, whereas higher doses of both drugs (.5, 1.0 mg/kg amphetamine; 20 mg/kg chlordiazepoxide) suppressed attacks and threats. Amphetamine and chlordiazepoxide, administered to the subordinate S, caused a more prolonged display of submissive-supine and defensive-upright postures. Drugged subordinate Ss also provoked more attacks and threats by the nondrugged opponents. The multiresponse analysis of fighting revealed that various elements of aggressive and defensive-submissive behavior patterns are differentially sensitive to drug action. Results indicate that amphetamine and chlordiazepoxide can facilitate or inhibit attack or defense, depending on the dose level and which of the opponents was injected, but do not reverse dominance-subordination relationships. (3 p ref)—*Journal abstract*.

11207. **Monti, Jaime M. & Velluti, Ricardo.** (Hosp de Clinicas, Facultad de Medicina, Montevideo, Uruguay) **Action of psychotropic drugs upon pO<sub>2</sub> in the lateral amygdala and pontine reticular formation during the sleep-wakefulness cycle.** *Pharmacology, Biochemistry &*

*Behavior*, 1974(Nov-Dec), Vol 2(6), 763-767.—Studied the actions of intraperitoneal nitrazepam, haloperidol, and pentobarbital upon oxygen pressure ( $pO_2$ ) of nuclei amygdalae lateralis and reticularis pontis caudalis during the sleep-wakefulness cycle in 5 cats with chronically implanted oxygen cathodes. Nitrazepam at the .25 mg/kg dose selectively diminished the  $pO_2$  oscillations in the lateral amygdala. Further, phasic changes depicted during REM sleep in the pontine reticular formation were abolished. After larger doses (.5-1.0 mg/kg) there was a simultaneous and progressive decrease of the current oscillations in both structures. Haloperidol produced a reduction of  $pO_2$  current waves only after the highest administered dose (2.0 mg/kg), without specificity for any of the structures recorded. Sedative and anesthetic doses of pentobarbital also decreased  $pO_2$ -wave amplitude in a dose-response related manner. (22 ref)—*Journal abstract*.

11208. Moskowitz, Herbert & McGlothlin, William. (U California, Los Angeles) **Effects of marihuana on auditory signal detection.** *Psychopharmacologia*, 1974, Vol 40(2), 137-145.—Tested 23 paid, male college students for auditory signal detection under a no-treatment condition, and smoke-marihuana conditions containing 0, 50, 100, and 200  $\mu$ g/kg  $\Delta^9$ -tetrahydrocannabinol. Signal detection was measured under conditions of concentrated attention, in which the S reported the presence or absence of a tone in a 3-sec noise burst; and divided attention, where the S also repeated a series of 6 digits which were presented simultaneously with the noise burst. No differences were found between the no-treatment and placebo conditions. Significant dose-dependent impairment of signal detection resulted for the marihuana conditions under both concentrated and divided attention. Application of signal detection theory indicates that impaired performance was due to a decline in sensitivity ( $d'$ ), independent of changes in S criteria ( $\beta$ ). There was also some indication of change in criteria—a greater tendency for erroneous reporting of a signal when it was not present.—*Journal abstract*.

11209. National Clearinghouse for Drug Abuse Information. (Rockville, MD) **Narcotic antagonists.** *National Clearinghouse for Drug Abuse Information, Report Series*, 1973(Oct), Series 26(1), 15 p.—Describes the history, chemistry, pharmacology, and clinical effects of narcotic antagonists. These drugs often produce analgesia without the more undesirable actions of morphine, and are showing promise in the management of heroin addiction. Articles are reviewed which show the dangers and benefits of narcotic antagonists. (41 ref)—G. E. Zimmerman.

11210. Nurmand, L. B. (Tartu State U, Estonian SSR) **[Changes in the activity of some substances potentiating anesthesia against the background of developing tolerance of sodium barbital.]** (Russ) *Farmakologiya i Toksikologiya*, 1974(Jul-Aug), Vol 37(4), 401-403.—Studied the effects of spasmolytin (100 mg/kg introduced intraperitoneally), chlorpromazine, and estocin (5 mg/kg and 25 mg/kg respectively, both introduced subcutaneously) on anesthesia induced by sodium barbital (100 mg/kg, intraperitoneally) in 25 male mice, using the lateral position test. The substances were introduced either 20 min before the sodium barbital or

immediately after the S started to awaken, in the 1st or 2nd day of the study, according to whether the S was tolerant or intolerant. A single introduction of sodium barbital raised the resistance of the central nervous system not only to the barbiturate, but also to the central action of chlorpromazine and estocin. Resistance to the central action of spasmolytin was unchanged. The peripheral potentiating effect of all the substances in tolerant mice is not significantly changed. (English summary)—A. G. Pook.

11211. Olton, David S.; Johnson, Craig T. & Howard, Evelyn. (Johns Hopkins U) **Impairment of conditioned active avoidance in adult rats given corticosterone in infancy.** *Developmental Psychobiology*, 1975(Jan), Vol 8(1), 55-61.—Notes that intensive corticosterone treatment given to rats during the 1st postnatal week irreversibly decreases DNA accumulation in the cerebrum and cerebellum. After such hypercorticism in infancy, rats (*Rattus norvegicus*) in the present experiment were tested as adults in 2 conditioned active avoidance tasks. In comparison with litter-mate controls, the treated Ss were impaired in the acquisition of 2-way active avoidance but not in the acquisition of 1-way active avoidance. These data are consistent with other observations suggesting a hyperresponsiveness or hyperemotionality following corticosterone treatment in infancy.—*Journal abstract*.

11212. Perris, Carlo (Ed). (Umea U, Sweden) **A multicenter multidimensional study of some new longacting neuroleptic drugs.** *Acta Psychiatrica Scandinavica*, 1974, Suppl 249, 134 p.—Discusses the results of a 5-yr study of long-acting neuroleptic drugs conducted at several Swedish psychiatric hospitals. Specific investigations cited deal with the environmental factors influencing drug trials; the development of schizophrenic symptom rating scales; trials of pimozide, trifluoperazine, fluspirilene, and fluphenazine enanthate; ambulatory activity and EEG amplitudes during treatment trials; and an evaluation of the antipsychotic and sedative effects of neuroleptics and amphetamine. Findings indicate the usefulness of long-acting neuroleptics in the maintenance treatment of chronic schizophrenic inpatients. Methodological problems related to clinical trials of long-acting drugs are also highlighted.—R. Tomasko.

L. Vande Wiele & L. O. Stern (Eds), *Sex differences in behavior*. New York, NY: John Wiley & Sons, 1974. xvi, 495 p.

11214. Pober, Z. & Calhoun, W. K. (US Army Natick Lab, MA) **Effect of oxethazaine HCl on control of food and water intake in the rat.** *Pharmacology, Biochemistry & Behavior*, 1975(Jan-Feb), Vol 3(1), 69-74.—Used oral administration of the local anesthetic oxethazaine HCl to modify eating and drinking patterns in male Sprague-Dawley rats in 5 experiments. The addition of the oxethazaine HCl to the diet (.5 gm/100 gm diet) markedly reduced food intake. Similarly, administration of the drug by gastric intubation (gavage) also reduced food intake. This reduction was of short duration. The inhibition of water intake associated with administration of the drug was shown to be a secondary effect of

reduced food intake, rather than a direct action of the drug. Data indicate that local anesthesia of the gastrointestinal tract results in an inhibition of food intake. (20 ref)—*Journal abstract*.

11215. **Prabhu, V. K. & Nayar, K. K.** (U Kerala, Kariavattom, India) **Crustecdysone is without estrogenic or antiestrogenic activity in the rat.** *Experientia*, 1974, Vol 30(7), 821.

11216. **Rabadán, F. P. & Martínez Roldán, C.** (Lab Made S. A., Sección de Farmacología, Madrid, Spain) **Action of L-Dopa on the gonads of male rats.** *Experientia*, 1974, Vol 30(7), 826.—Investigated the effects on rats' testicles, seminal vesicles, and prostate resulting from an administration of levodopa. Male Wistar rats—39 test Ss and 19 controls—were studied. Weight of testicles, seminal vesicles, and prostate were diminished after 1 mo. (French summary)

11217. **Ranje, Christer & Ungerstedt, Urban.** (Karolinska Inst, Stockholm, Sweden) **Chronic amphetamine treatment: Vast individual differences in performing a learned response.** *European Journal of Pharmacology*, 1974(Dec), Vol 29(2), 307-311.—Trained 21 male Sprague-Dawley rats to swim an under-water Y maze. The position of the arm open to the water surface was indicated by difference in illumination between the 2 arms. After learning was completed, swim time and number of errors were recorded during treatment with dextroamphetamine (5-6 mg/kg). Repeated exposure to dextroamphetamine caused pronounced difference in the performance between individual Ss: some Ss behaved like the controls, while others showed progressively worse performance with each dose of dextroamphetamine even when the doses were spaced 12 days apart, indicating the priming effect of a single treatment. Results are discussed in relation to conflicting results in the literature concerning the effect of chronic amphetamine treatment. (17 ref)—*Journal abstract*.

11218. **Rhodus, Deborah M.; Elsmore, Timothy F. & Manning, Frederick J.** (Walter Reed Army Inst of Research, Washington, DC) **Morphine and heroin effects on multiple fixed-interval schedule performance in rats.** *Psychopharmacologia*, 1974, Vol 40(2), 147-155.—In Exp I 3 male Long-Evans hooded rats were trained to stability on a multiple fixed-interval (FI) 60-sec FI 60-sec schedule in which one component ended with food pellet reinforcements and the other with saccharin solution reinforcements. Morphine sulfate in intraperitoneal doses 3, 9, and 27 mg/kg and doses of heroin hydrochloride 1, 3 and 9 mg/kg produced roughly comparable dose-related decreases in both rate of responding and index of curvature in both the food and saccharin components. Exp II with 6 male Wistar albino rats investigated the effects of repeated administration of equivalent doses of morphine sulfate (7.5 mg/kg) and heroin hydrochloride (3.0 mg/kg) on responding in the above multiple FI 60-sec, FI 60-sec schedule. Increases in rates of responding were noted following 1 or 2 injections. Drug effects on FI scalloping diminished after a few injections. The present studies demonstrate a morphine-heroin equivalency ratio consistent with that used to produce analgesia. (23 ref)—*Journal abstract*.

11219. **Robert, A.; Nezamis, J. E.; Lancaster, C. & Badalamenti, J. N.** (Upjohn Co, Experimental Biology,

Kalamazoo, MI) **Production of duodenal ulcers in the rat by administration of digitoxin.** *Experientia*, 1974, Vol 30(7), 781-783.—Studied 100 male and 100 female rats. Male Ss showed a significantly greater resistance to digitoxin intoxication. (French summary)

11220. **Roerig, David L.; Hasegawa, Andrew T. & Wang, Richard I.** (Wood VA Ctr, Pharmacology Research Lab, WI) **Effect of phenobarbital pretreatment on the metabolism and biliary excretion of methadone.** *Biochemical Pharmacology*, 1975(Feb), Vol 24(3), 355-362.—Experimental data in rats suggest that enhancement of methadone metabolism by phenobarbital (PB) pretreatment was responsible for increased biliary excretion of methadone. Metabolism studies in vitro, using hepatic microsomes from PB-treated Ss, suggest that PB pretreatment enhances the metabolism of methadone in vivo. (25 ref)

11221. **Rolls, E. T.; Kelly, P. H. & Shaw, S. G.** (U Oxford, England) **Noradrenaline, dopamine, and brain-stimulation reward.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 735-740.—In 2 experiments with a total of 16 male Wistar albino and Lister hooded rats, attenuation of self-stimulation produced by blockade of noradrenaline receptors (phentolamine) or inhibition of noradrenaline synthesis (disulfiram) was associated with sedation (defined by decreased locomotor activity and decreased rearing). Attenuation of self-stimulation produced by blockade of dopamine receptors was associated with only minor sedation. Thus when both arousal and self-stimulation were measured, it was found that noradrenaline was less specifically involved in self-stimulation than dopamine. The noradrenergic theory of reward cannot be accepted until it is shown that noradrenaline has an effect on reward aspects of self-stimulation independently of its general effects on behavior measured here by locomotor activity and rearing. (48 ref)—*Journal abstract*.

11222. **Samson, Herman H. & Falk, John L.** (Rutgers State U, New Brunswick) **Ethanol and discriminative motor control: Effects on normal and dependent animals.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 791-801.—Examined the effects of ethanol in 4 male Holtzman albino rats using a task in which food pellets were made available if a manipulandum was held within a specified forceband for a fixed period of time. Following performance stabilization, the effects of acute doses of ethanol (1, 2, 3, and 4 g/kg) were determined. Ss were placed on a schedule-induced polydipsia regimen to produce chronic ethanol overdrinking, and the effects of additional acute doses of ethanol upon the task were determined. After various periods of ethanol overdrinking, the effects of short-term (5-10 hrs) ethanol withdrawal upon the motor task were evaluated. Following 10 mo of chronic ethanol overdrinking, the effects of complete ethanol withdrawal upon the motor task were examined. Prior to chronic ethanol exposure, only doses that produced blood ethanol levels above 120 mg/100 ml blood (3.5-4 g/kg) affected motor performance. Following chronic ethanol overdrinking, blood levels of over 230 mg/100 ml blood were needed to produce performance decrements, indicating the development of marked tolerance. Complete ethanol withdrawal disrupted performance for up

to 72 hrs, which is similar to the time course noted in the human alcoholic abstinence syndrome. (15 ref)—*Journal abstract.*

11223. **Samson, Herman H. & Falk, John L.** (Rutgers State U. New Brunswick) **Schedule-induced ethanol polydipsia: Enhancement by saccharin.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 835-838.—Examined the effect on the ethanol intake of male Holtzman albino rats of adding sodium saccharin to a 5% ethanol solution. 13 Ss were maintained at 80% of their free-feeding weight, in their home-cages with either 5% ethanol, or 5% ethanol-25% sodium saccharin as the only fluid available for 3 mo. 4 Ss were maintained in cages with automatic food dispensers that provided a 24-hr feeding regimen known to produce ethanol overdrinking. These Ss had 5% ethanol as their only available fluid for 1 mo, followed by the 5% ethanol-25% sodium saccharin mixture for 2 mo. No significant differences in ethanol intake were found between the 2 home-cage conditions. However, the addition of saccharin in the schedule-induced condition produced a marked increase in ethanol intake. The home-cage Ss showed no sign of an abstinence syndrome upon substitution of water for ethanol. In the schedule-induced group, severe tonic-clonic seizures occurred as a result of ethanol withdrawal.—*Journal abstract.*

11224. Sanghvi, I. S.; Singer, G.; Friedman, E. & Gershon, S. (New York U, Medical Ctr) **Anorexigenic effects of d-amphetamine and L-DOPA in the rat.** *Pharmacology, Biochemistry & Behavior*, 1975 (Jan-Feb), Vol 3(1), 81-86.—Compared the effect of amphetamine and levodopa in 200 22-hr food- and water-deprived male white Sprague-Dawley rats. Amphetamine produced marked anorexia, and levodopa significantly reduced food intake at 200 mg/kg. Following pretreatment with RO 4-4602, a decarboxylase inhibitor, 100 mg/kg of levodopa, a dose that did not significantly affect eating, produced marked anorexia. The anorectic effect of both amphetamine and levodopa was antagonized by propranolol. Phentolamine potentiated the anorectic effect of amphetamine and levodopa. Haloperidol (.1 mg/kg) failed to prevent the anorexia due to amphetamine but accentuated that due to levodopa. Methysergide, a serotonin antagonist, also failed to prevent the anorexigenic effect of amphetamine. Finally, the administration of levodopa with or without peripheral decarboxylase inhibition resulted in more than twice the increase in hypothalamic dopamine levels without significant changes in 5-hydroxytryptamine or norepinephrine levels. Data indicate a functional role for both norepinephrine and dopamine neurons in feeding behavior in the rat. (30 ref)—*Journal abstract.*

11225. Sbordone, Robert J. & Carder, Brooks. (U California, Los Angeles) **Mescaline and shock induced aggression in rats.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 777-782.—In 2 experiments a total of 66 male Sprague-Dawley rats were treated with mescaline and tested in a shock-induced aggression situation. Low doses (10 mg) prolonged the bouts in Exp I but not in Exp II. The topography of the fighting behavior for the Ss given this dose was like that of controls. Doses of 50 mg/kg increased the duration of the bouts and caused fighting to continue during a 5-min

period following shock termination. In addition, the topography of the behavior changed. The Ss treated with 50 mg/kg of mescaline were initially inactive and unresponsive to shock. After a few shocks, however, these Ss engaged in prolonged biting attacks while in a prone position. It is proposed that the higher dose of mescaline induced an experimental catatonia in which normal inhibitory mechanisms that control and limit aggressive behavior were ineffective. (17 ref)—*Journal abstract.*

**abstract.**  
11226. Schaefer, Gerald J.; Barrett, Robert J.; Sanders-Bush, Elaine & Vorhees, Charles V. (VA Hosp, Nashville, TN) **p-Chloroamphetamine: Evidence against a serotonin mediated learning deficit in PKU.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 783-789.—In 4 experiments, offspring of Sprague-Dawley rats were injected subcutaneously with 5.0 mg/kg of p-chloroamphetamine (PCA) or saline from 1-28 days of age. Groups treated with PCA showed hypoactivity in the open field at 29, 50, and 75 days of age when compared to Ss treated with saline and facilitated avoidance in Y-maze acquisition at 57-61 days of age. At 36 and 68 days of age, at the time of behavioral testing, brain serotonin (5HT) was reduced slightly or not at all. However, in separate groups, brain 5HT was reduced 23% and 35% in 14 and 26 day-old Ss after only a single treatment with PCA, suggesting that 5HT was reduced during the treatment period. At 66-68 days of age, 5HT turnover was also unaltered. Results suggest that the behavioral effects were due to neonatal 5HT depletion during a critical period of development rather than a concurrent 5HT depletion at the time of behavioral testing. Moreover, these data are at variance with the concept that neonatal 5HT depletion impairs learning ability and is the underlying CNS defect in phenylketonuria. (40 ref)—*Journal abstract.*

11227. **Schechter, Martin D.** (Eastern Virginia Medical School, Norfolk) **Effect of nicotine on response to frustrative non-reward in the rat.** *European Journal of Pharmacology*, 1974(Dec), Vol 29(2), 312-315.—Results of subjecting rats to frustrative nonreward in the Amsel double runway after administration of nicotine and saline reveal that nicotine decreased the magnitude of the frustrative effect when compared to saline. This finding is interpreted in light of other studies reporting a decline in aggression after nicotine administration.

11228. **Schmidek, W. R. et al.** (U São Paulo, Inst of Biomedical Sciences, Brazil) **Influence of loxapine on the sleep-wakefulness cycle of the rat.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 747-751.—The sleep-wakefulness cycle was studied in 18 Wistar albino rats under the influence of intraperitoneal loxapine, a neuroleptic derived from oxazepine succinate. One single dose of the drug (4-1.6 mg/kg) had a marked effect in depressing the paradoxical sleep (PS), maximal within 30 min and lasting about 24 hrs. Frequency and mean duration of PS episodes were differentially affected. Synchronized sleep was only slightly affected by loxapine, whereas no significant changes of wakefulness amount were detected. Chronic administration of the drug induced similar changes which disappeared in about 5 days. (23 ref)—*Journal abstract.*

11229. Schnell, R. C.; Prosser, T. D. & Miya, T. S. (Purdue U, School of Pharmacy & Pharmacal Sciences) **Cadmium-induced potentiation of hexobarbital sleep time in rats.** *Experientia*, 1974, Vol 30(5), 528-529. —Attempted to determine the minimum effective dose of cadmium required to potentiate drug response and the peak time for this phenomenon. Cadmium was administered as the acetate salt to male Sprague-Dawley rats, while control rats received a volume-equivalent injection of saline. 8 control group rats and 33 rats who were administered varying doses of cadmium acetate were monitored. In Exp I, the minimum dosage required to prolong hexobarbital sleep time was 2.0 mg/kg. In Exp II, the sleep times of all cadmium-dosed rats were significantly prolonged when compared to controls. Implications for the issue of cadmium as an industrial pollutant are discussed. It is concluded that, in any attempt to link contaminants with biological response and environmental exposure, the dose-response relationship between contaminant and specific biological changes must be established. 11230. Schoenfeld, Ronald I.; Neumeyer, John L.; Dafeidecker, William & Roffler-Tarlov, Suzanne. (Squibb Inst for Medical Research, Behavioral Pharmacology Lab, Princeton, NJ) **Comparison of structural and stereoisomers of apomorphine on stereotyped sniffing behavior of the rat.** *European Journal of Pharmacology*, 1975(Jan), Vol 30(1), 63-68. —Results of studies in male Sprague-Dawley albino rats show that N-n-propylnorapomorphine (NPA) was 35 times more potent than apomorphine (APO) in producing stereotyped behavior. The effect of NPA was blocked by perphenazine but unaltered by  $\alpha$ -methyltyrosine pretreatment and was accompanied by a decrease in central dopamine turnover. It is concluded that the activity of APO and NPA appears to be primarily in the (-)-isomer and is diminished but not lost by removal of either hydroxyl group from the catechol ring system. (22 ref)—*Journal abstract*.

11231. Schulz, Rudiger; Cartwright, Christine & Goldstein, Avram. (Stanford U) **Reversibility of morphine tolerance and dependence in guinea pig brain and myenteric plexus.** *Nature*, 1974(Sep), Vol 251(5473), 329-331. —Studied the pharmacological alterations occurring during morphine tolerance and dependence in the guinea pig myenteric plexus and the central nervous system, and determined that they are completely reversible. Within 7 days following abrupt withdrawal, sensitivities to morphine, naloxone, adrenaline, dopamine, and 5-HT (serotonin) returned to normal. The time span of recovery after morphine withdrawal is very similar in the myenteric plexus and the central nervous system. The parallelism appears to support the likelihood of a common underlying mechanism in both nervous tissues. The subsensitivities and supersensitivities accompanying morphine tolerance also appeared to reverse themselves. Findings support the view that opiate tolerance and dependence can disappear rapidly and completely. (18 ref)—*A. de la Haba*.

11232. Scott, D. F.; Schwartz, M. S.; Farrant, G. W. & Speirs, C. F. (London Hosp, Section of Neurological Sciences, England) **The importance of methodology in**

**drug studies using EEG.** *Electroencephalography & Clinical Neurophysiology*, 1974(Dec), Vol 37(6), 670-672. —During a double-blind investigation of a new adamantane compound (LRCL-1148) for its possible central nervous system depressant effects, the 8 normal volunteer Ss all showed more marked drowsiness and sleep in the 2nd EEG recording as compared with the 1st. The use of a strictly balanced design with placebo control showed that these EEG changes were not the result of drug administration but an order effect. (French summary)

11233. Sebens, Jantiena B. & Korf, Jakob. **Cyclic AMP in cerebrospinal fluid: Accumulation following probenecid and biogenic amines.** *Experimental Neurology*, 1975(Feb), Vol 46(2), 333-344. —Determined levels of cyclic adenosine 3' 5' -monophosphate (AMP) in rabbit cisternal cerebrospinal fluid (CSF) under a number of conditions. Ss were albino chinchillas and mixed breed rabbits. Cyclic AMP in CSF was increased by probenecid (intraperitoneally); this increase was not influenced by tricyclic antidepressant drugs, haloperidol, isoprenaline, or levodopa. Cyclic AMP, administered intravenously, did not penetrate into CSF. Intracisternally introduced noradrenaline, isoprenaline, dopamine, histamine, and intravenously injected isoprenaline all increased the CSF levels. Results indicate that cyclic AMP in the CSF is of central origin and is eliminated by a probenecid sensitive transport mechanism. (29 ref)—*Journal abstract*.

11234. Semmes, Josephine; Porter, Louis & Randolph, Mary C. (NIMH, Bethesda, MD) **Further studies of anterior postcentral lesions in monkeys.** *Cortex*, 1974(Mar), Vol 10(1), 55-68. —Monkeys with unilateral ablation of the hand area in the postcentral gyrus opposite the hand tested are reported to be severely impaired in somesthetic discrimination tasks. Earlier investigations had revealed either moderate or no impairment following complete bilateral removal of the postcentral gyri. An attempt was made to reconcile these divergent findings by exploring factors which might ameliorate the deficit: preoperative training on all tasks, a 6-mo recovery period, and complete or bilateral postcentral removals. None of these factors proved to be effective in lessening the severity of the impairment. It is suggested that, in the earlier studies, the representation of the finger tips near the bottom of the posterior bank of the central sulcus may have been spared.—*R. Gunter*.

11235. Shearer, Donald E.; Fleming, Donovan E.; Bigler, Erin D. & Wilson, Charles E. (VA Hosp, Neuropsychology Research Lab, Salt Lake City, UT) **Suppression of photically evoked after-discharge bursting following administration of anticonvulsants in waking rats.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 839-842. —Examined tridione, depakine, and dilantin with respect to their effect on the occurrence of photically evoked after-discharge (AD) bursting in 10 male, implanted Holtzman albino rats. It was observed that each of these anticonvulsants reliably suppressed AD bursting, although tridione and depakine were significantly more effective than was dilantin. Results are attributed to the locus of action of the anticonvulsants and suggest the usefulness of AD as an

index of the effectiveness of thalamically active drugs. (20 ref)—*Journal abstract*.

11236. Squire, Larry R. & Barondes, Samuel H. (U California, San Diego) **Memory impairment during prolonged training in mice given inhibitors of cerebral protein synthesis.** *Brain Research*, 1973, Vol 56, 215-225. —Unlike cycloheximide (CXM), isoCXM, which depresses activity like CXM but does not inhibit cerebral protein synthesis, had no effect on task acquisition by mice in a Deutsch Carousel. Studies of the effects of different doses of CXM on activity, cerebral protein synthesis, the acquisition effect, and memory 24 hrs after brief training tended to associate the acquisition effect with inhibition of cerebral protein synthesis rather than with side effects of CXM. Results suggest that impairment in learning observed a few minutes after the beginning of prolonged training is due to inhibition of protein synthesis. Expression of normal memory may depend on cerebral protein synthesis within minutes after the beginning of training.—*Journal summary*.

11237. Stern, J. A.; Bremer, D. A. & McClure, J. (Behavior Research Lab, St Louis, MO) **Analysis of eye movements and blinks during reading: Effects of Valium.** *Psychopharmacologia*, 1974, Vol 40(2), 171-175. —Monitored visual search activity during reading in 18 paid volunteer male undergraduates before and after a week long, double-blind regimen of Valium or placebo. Although Valium had little or no subjectively recognizable effect on the Ss, computer analyses of electrooculograms did indicate significant changes in the Valium group. Administration of Valium resulted in an increase in frequency of long fixation pauses, a general increase in duration of fixations following a line shift, and a decrease in velocity of saccadic eye movements during line shifts. The specific changes identified were consistent with an overall decrease in material read in the 2nd session in the Valium group.—*Journal abstract*.

11238. Syme, Lesley A. & Syme, G. J. (U Western Australia, Nedlands) **Group instability and the social response to methamphetamine.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 851-854. —Investigated the effects of intraperitoneal methamphetamine on body contact and social distances in 14 stable (familiar) and 14 unstable (unfamiliar) male New Zealand Black and White hooded rats. Although there was no difference in body contact in the stable and unstable saline groups, methamphetamine reduced body contact significantly more in the unstable group than it did for its stable counterpart. Methamphetamine had no effect on social distance in the unstable group but decreased social distance in the stable group. Group stability may therefore be not only desirable but necessary, if the effects of drugs on social responses are to be meaningfully interpreted. (23 ref)—*Journal abstract*.

11239. Tang, Maisy & Falk, John L. (Rutgers State U) **Dilutional hyponatremia due to diazoxide-produced polydipsia.** *Pharmacology, Biochemistry & Behavior*, 1975(Jan-Feb), Vol 3(1), 115-119. —In an experiment with 28 male Holtzman rats, subcutaneous injection of diazoxide every 3 hrs for a total of 5 doses in 15 hrs produced a state of elevated drinking and antidiuresis resulting in a massive, positive, self-imposed water load.

Dilutional hyponatremia was present, but not serum hyposmolality, owing to the increasing serum glucose and blood urea nitrogen. The mechanism by which diazoxide produces a polydipsia even in the presence of an accumulating water load may illuminate the genesis of other pathophysiological dilutional states. (34 ref)—*Journal abstract*.

11240. Thompson, Donald M. (Georgetown U, Medical School) **Repeated acquisition of response sequences: Effects of d-amphetamine and chlorpromazine.** *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 741-746. —3 male White Carneaux pigeons obtained food by making 4 responses on 3 keys in a specified sequence. All 3 keys were the same color throughout the response sequence. Under the learning condition, the 4-response sequence was changed from session to session. After learning (within-session error reduction) had stabilized, this baseline of repeated acquisition was used to assess the effects of varying doses of dextroamphetamine and chlorpromazine. For comparison, the drug tests were also conducted under a performance condition, in which the 4-response sequence was the same from session to session. Increases in total errors and pausing were obtained at the largest dose of each drug under both the learning and performance conditions. Under the learning condition, the error rate decreased across trials within each session, but the degree of negative acceleration was less in the drug sessions than in the control sessions. In contrast, under the performance condition, the error rate was relatively constant across trials, but was higher in the drug sessions than in the control sessions. (29 ref)—*Journal abstract*.

11241. Tseng, Liang-Fu; Loh, Horace H. & Wei, Eddie T. (U California, San Francisco) **Effects of clonidine on morphine withdrawal signs in the rat.** *European Journal of Pharmacology*, 1975(Jan), Vol 30(1), 93-99. —Studied the influence of clonidine on the naloxone-induced withdrawal signs, escape attempts, and precipitated shakes in morphine-dependent male Sprague-Dawley rats. Clonidine injected intraperitoneally or intravenicularly (iv) inhibited precipitated shakes and potentiated escape attempts induced by naloxone. Under pentobarbital anesthesia, precipitated shakes and ice-water-induced wet shakes were inhibited by clonidine and norepinephrine. Clonidine injected iv reduced body temperatures in morphine-implanted and in placebo-pellet-implanted Ss. Naloxone reduced body temperatures only in morphine-dependent Ss but not in placebo-pellet-implanted Ss. It is suggested that clonidine modulates morphine withdrawal signs by potentiating the behavior associated with heat dissipation (escape attempts) and by inhibiting the behavior associated with heat gain mechanisms (precipitated shakes). These effects may occur via stimulation of central noradrenergic mechanisms. (31 ref)—*Journal abstract*.

11242. Vista Hill Foundation. (San Diego, CA) **Sleep and sleeping pills.** *Drug Abuse & Alcoholism Newsletter*, 1974(Nov), Vol 3(7), 1-3. —Discusses the nature of sleep, of insomnia, and of drugs used to ameliorate insomnia. The 5 cycles of sleep are identified with particular reference to REM and non-REM states. Persistent sleep loss is described in terms of the biological rhythm of waking and sleeping and in terms of the 3 most common

kinds of insomnia: difficulty in falling asleep, broken sleep, and early morning awakening. The prevalence of these problems among older people is cited. The role of various drugs (e.g., cannabis, LSD and other hallucinogens) in sleep is delineated, and the misuse of sleeping medications is documented. Sleeping pills are discussed as a suicide agent, as a producer of insomnia when tolerance occurs, and as drugs of abuse. Recommendations are made for the use of alternative drugs in treating the insomnia problem. Specifically, it is suggested that muscle relaxants and tranquilizers be used either by themselves or in combination with sleep-inducing medication to assuage the tolerance effect usually found after prolonged ingestion of the latter.—R. S. Albin.

11243. **Vuillaume, Monique & Berkaloff, André** LSD treatment of *Pieris brassicae* and consequences on the progeny. *Nature*, 1974(Sep), Vol 251(5473), 314-315.—Studied 3 generations of *Pieris brassicae* to determine the effects of LSD treatment. It was found that progeny of LSD-treated parents possessed higher resistance to the substance, and physiological effects were detectable even several generations after treatment.

11244. **Yehuda, Shlomo**. (Bar-Ilan U, Ramat-Gan, Israel) *d*-Amphetamine and the sensory role of a rat's tail in thermoregulation or What the rat's tail tells the rat's brain. *Behavioral Biology*, 1975(Feb), Vol 13(2), 233-238.—The tail of a rat is one of the major effector organs in thermoregulation, aiding it to overcome excessive environmental heat. In addition, it also serves as a temperature-sensing organ. 2 sets of experiments with a total of 250 male Sprague-Dawley albino rats demonstrated the importance of the tail's sensory role in tailless Ss kept at various ambient temperatures, and in Ss whose tail and body were exposed to different ambient temperatures. When the tail sensed a cold ambient temperature (15-0°C), the body temperature increased, even if the S itself was kept at room temperature (20°C). Dextroamphetamine treatment enhanced the hyperthermia induced by the tail's exposure to cold temperature and caused an impairment of the tail's thermal sensory role.—*Journal abstract*.

11245. **Yew, D. T.; Ho, A. K. & Meyer, D. B.** (Wayne State U, Medical School) Effect of 6-hydroxydopamine on retinal development in the chick. *Experientia*, 1974, Vol 30(11), 1320-1322.—Studied the role of the catecholamine transmitter system on retinal development in the chicken. 120 fertile chicken eggs were divided into 3 groups: one treated with 6-hydroxydopamine (6-OHDA), the second with the vehicle solution, and the third untreated. Eggs with 19-day-old chick embryos were removed from the incubator, opened, the eyes removed, stained, and examined. The defective development of the inner segments, and the failure of the outer segments to develop at all, were noted. Photoreceptor malformation appeared to be related to the 6-OHDA dosage and the time of administration. Results indicate that 6-OHDA can induce developmental defects in the photoreceptors of the chick retina. (German summary)—R. Tomasko.

11246. **Zakharova, N. N.** (Central Serbsky Forensic Psychiatry Research Inst, Moscow, USSR) [The effect of seduxen on the perceptive and other functions of the central nervous system under emotional stress in man.]

(Russ) *Farmakologiya i Toksikologiya*, 1974(Jul-Aug), Vol 37(4), 396-398.—Studied the effects of seduxen (10 mg, introduced intramuscularly) on the perception of external signals (bursts of white noise) and on a variety of brain and autonomic functions under conditions of emotional stress in human Ss. Emotional stress was created by presenting single words concerned with conflict situations. Under normal conditions this dosage of seduxen had no effect on the perception of acoustic signals or on brain and autonomic functions. Under emotional stress, when all these functions change, seduxen significantly smoothed out the changes. (English summary)—A. G. Pook.

11247. **Zakusov, V. V.** (USSR Academy of Medical Sciences, Inst of Pharmacology, Moscow) [The influence of prolonged application of tranquilizers and antidepressants on the summational capacity of the central nervous system.] (Russ) *Farmakologiya i Toksikologiya*, 1974(Jul Aug), Vol 37(4), 389-390.—Studied the effects of diazepam, imipramine, and phthoracizine on the summation of impulses of the central nervous system in 18 intact rabbits. Electrical stimulation was applied to I of the hind limbs, and the number of stimuli necessary to provoke a motor response was determined. The preparations were introduced intravenously daily for 30 days. All 3 had a stimulating effect in small doses and a depressing effect in large doses, after both a single administration and prolonged administration. Diazepam and phthoracizine showed a more persistent effect than imipramine on the summation of impulses over a prolonged period. (English summary)—A. G. Pook.

11248. **Zenick, Harold**. (New Mexico Highlands U) Behavioral and biochemical consequences in methylmercury chloride toxicity. *Pharmacology, Biochemistry & Behavior*, 1974(Nov-Dec), Vol 2(6), 709-713.—Assessed the developmental periods during which exposure to methylmercury chloride (MMC) would result in permanent learning deficits in Holtzman albino rats. In addition, the mercury (Hg) content of the brain at these different stages was measured. 280 offspring of 35 mothers were tested. Offspring (30 days of age) of mothers exposed during gestation and offspring exposed directly to MMC for 9 days after weaning exhibited the greatest learning deficits on a water escape T maze. These deficits persisted through a retest session 21 days later. Biochemical analysis of brain Hg content indicated that Hg need not be present for these learning deficits to occur.—*Journal abstract*.

## ANIMAL PSYCHOLOGY

11249. **Altmann, Geza & Lanf, Siegnot**. (U des Saarlandes, Zoologisches Inst, Saarbrücken, W Germany) [Territory choice of white mice under Faraday conditions and in electrical fields.] (Germ) *Zeitschrift für Tierpsychologie*, 1974(Apr), Vol 34(4), 337-344.—Studied territory choice of CFI W68 SPF adult female mice in 3 connected cages, each of which was in a different electrical field. When the choice was among Faraday conditions (A), a step impulse field (10 Hz, 3500 V/m) (B), and a d.c. field (3500 V/m) (C), A was clearly preferred for a nest site and usually B for a playground.

If the choice was among normal conditions, A, and B, normal conditions were preferred for the nest site and again B for the playground. If the step impulse field was reduced to 180 V/m, nest site and playground were found as frequently in the step impulse field as in the cage with normal conditions. Findings show that mice are able to differentiate between various electrical fields; however, olfactory orientation had greater effects than the electrical parameters.—*English summary.*

11250. Barnett, S. A. & Walker, K. Z. (Australian National U, Canberra, ACT) **Early stimulation, parental behavior, and the temperature of infant mice.** *Developmental Psychobiology*, 1974(Nov), Vol 7(6), 563-577.—Conducted experiments with wild house mice and 3 inbred strains of mice (A2G/Tb, A/Tb, and C57BL/Tb) to examine the effects of early conditions of rearing on parental attention and on the heat exchanges of the infant mice. Results indicate that surface temperatures of wild and laboratory infant mice decreased after parental licking or loss of contact with the litter and increased on contact with the mother. Temperatures also increased rapidly if the mouse was held on the E's hand. (49 ref)—*Journal abstract.*

11251. Busnel, R.-G.; Busnel, M.-C. & Lehmann, A.-G. (CNRZ, Lab de Physiologie Acoustique, Jouy-en-Josas, France) **Synergic effects of noise and stress on general behavior.** *Life Sciences*, 1975(Jan), Vol 16(1), 131-137.—Studied the effects on the behavior of C57 and Swiss Rb albino male mice of noise associated with Ss' swimming performances with weight attached to their tails. Results show that there was a reduction of the latency time prior to submersion even at intensities as low as 60 db, independent of the frequency, in the range of mouse auditory discrimination. Furthermore, there was an increase in central nervous system excitability, which appeared in the reduction of the immobile time before swimming and in the increased number of seizures during the 1st 10 min of swimming. These last effects were linked with the frequency as well as with the intensity of the noise.—*Journal abstract.*

11252. Ewer, R. F. & Wemmer, C. (U Ghana, Legon) **The behaviour in captivity of the African civet, *Civettictus civetta* (Schreber).** *Zeitschrift für Tierpsychologie*, 1974(Apr), Vol 34(4), 359-394.—Describes expressive movements, including an appeasement action and other behavior. Besides defensive and distress vocalizations, there is a socially positive contact call and another believed to be a female sex call. Comfort movements, grooming, micturition, defecation, scent markings, and the methods of killing prey are described. Eating of prey is normally from the head down. Strong smelling foods frequently evoke scent-rubbing, the chin, neck, and shoulder being repeatedly rubbed along the food. The posture adopted by the female during mating is similar to that of the domestic cat. The development of the young is described, including defensive responses, play, and ontogeny of prey capture. The female's methods of providing the young with solid food are described, including the fact that their rudimentary nature is correlated with a prolonged lactation period. The possible significance of civet behavior in relation to the evolution of more complex patterns of the *Felidae* is

discussed. (German summary) (28 ref)—*Journal summary.*

11253. Hidaka, Toshitaka. (Tokyo U of Agriculture & Technology, Lab of Biology, Japan) **Logic of mating behavior of lepidoptera.** *Annals of the New York Academy of Sciences*, 1973(Dec), Vol 223, 70-76.—Stresses that the comparative research method should be used to find a general logic by comparing the whole life of species with each other. That this approach enables workers to discern themes of evolution is illustrated by the study of mating behavior in the butterfly and in the moth. The mating behavior of the butterfly begins with an initial phase guided by a visual cue which requires zigzag flying patterns. The next phase—a confirmatory one—involves short-range olfaction. The final phase—contact chemical phase—results in species recognition via antennal contact with the female body. Omission of 1 or 2 of these phases can still yield success. The mating behavior of moths is also detailed, resulting in a determination of the logic inherent in both sets of behavior. Comparative studies thus elucidate the theme hidden by variations in nature.—R. S. Albin.

11254. Hirsch, Jerry. (U Illinois) **Nonadaptive tropisms and the evolution of behavior.** *Annals of the New York Academy of Sciences*, 1973(Dec), Vol 223, 84-88.—Focuses on a property of both animals and plants from which an assessment of the evolutionary role of the electromagnetic features of the environment can be made. Tropisms (oriented, forced, nonadaptive movements) are exhibited by species under certain conditions of light, gravity, and electric and magnetic fields. Research is reported that supports the notion of tropisms as both adaptive and nonadaptive behaviors. Abnormal situations readily make manifest such tendencies and permit researchers to articulate the intrinsic architecture and dispositions of species. Tropisms are viewed as the expression of an interaction between the electromagnetic forces of the environment and the very organization of organisms, which comprises polarized assemblies of polarized molecules.—R. S. Albin.

11255. Kaiser, Heinrich. (U Köln, Zoologisches Inst, W Germany) **[Behavioural patterns and temporal behaviour in the dragonfly *Aeschna cyanea* (Odonata).]** *(Germ) Zeitschrift für Tierpsychologie*, 1974(Apr), Vol 34(4), 398-429.—Reports on 10 yrs of observations of dragonflies in several locations. During feeding flights they hardly react to conspecifics which cross their path. Males that are ready to copulate fly in a patrol characterized by constant height, frequent hovering, fighting with other males, and attempts to mate with females. The frequency of hovering declines during the patrol and the other characteristics of patrol flights also become less noticeable. In mating the male grasps the female from above and behind while flying and gets into a copulatory position. Copulation lasts about 2 hrs. Resting and basking postures are described. Eye cleaning is done with the forelegs during rest. Cleaning of wings and abdomen occurs in mid-flight, mainly as displacement activity. There is no evidence of territoriality, but the concept of temporal behavior is introduced. This consists of intraspecific aggression which is not bound to a limited area, but is time-dependent and causes a

temporal sharing of a certain area. (71 ref)—*English summary.*

11256. Keeton, William T. (Cornell U) **The mystery of pigeon homing.** *Scientific American*, 1974(Dec), Vol 231(6), 96-107.—Describes several studies suggesting that homing pigeons use both the position of the sun and magnetic information to determine the home direction. Inexperienced pigeons need both types of information, but experienced pigeons are probably able to weigh conflicting information. Vision is necessary for navigation only during the final approach to the home loft. A commonly-found bias in initial bearings following release is related to the characteristics of the release site and not to some peculiarity of the birds. Other suggested sources of information are discussed; several of these have not been supported by the data, and others need further testing.—*P. Tolin.*

11257. Losey, George S. (U Hawaii, Inst of Marine Biology) ***Aspidontus taeniatus*: Effects of increased abundance on cleaning symbiosis with notes on pelagic dispersion and *A. filamentosis* (Pisces, Blenniidae).** *Zeitschrift für Tierpsychologie*, 1974(Apr), Vol 34(4), 430-435.—Conducted field studies at Eniwetok Atoll from 1969 to 1972. A recent increase in the number of *Aspidontus taeniatus*, an aggressive mimic of the cleaner fish, has not had any obvious effects on the cleaning symbiosis involving the model species *Labroides dimidiatus* and its hosts. The host species appear to discern the mimic despite its close resemblance to the model. Pelagic floating behavior by young *A. taeniatus* may provide maximal distribution of the mimics throughout the available habitats. This floating stage has apparently been described as *A. filamentosus*. (German summary) (15 ref)—*Journal summary.*

11258. Lown, Bradley A. (State University Coll New York, Buffalo) **Effects of age on open-field behavior of the guinea pig.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1170.—A study of 21 male pigmented guinea pigs indicates that neonatal Ss aged 2 wks showed less activity than did the young adults aged 3 mo or mature adults aged 6 mo. This effect conflicts with other recent research indicating no developmental changes in activity in the guinea pig.

11259. Pribram, Karl H. (Stanford U) **The comparative psychology of communication: The issue of grammar and meaning.** *Annals of the New York Academy of Sciences*, 1973(Dec), Vol 223, 135-143.—Applies the methodology of comparative psychology to the study of grammar and meaning in the brains of primates. Meaning is defined to include both reference and use and can be of 2 kinds: the significant and the symbolic. Grammar is considered as a form of logic, especially as it refers to the ordering of sequential dependencies among communicative occurrences. Phrase structures that derive from this ordering are observable in animals other than humans (e.g., birds). Context-sensitive and context-free constructions lead to significant and symbolic communication among animals. Signs seem to function as a frame of reference for the communication through the identification of invariant properties. Symbolic behavior seems to refer to recurrent variances. Thus grammar (the structure of redundancies) and meaning (the resultant content) are related. It is concluded that

through a study of communication by linguistic speech, the study of the comparative psychology of the cognitive processes can proceed. (27 ref)—*R. S. Albin.*

11260. Sackett, Gene P. (U Washington, Regional Primate Research Ctr) **Sex differences in rhesus monkeys following varied rearing experiences.** In R. C. Friedman, R. M. Richart, R. L. Vande Wiele & L. O. Stern (Eds), *Sex differences in behavior*. New York, NY: John Wiley & Sons, 1974. xvi, 495 p.

11261. Syme, Lesley A. (U Western Australia, Nedlands) **Influence of age and sex on the behavior of rats deprived of the rearing response.** *Developmental Psychobiology*, 1975(Jan), Vol 8(1), 35-39.—One component of "general activity"—rearing on the hind legs—was restricted in 28 male and 26 female New Zealand Black and White rats both before (25 days) and after (50 days) the development of this response. In contrast to previous restriction studies, Ss were kept in groups and allowed free locomotor activity in the cage environment. After 8 wks, open-field testing showed that selective restriction decreased the frequency of rearing behavior, particularly unsupported rearing which requires physical coordination and balance. Effects were greater for females (which usually rear more than males) and for Ss restricted at weaning (25 days).—*Journal abstract.*

11262. Wickler, W. (Max Planck Inst for Behavioral Physiology, Seewiesen, W Germany) **Ethological analysis of convergent adaptation.** *Annals of the New York Academy of Sciences*, 1973(Dec), Vol 223, 65-69.—Notes that the main goal of ethology is to study the selective consequences of a given behavior. One way to discover the adaptive significance of a trait is to compare similar ones that have evolved independently in different groups of animals, thus studying convergently evolved comparative behavior characteristics. Pair bonding in cichlid fishes, shrimps, and birds is described with reference to the intensity of attraction, the degree of exclusiveness, and the degree of synchronization between the partners. It is concluded that "pair bonding" and the resulting "monogamy" are functional terms that indicate similar adaptive traits but not necessarily similar causal mechanisms. That the same reasoning is applicable to the concept "aggression" is demonstrable by reference to the varying criteria used to define it: the form, result, or content of behavior. The same result may, in different animals, be the outcome of quite different internal mechanisms. Aggression and bonding are but examples of behaviors that may have different meanings and antecedents for different species.—*R. S. Albin.*

### Learning & Motivation

11263. Anisman, Hymie & Wahlsten, Douglas. (Carleton U, Ottawa, Ontario, Canada) **Response initiation and directionality as factors influencing avoidance performance.** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1119-1128.—Conducted 3 experiments with a total of 234 male Holtzman rats. Results indicate that permitting Ss to run in either of 2 directions to avoid shock (any-way training) resulted in performance superior to that of 1-way or 2-way avoidance. In the any-way condition, Ss often selected a bidirectional mode of responding. Exposure to signaled inescapable shock enhanced avoidance in all avoidance

modes. Any-way training enhanced subsequent 2-way avoidance to a greater extent than did 1-way training. Results are interpreted in terms of the need to learn directional responses in avoidance training, role of response initiation in modifying avoidance behavior, and the effectiveness of running responses in determining avoidance performance. (18 ref)—*Journal abstract*.

11264. Blanchard, R. J.; Kelley, M. J. & Blanchard, D. C. (U Hawaii) **Defensive reactions and exploratory behavior in rats.** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1129-1133.—Describes 2 experiments with 20 male Wistar-derived and 16 male albino rats. Results indicate that forced preexposure to a novel situation reduced subsequent latencies to leave the home cage and enter the novel situation (free-exploration task). This finding and the finding of motivated flight from a novel to a less novel situation indicate that novel situations produce a pattern of defensive reactions very similar to those elicited by fear stimuli. It is suggested that reactions to novelty may be based largely—or entirely—on a fear mechanism.—*Journal abstract*.

11265. Brooks, Charles I. (Wilson Coll) **Primary frustration differences following brief partial-reinforcement acquisition under varying magnitudes of reward.** *Animal Learning & Behavior*, 1975(Feb), Vol 3(1), 67-72.—Reports 2 experiments with a total of 93 male albino rats. In Exp I, Ss which had received 6 partially reinforced runway acquisition trials, with a reward magnitude of 60-sec access to wet mash on rewarded trials, showed less persistent responding over highly massed extinction trials than Ss which had received the same acquisition schedule but reward magnitudes of either 1 or 10 45-mg pellets. In Exp II, Ss which had received 6 partially reinforced placements into 1 compartment of a 2-compartment box, with 60-sec access to mash on rewarded placements, jumped a hurdle faster to escape nonreward than Ss which had received the same reward schedule but 10 45-mg pellets on rewarded trials. Data support a primary frustration analysis for reward-magnitude manipulations within brief partial-reinforcement schedules.—*Journal abstract*.

11266. Brown, Charles H. & Rilling, Mark E. (Michigan State U) **Stimulus delay and the reduction of errors in the transfer of stimulus control.** *Animal Learning & Behavior*, 1975(Feb), Vol 3(1), 21-27.—24 white Carneaux pigeons initially trained on a simultaneous discrimination of line orientation ((Stimulus 1, or S1) were subsequently transferred to a wavelength discrimination (S2). 3 transfer procedures were employed. The abrupt-transfer Ss were "abruptly" switched from S1 to the S2 dimension. The stimulus-compounding Ss were trained on a compound stimulus consisting of S1 and S2 displayed in superimposition prior to the presentation of S2 alone. The stimulus-delay Ss were trained on a compound stimulus in which the presentation of the S1 component was delayed for successively longer intervals as a result of a correct response to the preceding trial. Stimulus-delay Ss transferred by responding to S2 prior to the presentation of S1 and the resulting formation of the compound. Ss transferred by the stimulus-compounding and the abrupt-transfer procedures displayed 5 and 10 times as many errors to the S2 dimension,

respectively, as Ss receiving the stimulus-delay procedure. (19 ref)—*Journal abstract*.

11267. Brown, Robert T. (U North Carolina, Wilmington) **Following and visual imprinting in ducklings across a wide age range.** *Developmental Psychobiology*, 1975(Jan), Vol 8(1), 27-33.—20 Peking ducklings ranging in age from 20 to 125 hrs were exposed to a moving silent object in an open circular apparatus until a criterion of 300 sec of following was met. All Ss met the criterion, and age did not correlate with the time required. In subsequent choice tests most Ss approached the imprinting object over a novel object, and age did not correlate with choice behavior. Results indicate that imprinting can occur over a fairly wide age range and that the traditional critical period for imprinting may, in part, be an artifact of laboratory methods. (21 ref)—*Journal abstract*.

11268. Capaldi, E. J. & Haggblom, Steven J. (Purdue U) **Response events as well as goal events as sources of animal memory.** *Animal Learning & Behavior*, 1975(Feb), Vol 3(1), 1-10.—Notes that current approaches emphasize the control exercised over behavior by various internal stimuli arising from goal events such as reward and nonreward. In contrast, certain earlier views emphasized the behavioral control exercised by internal stimuli arising from responding. The purpose of the present 3 experiments was to determine whether stimuli arising both from goal events and from response events control instrumental behavior, and if so, how much behavioral control is exercised by each. In the 3 experiments, a total of 156 male albino rats received partial reinforcement in a runway either at a 24-hr intertrial interval (ITI) or at both a 24-hr ITI and a shorter ITI (2 min, 15 min, 30 min, or 1 hr), with extinction always occurring at the shorter ITI. Results suggest that both goal-produced and response-produced internal stimuli control behavior simultaneously. In addition, it was found that at ITIs as long as 30 min, response-produced cues regulated responding about as strongly as goal-produced cues. (16 ref)—*Journal abstract*.

11269. Cone, Al L. (Lynchburg Coll) **Feeding time entrainment of activity and self-produced illumination change in a squirrel monkey.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 389-391.—Daily feeding time was changed or left the same for 4 20-day replications for 1 female squirrel monkey while quantifying tilt cage activity and number of illumination changes/hr. Periodic regression analysis indicates that a statistically significant circadian cycle (23.5-24.6 hrs) was present for each replication. Significant Phase  $\times$  Replication interactions verified that feeding time served as an effective entraining stimulus for the 2 dependent variables.—*Journal abstract*.

11270. Cooper, Peter H. & Trowill, Jay A. (U Denver) **Wood gnawing preference in rats.** *Physiology & Behavior*, 1974(Dec), Vol 13(6), 845-847.—Results of testing male Simonson rats for preferences among birch, mahogany, oak, and pine for gnawing indicated that mahogany was the most preferred. Its use is therefore suggested in future studies using wood gnawing as a behavioral measure.

11271. Costanzo, D. J.; Henke, P. G. & Bosley, D. R. (Muskingum Coll) **Reversal of visual discrimination problem and differential frustration effects in dominant and submissive rats.** *Animal Learning & Behavior*, 1975(Feb), Vol 3(1), 49-52.—Reports 2 experiments comparing performance in dominant and submissive male Wistar rats as determined by a food-competition procedure. The 48 Ss in Exp I were either trained to criterion or overtrained before being reversed on a visual discrimination task. Although the 2 groups did not differ significantly in learning the initial task, the dominant Ss were significantly slower on reversal than the submissives. Exp II, which utilized 26 Ss and a tandem runway, showed that when the reinforcer which maintained the running response was not available in the 1st goalbox, submissive Ss responded with a greater increase in running speed in the 2nd runway than dominant Ss. Findings are discussed as reflecting motivational differences between dominant and submissive rats.—*Journal abstract*.

11272. Davis, Stephen F. & Ludvigson, H. Wayne. (Austin Peay State U) **Differential conditioning as a function of exposure time to discriminative and nondiscriminative cues preceding response.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 385-388.—90 female albino Charles River rats received differential conditioning to large and small reward in a straight runway. 3 groups were confined to startbox for 0, 2, or 8 sec prior to the opportunity to traverse the runway, with no preresponse discriminative cues to signal reward magnitude until admission to the runway; 2 additional groups received the discriminative cues for 2 or 8 sec while confined in the startbox. All Ss learned the discrimination, though the sharp depression in performance to the negative stimulus (S-) found in certain other studies failed to appear. Discriminative cue presentation in the startbox did not influence performance. It is suggested that preresponse cues only influence a frustrative depression to S-, and that for unknown reasons such a depression failed to appear in this study. Startbox confinement depressed performance to both rewards, with longer durations producing greater depressions.—*Journal abstract*.

11273. Del Russo, Jon E. (Monmouth Coll) **Observational learning of discriminative avoidance in hooded rats.** *Animal Learning & Behavior*, 1975(Feb), Vol 3(1), 76-80.—Conducted an experiment with 50 Long-Evans hooded rats to determine the aspects of an observational situation facilitating subsequent acquisition of an observed task. 2 experimental groups were exposed to a model's performance of a 2-way discriminative shuttlebox avoidance task with a tone as the discriminative stimulus. One experimental group observed the performance of a naive demonstrator; the other experimental group observed a skilled demonstrator. A stimulus control group was exposed to the tone with no model present; a response control group observed demonstrator running with no tone present. A naive control group received no observational experience. All groups were subsequently tested on acquisition of the task. An analysis of variance on avoidance scores and Newman-Keuls tests for differences between means revealed that the 2 experimental groups performed significantly more

avoidances than the control groups. Exposure to the total tone-running sequence was found to be necessary for observational learning. Results are interpreted in terms of a sensory-sensory conditioning model.—*Journal abstract*.

11274. Doleys, Daniel M. & Davidson, Robert S. (VA Hosp, Miami, FL) **Repeated suppression and recovery of responding using response-produced electric shock.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1259-1268.—Stabilized the responding of 3 female White Carneaux pigeons on a fixed ratio (FR) 60 schedule of reinforcement. Response-produced electric shock, contingent upon the 60th response in each ratio, was introduced and systematically increased until responding was totally suppressed. The electric shock was removed, then reintroduced following the recovery of responding, and removed again after total suppression. The relationship between increased intensity of the electric shock and rate of responding was observed to be nonlinear. At several junctures responding increased when the intensity of the electric shock increased. The responding of each S under selected intensities of electric shock differed during the 2 periods when contingent electric shock was programmed. (16 ref)—*Journal abstract*.

11275. Dücker, G.; Nuttebaum, N. & Schulze, I. (U Münster, Zoologisches Inst, W Germany) [The influence of aggression on learning and forgetting in the fighting fish *Betta splendens* (Pisces, Anabantoidei).] (Germ) *Experientia*, 1974, Vol 30(7), 747-749.—Conducted 2 experiments, using 20 *Betta splendens* in each, to determine whether aggression-specific stimulation had any influence on learning and retention of a simple color discrimination task. Stimulated Ss showed poorer results than control Ss in learning and retention.—*English summary*.

11276. Etienne, Ariane S. (U Cambridge, England) **Age variability shown by domestic chicks in selected spatial tasks.** *Behaviour*, 1974, Vol 50(1-2), 52-76.—Assigned chicks to age groups (3, 6, and 13-14 days) and trained them to locate a worm which disappeared into a tunnel or behind a screen. Ss from each age group were then tested on 1 of 3 tasks varying in complexity; the worm disappeared (a) into a tunnel and reappeared on the other side, (b) behind a screen located at one end of a tube, or (c) behind 1 of 2 screens located at opposite ends of the test area. Capture latencies and percentage of rewarded trials were among the dependent variables recorded. In the 1st condition visual discovery of the worm occurred most rapidly in the oldest Ss, while in the 3rd condition the youngest chicks learned best to make the correct choice. Results are discussed in terms of place learning, response learning, and the cognitive viewpoint. (French summary) (30 ref)—S. R. Goldstein.

11277. Ettlinger, G. & Ridley, R. M. (Inst of Psychiatry, London, England) **Visual discrimination in the monkey: Distinguishing the incorrect response.** *Neuropsychologia*, 1975(Jan), Vol 13(1), 111-113.—Trained 12 immature rhesus monkeys to learn 2 visual discrimination tasks and the reversals of these tasks under 2 conditions: (a) with the response panel (or lid of food-box) locked after incorrect response and (b) with the panel (or lid) unlocked after incorrect response. Criterion was achieved more rapidly during original

learning with the panel locked, but no significant difference was observed during reversal learning. It is suggested that improved performance resulted when the panel remained locked because either the outcome was more salient or because the incorrect response was more frustrating. (French & German summaries)—*Journal abstract*.

11278. Gamzu, Elkan & Williams, David R. (Hoffman-La Roche, Nutley, NJ) **The source of keypecking in autoshaping.** *Animal Learning & Behavior*, 1975(Feb), Vol 3(1), 37-42.—Trained 12 male Silver King pigeons to step on a treadle to operate a grain hopper, under the control of an auditory stimulus. Subsequently, autoshaping consisted of pairing illumination of a response key with some of the subsequent tone presentations, reinforcement occurring only after a treadle response. One control group did not have a treadle or a treadle-response requirement. A 2nd control group received random presentations of an illuminated key. Neither paired nor random key presentations had any effect on treadlepressing. However, the paired key groups showed acquisition of pecking to the key, while the random group did not. Data suggest that pecking in the autoshaping procedure is not profitably analyzed as part of an operant sequence; autoshaping may involve a structuring of response repertoires that is independent of the effects of contingent reinforcement and shaping. Autoshaping seems to be governed by empirical temporal laws akin to those of classical conditioning. (30 ref)—*Journal abstract*.

11279. Gormezano, I. & Coleman, S. R. (U Iowa) **Effects of partial reinforcement on conditioning, conditional probabilities, asymptotic performance, and extinction of the rabbit's nictitating membrane response.** *Pavlovian Journal of Biological Science*, 1975(Jan-Mar), Vol 10(1), 13-22.—Investigated the classical conditioning and extinction of the rabbit nictitating membrane response under 100% and 2 50% reinforcement conditions (50% equated total trials, and 50% equated reinforced trials) at average intertrial intervals of 30 and 60 sec. It was found that (a) partial reinforcement reduced the rate of conditioning, but all groups eventually attained performance levels near 100%; (b) 1st-order and 2nd-order conditional probabilities following reinforced and nonreinforced trials were virtually identical; and (c) no partial reinforcement extinction effect was observed. (23 ref)—*Journal abstract*.

11280. Hammond, Lynn J. & Harman, Joan. (Temple U) **Shock escape vs food-rewarded running in a successive discrimination.** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 593-596.—Trained 2 groups of 20 male Sprague-Dawley rats for 100 trials on a successive discrimination in a runway where on half the trials nonreinforcement (S-) was preceded by an alleyway cue of darkness or ambient lighting. One group of hungry rats received food as a reward on reinforcement (S+) trials; while the other group of unhungry rats were shocked in the same runway and reinforced on S+ trials by shock termination in the goalbox, but nonreinforced by 30 sec delay of shock termination on S- trials. Ss given the appetitive training learned the discrimination within 20-30 trials, while those given aversive training

showed no evidence of forming a discrimination.—*Journal abstract*.

11281. Herman, Louis M. (U Hawaii) **Interference and auditory short-term memory in the bottlenosed dolphin.** *Animal Learning & Behavior*, 1975(Feb), Vol 3(1), 43-48.—Studied interference in auditory short-term memory in 1 female bottlenosed dolphin, using a delayed matching-to-sample task in 2 experiments. At each trial, 1 of 2 sample sounds, chosen randomly, was projected underwater for 4 sec and then, after a variable delay interval, both sounds were presented. A response to the sound matching the initial sample was reinforced. Correct matching was significantly reduced following short intervals between trials in combination with long delays after the sample (proactive interference), or when a near continuous irrelevant sound was inserted into the delay interval (retroactive interference). There was rapid habituation to interference if the irrelevant sound was short in duration relative to the delay interval. For both proactive and retroactive interference, the errors were predominantly responses to the sample sound appropriate to the prior trial rather than to the current trial, indicating that memory for the relative recency of events (temporal memory) was degraded by interference. When interference was deleted or minimized, temporal memory remained nearly perfect over 30-sec delay intervals. The longest tested. The importance of distinguishing between temporal memory and nontemporal, or event, memory in different forms of the delayed matching task is emphasized.—*Journal abstract*.

11282. Hurwitz, Harry M. (U Guelph, Ontario, Canada) **A note on the conditioned stimulus control of postshock responding.** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 554-556.—Trained 6 female hooded rats to leverpress to avoid shock. Typically, Ss emitted a burst of lever responses whenever shock occurred. Following 35 avoidance training sessions, Ss were occasionally presented with a tone (conditioned stimulus; CS) for 1 min before an unavoidable, inescapable shock (unconditioned stimulus; UCS) was administered. Avoidance deteriorated dramatically during CS (conditioned suppression), but a burst of responses occurred on termination of CS-UCS. When CS was presented without UCS—the classical extinction procedure—avoidance rapidly recovered during CS, but the response burst made to the termination of CS diminished only gradually and as a function of the number of CS presentations.—*Journal abstract*.

11283. Jackson, Patrick S. (U Cambridge, England) **A method for measuring generalization of imprinting effects in young chicks.** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1032-1037.—Describes 2 experiments, with a total of 180 Ross chicks as Ss, in which an attempt was made to construct a continuum of imprinting stimuli, together with a new method, the "stationary wheel," of estimating approach tendencies in young chicks. Ss were imprinted with 1 member of the continuum and either divided into subgroups, each of which was tested on 1 value of the continuum (Exp I), or tested on all values of the continuum (Exp II). Approach scores showed a significant decrement away from the training value at whichever end of the continuum chicks were trained.

Results show that the stationary wheel method yielded replicable approach data without the disadvantages inherent in the "arena-type" method of measurement. Analyses of a number of other measures, including peep calls, twitter calls, and approach orientation, are also discussed. (18 ref)—*Journal abstract*.

11284. Kadden, Ronald M.; Schoenfeld, William N. & Snapper, Arthur G. (Franklin Delano Roosevelt VA Hosp, Montrose, NY) **Aversive schedules with independent probabilities of reinforcement for responding and not responding by rhesus monkeys: II. Without signal.** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1189-1197.—Manipulated independently the probabilities of aversive stimulus presentation given the occurrence or the nonoccurrence of a leverpress response. 10 naive male rhesus monkeys (*Macaca mulatta*) were divided into 5 groups, each group receiving a different sequence of the 2 probabilities and thereby a different sequence of electric shock presentation schedules ranging between avoidance and punishment. The schedules provided systematic control both of the amount of response facilitation that occurred when response-produced shocks were first introduced following avoidance training and of the postfacilitation response rate decline. When the probability of shock presentation following a response was less than that for not responding, scalloped response patterns occurred; when the relative shock probabilities were reversed, biphasic response patterns were observed. (17 ref)—*Journal abstract*.

11285. King, Donald L. (Howard U) **An image theory of instrumental conditioning.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1115-1122.—Discusses theories of classical conditioning and images, which hold that an image of the goal for an instrumentally conditioned response occurs by way of classically conditioned associations between the stimuli of the learning situation and the stimuli produced by the instrumentally conditioned response and between these response-produced stimuli and the goal. The animal is viewed as behaving in order to change the vividness of the image of the reinforcer, associated with a change in the "reinforcing effect" of the image of the reinforcer. The animal does this by producing successively closer approximations to the stimuli produced by the instrumentally conditioned response via a feedback process, this response thereby eventuating. Image approaches to some instrumental conditioning results and some theories of instrumental conditioning are also discussed. (17 ref)—*Journal abstract*.

11286. King, Maurice G.; Pfister, H. Peter & DiGiusto, Eros L. (U Newcastle, NSW, Australia) **Differential preference for and activation by the odoriferous compartment of a shuttlebox in fear-conditioned and naive rats.** *Behavioral Biology*, 1975(Feb), Vol 13(2), 175-181.—96 adult, male Wistar rats were either fear conditioned in a Plexiglas tube or were subjected to a control procedure. Each S was subsequently placed in a 2-compartment shuttlebox and tested for activity and time spent in the compartment of the shuttlebox which contained odoriferous fecal materials generated by other fear-conditioned Ss. Results show that fear-conditioned Ss were significantly less active than controls and spent

significantly less time than controls in the odoriferous compartment of the shuttlebox. In addition, controls spent significantly more time in the odoriferous compartment than in the nonodoriferous compartment. Findings suggest that odors generated by stressed rats do not have alarm pheromone properties.—*Journal abstract*

11287. Klare, Warren F. (Syracuse U) **Activity level changes preceding runway trials: An index of conditioned fear.** *Behavior Research Methods & Instrumentation*, 1975(Jan), Vol 7(1), 26-28.—Conducted 2 experiments with a total of 24 male and 16 female Long-Evans hooded rats in which Ss were dropped into a shock runway from an enclosed chamber where activity was monitored. Those that received shock in the runway showed a reliable decline in activity, significantly correlated with a reliable rise in running speed. When extinction trials were widely spaced (Exp II), the activity-level measure accurately monitored both extinction and spontaneous recovery of fear. Results suggest the activity measure as a useful tool for investigation of fear in complex behavior.—*Journal abstract*.

11288. Knutson, John F. & Schrader, Susan P. (U Iowa) **A concurrent assessment of schedule-induced aggression and schedule-induced polydipsia in the rat.** *Animal Learning & Behavior*, 1975(Feb), Vol 3(1), 16-20.—3 male hooded rats subjected to fixed interval (FI) 60-sec and FI 120-sec schedules of reinforcement were permitted concurrent access to a licking tube and a restrained target rat. While both polydipsia and attack occurred, polydipsia was the predominant schedule-induced behavior. When attack occurred, and the licking tube was also available, attack usually followed licking in the interreinforcement interval. Eliminating access to the target did not influence polydipsia, and removal of the licking tube did not affect the frequency of aggressive episodes.—*Journal abstract*.

11289. Kop, Pieter F. (Katholieke Hogeschool, Tilburg, Netherlands) **Aversive schedules with independent probabilities of reinforcement for responding and not responding by rhesus monkeys: I. With signal.** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1180-1188.—Applied 2 independent probabilities of electric shock presentation to 12 naive male rhesus monkeys (*Macaca mulatta*) as the independent variables defining schedules of aversive control: (a) the probability that a fixed signal period would end with a shock if a specified response were made and (b) the probability that the fixed signal period would end with shock if a specified response were not made. Systematic changes in the probability values generated several familiar schedules of aversive control, as well as several intermittent procedures. Response rate tended to rise during the signal period when the probability values were set so that not responding was more likely to produce a shock than responding; response rate tended to fall during the signal period when the probabilities were set so that responding was more likely to produce shock than not responding. Response patterning in time was also evident during the interval between signals when no consequences were programmed. These characteristics of response patterning reflected the changes in the 2 independent probability variables in ways that simple measures of response

rate and shock rate alone did not. (15 ref)—*Journal abstract.*

11290. Kop, Pieter F.; Kadden, Ronald M. & Schoenfeld, William N. (Katholieke Hogeschool, Tilburg, Netherlands) **Aversive schedules with independent probabilities of reinforcement for responding and not responding by rhesus monkeys: III. Recovery of avoidance baseline.** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1198-1208.—Investigated the effect of prior response history on subsequent avoidance responding. In Exps I and II, using 12 and 10 male rhesus monkeys that had served in previous experiments by the authors (see PA, Vol 53:Issue 6), up to 5 sequences of aversive stimulus presentation schedules provided a range from no responding to complete avoidance response recovery, whether with or without signaled shock. Exp III, with 12 naive rhesus monkeys, demonstrated that the same range of avoidance response recovery could be obtained by the use of only selected schedules rather than a prolonged sequence. These findings provide further support for the power of 2 independent probability variables, governing reinforcement delivery for responding or nonresponding, for generating schedules of reinforcement. (16 ref)—*Journal abstract.*

11291. Leaton, R. N. (Dartmouth Coll) **Long-term retention of the habituation of lick suppression in rats.** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1157-1164.—Conducted 5 experiments with a total of 97 naive male albino Holtzman rats. Retention of habituation of suppression of licking to the presentation of 2-sec pure tones was measured 7, 21, and 42 days after an initial series of habituation-training sessions (10 trials/day for 4 days). No recovery was found after 7 or 21 days, and there was only slight recovery after 42 days. No group approached its initial level of responsiveness. Habituation produced by a single, 2-sec stimulus was retained for at least 30 days. Recovery did occur with changes in the frequency of the auditory stimulus or the modality of stimulus. Habituation was insensitive to changes in the test environment other than the test stimulus itself. Habituation transferred from the behavioral context associated with nondrinking to that associated with drinking. (24 ref)—*Journal abstract.*

11292. Lee, C. T.; Wong, Paul T.-P. & Chen, Jawsy. (Brooklyn Coll, City U New York) **Durable partial reinforcement effect and social dominance in two inbred mouse strains.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 400-402.—Investigated the partial reinforcement effect (PRE) in a total of 10 C57BL/10J (C57) and DBA/2J (DBA) inbred male mice in a straight runway. The PRE was obtained in both strains and was sustained through extended extinction and continuously reinforced (CRF) reacquisition. 2 wks after the completion of the 2nd runway extinction test, partial reinforcement (PRF) and CRF Ss of each strain were pitched against each other in a tube dominance test. PRF Ss won a significantly greater number of the contests.—*Journal abstract.*

11293. Linton, Leslie & Roberts, Albert E. (Catawba Coll) **Changes in unsignalled avoidance behavior when a pre-shock CS is response-produced.** *Psychological*

*Reports*, 1974(Dec), Vol 35(3), 1251-1258.—Trained 6 female hooded rats under a procedure in which signaled shock conditioned stimulus—unconditioned stimulus (CS—UCS) was superimposed on unsignalled avoidance behavior. The UCS was delivered for  $\frac{1}{4}$  sec for 3 Ss (Condition 1) and given for 1 sec to 3 Ss (Condition 2.) While the CS—UCS procedure was maintained, at different times during the session a response briefly produced the preshock CS. Blocks of sessions in which the response-produced CS occurred in addition to CS—UCS were alternated with blocks of CS—UCS sessions without the response-produced CS. Under the CS—UCS procedure, avoidance in CS was enhanced for Ss in Condition 1 and was enhanced to a lesser degree during the response-produced CS. However, the CS controlled suppressed avoidance when followed by UCS and when response-produced.—*Journal abstract.*

11294. Lucas, Gary A. (U Missouri, Kansas City) **The control of keypecks during automaintenance by prekey-peck omission training.** *Animal Learning & Behavior*, 1975(Feb), Vol 3(1), 33-36.—Measures of 3 white Carneaux pigeons' prekeypecking (pecking in front of the response key) during automaintenance sessions with keypeck omission contingencies indicate that prekey-pecks occurred frequently and were often followed by grain delivery. When the omission procedure was extended to prevent food delivery following any trial on which prekeypecks occurred within 2 in of the response key, keypecking was not maintained. Results suggest that the automaintenance keypeck is part of a sequence of approach behaviors, including prekeypecks. The persistence of keypecking during automaintenance schedules appears to result from the adventitious reinforcement of prekeypecks close to the response key, and the effectiveness of the omission procedure seems to depend upon the extent of the approach behaviors which result in omission. (15 ref)—*Journal abstract.*

11295. Lyons, Joseph E.; Kliepe, William D. & Siegel, Candy. (U Arizona) **The effect of increasing the response rate in S<sub>1</sub> and S<sub>2</sub> on stimulus generalization and the peak shift.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 421-423.—A study of 6 naive adult Silver King pigeons shows that differentially increasing the response rate in both the first and second stimulus by changing from a multiple variable interval (VI) 5-, VI 5-min reinforcement to a multiple VI 1-, VI 3-min schedule produced a peak shift in 5 Ss. Results suggest that a change in reinforcement density independent of a response rate reduction in the 2nd stimulus is a sufficient condition to produce the peak shift.—*Journal abstract.*

11296. Mackintosh, N. J. (U Sussex, Lab of Experimental Psychology, Brighton, England) **The psychology of animal learning.** London, England: Academic Press, 1974. xiv, 730 p. £8.—Presents a comprehensive and detailed treatment of the procedures, results, and interpretation of psychological studies of learning in animals, covering the original and latest experiments and theories. Included are sections on classical conditioning, instrumental learning, avoidance and punishment, contrast effects, extinction, generalization, and discrimination learning. (89 ref)

11297. **Martin, James T. & Schutz, Friedrich.** (U Minnesota, St Paul) **Arousal and temporal factors in imprinting in mallards.** *Developmental Psychobiology*, 1975(Jan), Vol 8(1), 69-78.—Examined a number of factors affecting the learning processes in laboratory imprinting, using 80 mallard ducklings as Ss. 2 factors alone explained the degree to which Ss learned the characteristics of a given model: the length of exposure to the model and the endogenous arousal state of the duckling. A 3rd factor, the effect of muscular exertion, was not significant. The characteristics of some models were more rapidly learned than others, and the significance of this fact for biochemical studies of learning is discussed. In this study ease of learning coincided with innate preference, suggesting the presence of a neural filtering mechanism in the duckling which alters the assimilation of information into the central nervous system and hence controls both innate preference and learnability. (22 ref)—*Journal abstract*.
11298. **McHose, James H. & Blackwell, David R.** (Southern Illinois U) **Performance in differential instrumental conditioning as a function of the pattern of partial S+ reward.** *Animal Learning & Behavior*, 1975(Feb), Vol 3(1), 63-66.—In 2 experiments, a total of 46 male albino rats received differential instrumental conditioning trials in a nonchoice brightness-discrimination apparatus. In each experiment, groups differed with respect to the pattern of rewarded and nonrewarded positive stimulus (S+) trials. Response in S- was never reinforced. Results of both experiments indicate that the pattern of S+ reward events influenced S- response levels in a fashion consistent with expectations derived from stimulus-specificity theory.—*Journal abstract*.

11300. **Millard, W. J. & Woods, Paul J.** (U Massachusetts, Amherst) **Frustrative nonrelief in instrumental escape conditioning.** *Animal Learning & Behavior*, 1975(Feb), Vol 3(1), 28-32.—Examined the generality of the frustration effect in an aversive stimulus conditioning procedure by training and testing 40 male BHE rats in a double cold-waterway escape conditioning apparatus. Experimental and control procedures analogous to appetitive conditioning experiments indicated that frustrative nonrelief (i.e., reinforcement omission) in the 1st goal tank yielded significant increments in swimming speed in the 2nd waterway, and that these increments in performance were dependent upon initial training with continuous relief (i.e., reinforcement) in the 1st goal tank. Extensions of the generality of the frustration effect are discussed. (26 ref)—*Journal abstract*.
11301. **Misanin, James R.; Hardy, Sheryl; Goodyear, Janet & Nagy, Z. Michael.** (Susquehanna U) **Effects of shock intensity on speed and response competition in the escape training of neonatal and infant rats.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 397-399.—Examined the effect of varying shock intensity on response competition (turning) and speed in the escape training of a total of 42 Wistar albino rats, 3-11 days old. Ss were given 25 escape training trials in a straight alley with .1, .2, or .4-ma 60-Hz ac shock as the motivating stimulus. Results indicate that the younger the rat or the more intense the shock, the less likely escape training was to be completely effective. On .1 ma, only the 7-11 day old Ss showed an intrasession speed increase, and on .4 ma, only the 11 day olds showed such an increase. The 7-11 day old Ss were also the only Ss to increase speed as shock intensity increased. Response competition decreased over training trials for all age groups on both .1 and .2 ma, but only the 5- and 7-day-old Ss showed such a decrease on .4 ma. For all age groups, however, response competition varied inversely with shock intensity.—*Journal abstract*.
11302. **Nageishi, Yasuhiro & Imada, Hiroshi.** (Kwansei Gakuin U, Nishinomiya, Japan) **Suppression of licking behavior in rats as a function of predictability of shock and probability of conditioned-stimulus-shock pairings.** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1165-1173.—In Exp I, the effects of various degrees of predictability of electric shock upon rats' licking behavior were studied using 45 male albino rats. The basal rate of licking became progressively lower as unpredictability of shock increased. It was also found that Ss could utilize "time" as a predictor of safety and danger. In Exp II, using 48 Ss, the relationship between conditioned emotional response (CER) and the probability of conditional stimulus (CS) being paired with shock was studied under the matched basal rate of licking by making all shocks predictable. The CER was an increasing function of the probability of CS-shock pairings. Results are discussed with reference to M. Seligman's (1969) safety-signal hypothesis and R. Rescorla's (1968) probabilistic theory. (19 ref)—*Journal abstract*.
11303. **Olson, Richard D.; May, James G. & Williams, George D.** (U New Orleans) **A reinterpretation of extinction in appetitive conditioning.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 409-410.—Compared the effects of response-independent reinforcement and the withdrawal of response-contingent reinforcement on food rewarded barpressing rates in 24 male Sprague-Dawley rats. Neither the resultant decreases in response rate nor subsequent reacquisition performance were differentially affected. It is suggested that the traditional response-contingent reinforcement withdrawal was actually a mild form of punishment and that only the response-independent procedure validly represented extinction.—*Journal abstract*.
11304. **Olton, David S. & Samuelson, Robert.** (Johns Hopkins U) **Decision making in the rat: Response-choice and response-time measures of discrimination reversal learning.** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1134-1147.—Tested 6 water-deprived male albino rats in 6 consecutive light-dark simultaneous discrimination reversals in a T maze. Measurements were obtained of (a) the animal's choices, (b) the time from the start box to the choice point, (c) the time in the choice point, and (d) the time from the choice point to the water spout at the end of the arm. Results indicate that response times were a reliable indicator of discrimination reversal learning and that the discrimination process was composed of separate prechoice, choice, and postchoice components. (20 ref)—*Journal abstract*.
11305. **Pavlik, W. B. & Collier, Alexis C.** (Virginia Polytechnic Inst & State U) **An analysis of "signaled**

**double-alternation patterning" in the rat.** *Animal Learning & Behavior*, 1975(Feb), Vol 3(1), 73-75.—7 male hooded rats were given training with double alternation of rewards and nonrewards in which the 1st reward or nonreward of each pair occurred in a black runway and the 2nd in a white runway. Ss developed fast running on rewarded trials in both runways and slow running on nonrewarded trials in both runways—signaled double alternation patterning. A subsequent shift in the reinforcement schedule produced a period of reversed patterning—slow on rewarded trials and fast on nonrewarded trials. Results are consistent with a compound stimulus discrimination interpretation of signaled double-alternation patterning rather than with a selective memory-retrieval explanation.—*Journal abstract.*

11306. **Rosenberg, Jordan.** (California State U, Hayward) **Reinforcement probability and concurrent operants.** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 582-584.—Tested the maximizing principle which suggests that when reinforcements for concurrent operants are programed by independent variable-interval schedules of reinforcement, the relative response rate obtained for each operant will approximate the relative reinforcement rate for that operant. This relationship, called matching, appears to be a necessary consequence of a maximizing principle which states that the operant emitted is the one having the momentarily greater reinforcement probability. To test the maximizing principle rats were trained to respond on either 1 of 2 levers. Whether a leverpress was reinforced was governed by a random process having a constant reinforcement probability which was not necessarily the same for the 2 levers. After a few sessions' exposure, responding occurred nearly exclusively to the lever having the greater reinforcement probability as predicted by the maximizing principle.—*Journal abstract.*

11307. **Russo, Dane.** (U South Carolina, Spartanburg) **Transfer of persistence in the domestic chick: Effects of imprinting experiences on later instrumental responses.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 381-384.—Investigated the effects of obstructed and unobstructed imprinting approach on subsequent instrumental responding. 4 groups of domestic chicks ( $N = 34$ ), in 2 separate replications, received imprinting or control treatment during the 1st wk of life and later acquired a food-motivated running response in a runway for continuous reward. Runway acquisition results reveal no significant differences between imprinting, imprinting shock, shock control, and handling control Ss. However, significantly different patterns of persistence across groups and replications were evident during runway extinction. Results are explained in terms of a counter-conditioning notion of response persistence.—*Journal abstract.*

11308. **Shafer, Scott W. & Stephens, Mark W.** (Pittsburgh Child Guidance Ctr, PA) **Emotionality, conditioned helplessness, and escape conditioning.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1051-1056.—Examined the role of emotionality in mediating conditioned helplessness by comparing the performance of 16 handled (low emotionality) and 16 nonhandled (high emotionality) litters of Purdue-Wistar rats, half of each group having had prior experience with inescapable

shock (conditioned helplessness) and half without such experience on a task requiring escape from shock. Generalization of helplessness effects was tested by subsequently testing Ss in a 2-way shuttle box with a loud escapable buzzer as the unconditioned stimulus. Differences in activity level in the absence of an aversive stimulus were measured later. Prior experience with inescapable shock did inhibit performance on the shock-escape task but emotionality did not, and emotionality differences did not interact with prior experience with inescapable shock. Emotionality affected shuttle-box performance, but conditioned helplessness did not. Activity level was reduced significantly by the conditioned helplessness experience, but was marginally related to emotionality.—*Journal abstract.*

11309. **Siegel, Shepard.** (McMaster U, Hamilton, Ontario, Canada) **Flavor preexposure and "learned safety."** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1073-1082.—Conducted 3 experiments with a total of 131 male Wistar rats. Results indicate that (a) a single preexposure to a distinctive flavor resulted in both a retardation of aversion learning (if the flavor was later paired with toxicosis) and a preference for this flavor (if the flavor was not paired with toxicosis); (b) preexposure-induced preferences were retained over a 24-day period and were not attributable to thirst reduction consequent upon ingestion; and (c) Ss evidenced a preference for a preexposed solution by subsequently ingesting relatively great amounts of this solution when it was the only fluid available (as well as by choosing it over an alternative, simultaneously available solution). Results are discussed in terms of a "learned safety" interpretation of the deleterious effects of flavor preexposure on flavor-aversion learning. (27 ref)—*Journal abstract.*

11310. **Solomon, Paul R.; Lohr, A. Craig & Moore, John W.** (U Massachusetts, Amherst) **Latent inhibition of the rabbit's nictitating membrane response: Summation tests for active inhibition as a function of number of CS preexposures.** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 557-559.—64 New Zealand rabbits received classical conditioning of the nictitating membrane response to a light as a conditioned stimulus. Experimental Ss then received 18, 36, 118, or 354 nonreinforced tone presentations followed by summation tests for active inhibition in which the tone was compounded with the light. Control Ss sat restrained in the conditioning chambers for periods of time corresponding to the experimental Ss but did not experience the tone between initial conditioning to the light and the summation test phase. The degree to which addition of the tone depressed conditioned responding to the light was essentially the same for experimental and control groups, thereby negating the possibility that the tone possessed active or conditioned inhibitory properties.—*Journal abstract.*

11311. **Spencer, Boyd & McGown, W. P.** (Eastern Illinois U) **DRL performance and water availability: Enhancement or interference?** *Psychological Reports*, 1974(Dec), Vol 35(3), 1023-1028.—8 Charles River female albino rats were divided into 2 groups that were exposed to a differential reinforcement of low rates (DRL) 18-sec schedule. One group had water available

for the 1st 30 days while the 2nd did not. Ss with water available initially showed more reinforced barpresses, but by the end of the 2nd wk Ss with no water available demonstrated superior performance. After the initial 30 days the conditions of availability of water were reversed. Ss with water available consistently received fewer reinforcements for the remaining 28 days of the experiment. Also, they consumed far less water than did the group which had water available during the initial 30 days. Results are discussed in terms of schedule-induced polydipsia.—*Journal abstract.*

11312. Stevens, David A. (Clark U) **Determination of stimuli "neutral" with respect to generalization from horizontal-vertical stripes discrimination.** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 564-566.—To determine stimuli with which there would be no differential generalization when used in transfer tests, 10 male Charles River CD rats learned a successive vertical-horizontal stripe discrimination and were then tested for generalization with the following stimuli: 4-cell checkerboard, lattice, and 8 sets of stripes ranging in slope from 10-80°. There was no differential generalization with the checkerboard, but there was generalization from horizontal stripes to the lattice. Interpolation from responses to stripes of 40° and 50° slopes indicated that with a slope of 42.9° there would be equal generalization from the horizontal and vertical standards.—*Journal abstract.*

11313. Svendsrod, Rolf & Ursin, Holger. (Norsk Gallup Inst, Oslo, Norway) **A factor-analytic study of the acquisition of a conditioned emotional response in rats.** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1174-1179.—Analyzed data from 30 male Möll-Wistar albino rats on a fixed-ratio 15 schedule of reinforcement for food acquiring a conditioned emotional response (CER). Factor 1 represented the conditioning process; Factor 2 was believed to represent the orienting response. The 2nd factor had high loadings on the early trials and a gradually decreasing loading for later trials. The shape of the curve of factor loadings over trials indicates that there was initially sensitization (including dishabituation) and then habituation of the orienting response as the CER was acquired. Data from prehabituation and changes in stimulus conditions confirms that Factor 2 represented the orienting response. 2 independent processes appear to be involved during CER learning: the orienting response and the ordinary CER acquisition.—*Journal abstract.*

11314. Terrace, H. S.; Gibbon, J.; Farrell, L. & Baldock, M. D. (Columbia U) **Temporal factors influencing the acquisition and maintenance of an auto-shaped keypeck.** *Animal Learning & Behavior*, 1975(Feb), Vol 3(1), 53-62.—Describes 2 experiments with a total of 132 male white Carneaux pigeons. Food-deprived Ss were given brief meals of grain following the presentation of a light on a response key. Pecking the key had no consequence; virtually all Ss pecked the lighted key. The number of trials prior to the 1st peck varied inversely with the value of the mean interval between light onsets. Trials to criterion was a negative power function of the value of the intertrial interval. The addition of a 2nd stimulus, never followed by food, retarded the acquisition of the keypeck, particularly at

short intertrial intervals. During steady state performance, the value of 2 measures of response strength—rate and probability of responding—increased as a function of the duration of the intertrial interval. (30 ref)—*Journal abstract.*

11315. Thorpe, W. H. (U Cambridge, England) **Is there a comparative psychology? The relevance of inherited and acquired constraints in the action patterns and perceptions of animals.** *Annals of the New York Academy of Sciences*, 1973(Dec), Vol 223, 89-112.—Affirms the existence of comparative psychology, with the following qualifications. The mere comparison of the behavior of an animal with that of a human, in a problem situation of the type primarily designed to test the responses of a human being, does not constitute an experiment in comparative psychology. It is necessary to first study in detail the sensory capacities, movement patterns, drive states, and hormonal influences under which the experimental animal normally operates. The way in which inherited constitution and early experience interact to produce restraints that act upon and direct learning capacities (i.e., the normal habitat, normal behavior, and the natural choice situation usually encountered) must be studied. 2 sorts of patterns and learning, motoric and perceptual, are used to elucidate these concepts. Imprinting is one sort of perceptual organization that affects subsequent behavior, thus demonstrating the inseparability of motor and perceptual patterns. (28 ref)—*R. S. Albin.*

11316. Vestal, Bedford M. (Oklahoma City Zoo, Animal Research Ctr, OK) **Development of the immobility response (animal hypnosis) in two species of deermice (*Peromyscus*).** *Animal Learning & Behavior*, 1975(Feb), Vol 3(1), 11-15.—Found immobility responses (animal hypnosis) to restraint in a study with 251 prairie and 196 white-footed deermice. Ss were tested cross-sectionally at ages ranging from 11 to 22 days and as adults (60 days). Responses in prairie deermice appeared at 13 days of age and, by 20 days, had increased to approximately adult levels of incidence. In white-footed mice, responses only occurred between 15 and 18 days and as adults. Response incidence was higher in juvenile prairie mice than in white-footed mice, while adults of the 2 species were not different. It is concluded that the developmental pattern of the response in prairie mice is similar to that in birds, but the white-footed mice pattern is different from others reported. (25 ref)—*Journal abstract.*

11317. Walker, Jeanne; Williams, Sharon & Martin, R. Chris. (U Missouri, Kansas City) **The effects of social interaction upon persistence of self-punitive behavior.** *Bulletin of the Psychonomic Society*, 1974(Oct), Vol 4(4-B), 423-425.—Trained 82 Holtzman-derived male rats to escape shock in a straight runway prior to institution of punishment conditions in an attempt to assess the effect of the presence of another S upon the persistence of self-punitive behavior. All rats first received the usual 35 shock escape training trials. Then, during extinction when no shock was present in the goalbox or startbox, Ss were put into 1 of 4 groups: punished, nonpunished, punished with a naive S, and punished with another punished S. Results show that punishment produced self-punitive behavior and that the presence of another S

decreased the number of trials a punished S would perform. The presence of a naive S had more effect than the presence of a trained S. Results are discussed in terms of generalization decrement, social interaction, and fear.—*Journal abstract.*

11318. White, K. Geoffrey. (Victoria U Wellington, New Zealand) **Temporal integration in the pigeon.** *British Journal of Psychology*, 1974(Aug), Vol 65(3), 437-444.—Examined temporal integration in 6 adult pigeons in the context of a procedure which required the S to integrate information from successively presented stimuli in order to make a correct choice. If 2 previous stimuli presented successively on the center key of 3 response keys were the same, a response to the left key was reinforced, whereas if they were different, a right-key response was reinforced. Thus, a correct response could only be made on the basis of abstracting a relationship between temporally separated stimuli. Results show that not only were the Ss able to integrate temporally, but also, their ability to do so decreased as the blackout interval separating the successive stimuli was increased. (30 ref)—*Journal abstract.*

11319. Williams, Ben A. (U California, San Diego) **The role of local interactions in behavioral contrast.** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 543-545.—In a study with 6 mixed-breed pigeons, typical behavioral contrast effects were obtained using a multiple variable-interval (VI) extinction schedule of reinforcement. Response rate was higher, however, during VI components preceded by a VI component than during a VI component preceded by extinction. This effect, contrary to previous findings concerning sequential effects, challenges recent interpretations of behavioral contrast derived from the literature on autoshaping.—*Journal abstract.*

11320. Wood, Keith A. & Willis, Richard D. (U Florida) **Reinforcer and ratio requirement effects in concurrent fixed-interval fixed-ratio schedules.** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 541-543.—In an experiment with 2 male Long-Evans hooded rats, the fixed-ratio requirement was varied in concurrent fixed-interval-fixed-ratio (FI-FR) schedules. FR responding was reinforced by food. In different phases, FI responding was reinforced by food and water. There was an inverted U relationship between the ratio requirement and ratio response rates. There was a direct relation between the ratio requirement and interval response rates when both responses were reinforced with food, but only minimal relational effects when the reinforcers were different. The role of reinforcers in concurrent schedules merits detailed study.—*Journal abstract.*

11321. Wyrwicka, Wanda. (U California, Medical School, Los Angeles) **The sensory nature of reward in instrumental behavior.** *Pavlovian Journal of Biological Science*, 1975(Jan-Mar), Vol 10(1), 23-51.—Presents a theory in which improvement in the sensory state, or "better-being," achieved either through obtaining desirable sensations or through escaping undesirable sensations, is considered the essential value which maintains instrumental behavior. This value may vary depending on such factors as the intensity of the stimulus-producing sensations, the effects of its previous occurrence, and changes in the internal and external environment.

Methods of evaluating sensory "better-being" by means of measuring instrumental, autonomic, and EEG responses are discussed. (108 ref)—*Journal abstract.*

### Social & Sexual Behavior

11322. Anzenberger, Gustl. (Max-Planck-Inst für Verhaltensphysiologie, Seewiesen, W Germany) **[The first appearance of sex-specific parts in duetting young *Trachyphonus d'arnaudii emini*.]** (Germ) *Zeitschrift für Tierpsychologie*, 1974(Apr), Vol 34(4), 395-397.—Describes calls of young barbets of both sexes raised in captivity. During the first months of life they produced exclusively male calls. The young females could, therefore, not be recognized acoustically. Siblings of the same brood failed to duet with each other even after a young female had answered a strange male several times with her sex-specific song. It is suggested that this mechanism might have significance as an incest barrier.—*English summary.*

11323. Barash, David P. (U Washington) **Behavioral individuality in the Cichlid fish, *Tilapia mossambica*.** *Behavioral Biology*, 1975(Feb), Vol 13(2), 197-202.—Evaluated and demonstrated behavioral individuality with regard to courtship and aggression among 7 males of the Cichlid fish, *Tilapia mossambica*, and their male offspring. Individuals fell into natural categories within which behavioral differences were not apparent, suggesting a behavioral polymorphism. These categories appear to represent heritable discontinuities; possible ways in which these polymorphisms are maintained are discussed.—*Journal abstract.*

11324. Brain, Paul & Poole, Angela. (University Coll Swansea, Wales) **Some studies on the use of "standard opponents" in intermale aggression testing in TT albino mice.** *Behaviour*, 1974, Vol 50(1-2), 100-110.—Agonistically naive, 40-day-old male mice were used as "standard opponents" in 3 experiments on aggression. Exp I matched castrated against intact males, Exp II evaluated the effects of previous fighting experience, and Exp III controlled for previous exposure to the fighting arena. It was found that castrated standard opponents were less effective in eliciting fighting than intact Ss, that aggressive behavior exhibited the greatest increment between the 1st and 2nd fights, and that familiarization with the fighting area did not affect measures of aggressive behavior. The advantages of the standard opponent technique for research on aggression are discussed. (French summary) (21 ref)—S. R. Goldstein.

11325. Brain, Paul. (University Coll Swansea, South Wales) **What does individual housing mean to a mouse?** *Life Sciences*, 1975(Jan), Vol 16(2), 187-200.—Reviews recent studies relating the effects of isolation and group housing to behavior, physiology, and neurochemistry in laboratory rats and mice, and relates these accounts to comparable information derived from experiments employing social stresses (e.g., subjecting the animal to defeat). The problem of whether individual housing constitutes a stress (in terms of adrenocortical and adrenal medullary functioning) in these species, as it appears to do in primates, is discussed. In spite of the large number of papers which ascribe the behavioral and endocrine changes obtained in isolation vs grouping comparisons to the effects of "the isolation-induced

stress syndrome," it is concluded that, in terms of adrenal function, there is little evidence that isolation per se constitutes a stress in rats and mice. It should be noted that the wild progenitor of the laboratory strains of house mouse often appears to evidence territoriality. The view is advanced that the isolated condition in male mice may result in changes characteristic of territorial dominance. This may represent a mechanism for inducing social or territorial stability in this species. It appears that experiments involving physical isolation in laboratory rodents are unlikely to provide good models for the effects of social deprivation in man. (144 ref)—*Journal abstract*.

11326. D'Souza, Frances & Martin, Robert D. (Zoological Society of London, Wellcome Inst of Comparative Physiology, England) **Maternal behaviour and the effects of stress in tree shrews.** *Nature*, 1974(Sep), Vol 251(5473), 309-311.—Observed the suckling behavior of 3 tree shrew species in the subfamily *Tupaia*nae. Some of the laboratory findings indicate that 2 of the species exhibit 48-hr suckling intervals while rearing their young in separate nest-boxes. The milk given by the mother is high in protein, caloric density, and fat caloric content. Each suckling visit by the mother is short, and although the amount of milk given increases with the infant's body size, the duration of the visit decreases. Tests made to determine what conditions would affect maternal behavior revealed that sudden loud noises produced marked disruption in the suckling patterns, while removing the infants from the nest-box between suckling periods produced no effect. It is concluded that the 48-hr suckling rhythm is typical of several members of the *Tupaia*nae maintained under relatively stress-free conditions. (17 ref)—*A. de la Haba*.

11327. Davis, Roger E. & Pilotte, Nancy J. (U Michigan, Mental Health Research Inst, Neurosciences Lab) **Attraction to conspecific and nonconspecific chemical stimuli in male and female *Macropodus opercularis* (Teleostei, Anabantoidei).** *Behavioral Biology*, 1975(Feb), Vol 13(2), 191-196.—9 male and 9 female socially isolated *Macropodus opercularis* showed a distinct approach response to water taken from the tank of a conspecific individual or a nonconspecific, *Trichogaster trichopterus*, but not to water from a tank without fish. It is proposed that these species produce chemical stimuli which are attractive to *M. opercularis*. Approach frequency and the total duration of approach during a 10-min period of stimulation varied with the species and the sex of the stimulus fish but not with the sex of the S. Ss responded most frequently to the conspecific male and nonconspecific female stimuli and least to the nonconspecific male stimuli.—*Journal abstract*.

11328. Dunbar, R. I. & Dunbar, Patsy. (U Bristol, England) **Behaviour related to birth in wild Gelada baboons (*Theropithecus gelada*).** *Behaviour*, 1974, Vol 50(1-2), 185-191.—Describes behavior during and after parturition in free-living baboons in the Simien Mountains National Park, Ethiopia. One female was observed giving birth while 3 others were observed within a few hours of parturition. The observed birth occurred when the female suddenly stood up in a half crouching position, uttered a staccato cough and gave birth, the neonate falling to the ground beneath her. Discussion

concerns the similarity of baboon mother-neonate interactions to those observed in other old world monkeys. (German summary)—*S. R. Goldstein*.

11329. Dyer, David P. & Southwick, Charles H. (Johns Hopkins U, School of Hygiene & Public Health) **A possible sensitive period for juvenile socialization in mice.** *Behavioral Biology*, 1974(Dec), Vol 12(4), 551-558.—Provided juvenile male CFW mice with 3 days of social experience with male partners of the same age and treatment group as themselves. They were isolated at all other times between weaning (21 days of age) and adulthood (42 days of age). When the Ss were tested at 42-47 days of age, it was found that those which had received social experience at 27-30 and 30-33 days of age showed less wounding and a greater tendency to sleep together than Ss which had received an equal amount of social experience at an earlier or later age.—*Journal abstract*.

11330. Eppe, Gisela. (U Pennsylvania, Monell Chemical Senses Ctr) **Olfactory communication in South American primates.** *Annals of the New York Academy of Sciences*, 1974(Sep), Vol 237, 261-278.—Reviews research on chemical communication in 2 species of marmoset monkeys. Messages facilitating the identification of species, of sex, of the individual, of reproductive condition, of social status, and of aggressive behavior are discussed. The results of experiments pertaining to these various messages are summarized. It is concluded that many neotropical primates use chemical signals in conflicts between members of the same social group and in intergroup encounters. The control of intraspecific aggression is considered to be the most important function of chemical signals in South American primates. (56 ref)—*R. S. Albin*.

11331. Erwin, J. & Mitchell, G. (U California, Davis) **Initial heterosexual behavior of adolescent rhesus monkeys (*Macaca mulatta*).** *Archives of Sexual Behavior*, 1975(Jan), Vol 4(1), 97-104.—Describes the 1st heterosexual encounters of 12 3-yr-old rhesus monkeys, 6 of each sex. The Ss were all laboratory-born and were reared in wire cages for the 1st 8 mo of life, accompanied only by their mothers. After these animals were weaned, each was placed in a cage with another animal of the same age and sex. The pairs formed in this way remained intact until the animals were 2 yrs old. When heterosexual dyads were formed, some of the Ss attacked and bit the animal with which they had been paired, while the members of other pairs established almost immediate rapport as evidenced by mutual grooming and adequate sexual behavior. The initial sexual interactions of most pairs were uncoordinated, but all eventually demonstrated qualitatively species-typical patterns of sexual behavior. Despite their immaturity, 2 of these pairs succeeded in producing offspring, both of which were healthy. (17 ref)—*Journal abstract*.

11332. Evans, Roger M. (U Manitoba, Winnipeg, Canada) **Responsiveness of young herring gulls to adult "mew" calls.** *Auk*, 1975(Jan), Vol 92(1), 140-143.—Tested preferences of young herring gulls for mew calls from 3 other gull species. Results suggest that adaptive radiation of the parent-young acoustical communication system in this group has occurred largely by adaptive

variations in the calls of the adults relative to the more stable response tendencies of the young.

11333. **Flandera, V. & Nováková, V.** (Czechoslovak Academy of Sciences, Inst of Physiology, Prague) **Effect of mother on the development of aggressive behavior in rats.** *Developmental Psychobiology*, 1975(Jan), Vol 8(1), 49-54.—Conducted 2 experiments with a total of 81 male Wistar rats and 64 rat pups. It was found that 23-day-old Ss that were offspring of aggressive parents attacked mice. They killed them, however, only if the mother had already killed mice in their presence. Rats 30 days of age killed mice spontaneously without any previous exposure to killing. The occurrence of muricide activity in young Ss of this age was the same as in the adult population. If offspring of aggressive parents were reared by nonaggressive foster mothers from birth, they did not exhibit the muricide reaction at 30 days. In adulthood, however, the reaction appeared to the same extent as in the offspring of aggressive parents reared by aggressive mothers. If the descendants of nonaggressive parents were reared by aggressive foster mothers from birth, 64.7% of them killed mice at age 30 days. This aggression was retained in equal intensity during adulthood and could not be attributed to specific learning in that the mothers had never encountered a mouse in the presence of their foster young. (18 ref)—*Journal abstract*.

11334. **Gosow, Hartmut & Schürholz, Götz.** (U Freiburg, Faculty of Forestry, W Germany) **Social aspects of wallowing behaviour in red deer herds.** *Zeitschrift für Tierpsychologie*, 1974(Apr), Vol 34(4), 329-336.—Observed that, outside the rutting season, wallowing behavior correlated with rank order position and/or age group (judged by antler size). Rank order patterns usually become apparent, especially under ecologically limited conditions. Wallowing behavior seemed to improve social integration of younger herd members and to synchronize herd activities. (German summary) (15 ref)—*Journal summary*.

11335. **Gottlieb, Gilbert.** (Dorothea Dix Hosp, Raleigh, NC) **On the acoustic basis of species identification in wood ducklings (*Aix sponsa*).** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1038-1048.—Tested the hypothesis that frequency modulation is an important feature of the acoustic basis of species identification by synthesizing a call that was as attractive to maternally naive wood ducklings as the natural wood duck maternal call itself. 3 experiments were performed with over 250 wood ducklings hatched in the laboratory from eggs collected in the wild. The critical acoustic feature of the wood duck maternal call is a descending frequency modulation. It is suggested that the attractiveness of the wood duck maternal call to maternally naive ducklings derives, at least partially, from prior exposure of the ducklings to their own embryonic vocalizations, each of which is composed of a very pronounced descending frequency modulation. (15 ref)—*Journal abstract*.

11336. **Goyens, Jacqueline & Noirot, Eliane.** (U Brussels, Lab of Experimental Psychology, Belgium) **Effects of cohabitation with females on aggressive behavior between male mice.** *Developmental Psychobiology*, 1975(Jan), Vol 8(1), 79-84.—Observed individual male mice of several groups ( $N = 108$ ) during daily

encounters with a male intruder. The groups differed with regard to social and sexual experience of the resident S and of the intruder. Aggressive behavior was most intense in residents actually living with a female and least intense in sexually naive residents living alone. Residents that had only cohabited with a female for a short time obtained intermediate scores. Experienced intruders were attacked less than naive ones. (22 ref)—*Journal abstract*.

11337. **Harmatz, Paul; Boelkins, R. Charles & Kessler, Seymour.** (Stanford U, Medical School) **Postisolation aggression and olfactory cues.** *Behavioral Biology*, 1975(Feb), Vol 13(2), 219-224.—15 socially isolated DBA/2J male mice chronically subjected to soiled bedding from 15 group-housed males showed less aggressivity than 2 groups of 15 isolates subjected either to soiled bedding from other isolated males or to fresh bedding. Findings suggest that postisolation aggression in mice may result from the gradual disinhibition from a primer pheromone, present in groups of male mice, which acts to suppress aggressive attack. (21 ref)—*Journal abstract*.

11338. **Hendricks, D. Paul.** **Copulatory behavior of a pair of yellow-billed cuckoos.** *Auk*, 1975(Jan), Vol 92(1), 151.—Describes an instance of copulatory behavior in yellow-billed cuckoos which involved the male placing a twig in the female's mouth during coition, removing it and flying away, and then repeating the entire sequence. Suggestions for the function of the twig (e.g., as a tool to maintain balance) are presented.

11339. **Jarvis, M. J. & Ettlinger, G.** (Inst of Psychiatry, London, England) **Transfer of spatial alternation between responding in the light and in the dark.** *Neuropsychologia*, 1975(Jan), Vol 13(1), 115-116.—Substantial savings in 2nd modality performance were found in rhesus monkeys trained on spatial alternation in the light and in the dark, supporting evidence from lesion studies that the cortical area concerned with spatial alternation, the frontal cortex, is organized so that information regarding modality of sensory inflow is not critical for mediating behavior as it is for behavior mediated by infero-temporal and parieto-prestriate regions.

11340. **Krischik, Vera A. & Weber, Peter G.** (Lake Ontario Environmental Lab, Oswego, NY) **Induced parental care in male convict cichlid fish.** *Developmental Psychobiology*, 1975(Jan), Vol 8(1), 1-11.—Recorded 3 parameters of parental care for pairs of cichlid fish caring for their own young to determine the normal parental role of the male. Nonreproductive adult males were induced to exhibit parental behavior (e.g., herding, fin-digging, and defense of young) by daily presentation of free-swimming conspecific young. This process of sensitization to young appears to be species-specific in that males did not exhibit parental care toward alien (*Hemichromis bimaculatus*) young. Parental behavior in reproductive and nonreproductive males, as well as the implications and function of sensitization in these fish, is discussed. (31 ref)—*Journal abstract*.

11341. **Lee, M. H. & Williams, D. I.** (U Hull, England) **Long term changes in nest condition and pup grouping following handling of rat litters.** *Developmental Psychobiology*, 1975(Jan), Vol 8(1), 91-95.—Results of

observation of litters born to 15 black-hooded rats over the entire preweaning period reveal long-term changes to result from handling pups. Handled litters had fewer good nests and were less likely to be found in a single group than control litters. These differences are not attributable to the disturbance per se, as litters where the mother was removed did not differ significantly from undisturbed controls. The differences occurred predominantly in the daytime when maternal activity was at its lowest. (16 ref)—*Journal abstract*.

11342. Lenington, Sarah & Mace, Terry. (U Chicago) **Male fidelity and nesting site tenacity in the Killdeer.** *Auk*, 1975(Jan), Vol 92(1), 149-151.—Presents banding, mate fidelity, site tenacity, and comparative data from 30 pairs of Killdeer which indicate that male Killdeer have a greater tendency to return to previous breeding sites than do females, and that for some species of plovers there may be a higher probability that males will be nesting within the censusing areas than will females.

11343. McNicholl, Martin K. (U Alberta, Edmonton, Canada) **Larid site tenacity and group adherence in relation to habitat.** *Auk*, 1975(Jan), Vol 92(1), 98-104.—A review of the literature indicates that nest site tenacity is strongly developed in larids in highly stable habitats. In highly unstable habitats, site tenacity is necessarily greatly reduced, and group adherence assists rapid pioneering of newly suitable habitat. In fluctuating marshes and prairie lakes, group adherence and reduced site tenacity allow rapid colonization of newly suitable habitat, while the maintenance of at least a weak form of site tenacity allows rapid recolonization of previously used sites. (54 ref)—*Journal abstract*.

11344. Michael, Richard P.; Wilson, Margo I. & Zumpe, D. (Emory U, Medical School) **The bisexual behavior of female rhesus monkeys.** In R. C. Friedman, R. M. Richart, R. L. Vande Wiele & L. O. Stern (Eds), *Sex differences in behavior*. New York, NY: John Wiley & Sons, 1974. xvi, 495 p.

11345. Moyer, Kenneth E. (Carnegie-Mellon U) **Sex differences in aggression.** In R. C. Friedman, R. M. Richart, R. L. Vande Wiele & L. O. Stern (Eds), *Sex differences in behavior*. New York, NY: John Wiley & Sons, 1974. xvi, 495 p.

11346. Mulder, J. B. (Michigan State U) **Bedding preferences of a pregnant laboratory-reared male.** *Behavior Research Methods & Instrumentation*, 1975(Jan), Vol 7(1), 21-22.—20 pregnant ARS Ha (ICR) Swiss mice were allowed to select from 10 commercially available bedding products for parturition and rearing young. Combinations of bedding materials were most often selected, and products of wood origin were overwhelmingly preferred. Rates for the selection of bedding materials from the 20 tests were Aspen Bed 100%, Cedar Shavings 75%, Pinewood Shavings 45%, Ab-Sorb-Dri 5%, and Stop "O" 5%.—*Journal abstract*.

11347. Navarro, Jose & del Solar, Eduardo. (U Austral de Chile, Inst of Ecology, Valdivia) **Pattern of spatial distribution in *Drosophila melanogaster*.** *Behavior Genetics*, 1975(Jan), Vol 5(1), 9-16.—Studied the effect of temperature and sex on spatial distribution of *Drosophila melanogaster* adults in a specially designed apparatus. It was observed that individuals tend to aggregate in sections of the sphere independently of sex and tempera-

ture. Nevertheless, a decrease in temperature increased aggregation. The mobility of both males and females indicates a negative geotactic tendency. Results may indicate a mechanism of social interaction that makes different individuals group together and may also have implications for the biological meaning of gregarious behavior. (16 ref)—*Journal abstract*.

11348. Poduschka, Walter. [On the mating behavior of the large Madagascar hedgehog (*Setifer setosus*, Froriep 1806) and the phylogenetic age of some of its elements.] (Germ) *Zeitschrift für Tierpsychologie*, 1974(Apr), Vol 34(4), 345-358.—Observed and filmed mating behavior of several hedgehogs for 2 yrs. The precopulatory behavior of *Setifer* is less ritualized than that of rice ternecs, but shows some similarities to that of the long-eared hedgehog. Stimulatory scratching with the hind legs and short contact bites apparently both serve to induce the female to present her genitalia better and to fasten the perineal contact. Form and function of the penis in action and its rodlike glans are described. Mating ordinarily lasts more than 2 hrs. Ultrasonic signals, eye secretions, form and function of the penis, and stimulatory scratching seem to be phylogenetically old elements of the mating behavior. (47 ref)—*English summary*.

11349. Rearden, John J. (Eastern Illinois U) **Dominance and aggression in the Mongolian gerbil (*Meriones unguiculatus*).** *Psychological Reports*, 1974(Dec), Vol 35(3), 1346.—Studied 2 generations of Mongolian gerbils to examine their natural aggression and dominance. Dominant males, removed from the colony for 1 wk, were attacked when returned; less dominant males would attack intruders when alpha was removed.

11350. Rosenbaum, Leonard A. (State U New York, Downstate Medical Ctr, Primate Behavior Lab, Brooklyn) **Sex differences in mother-infant attachment in monkeys.** In R. C. Friedman, R. M. Richart, R. L. Vande Wiele & L. O. Stern (Eds), *Sex differences in behavior*. New York, NY: John Wiley & Sons, 1974. xvi, 495 p.

11351. Scott, J. P.; Stewart, John M. & de Gheet, Victor J. (Bowling Green State U) **Critical periods in the organization of systems.** *Developmental Psychobiology*, 1974(Nov), Vol 7(6), 489-513.—Analyzed the critical period for primary socialization (social attachment) in a dog. Evidence that attachment had taken place consisted of discriminative behavior in relation to familiar and unfamiliar objects and rested on a minimum of 3 processes: (a) organization of the separation distress response, (b) visual and auditory sensory capacities, and (c) long-term associative memory capacities. Once these capacities were developed, the overall attachment process proceeded very rapidly. It is suggested that the critical periods for the organizational subprocesses precede or slightly overlap that for the overall process, and that the theory of critical periods is a general one that should apply to any developmental organizational process which proceeds at grossly different rates at different times. (36 ref)—*Journal abstract*.

11352. Sloan, Lloyd R. & Latané, Bibb. (U Notre Dame) **Social deprivation and stimulus satiation in the albino rat.** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1148-1156.—Conduct-

ed 2 experiments, with a total of 288 male Sprague-Dawley albino rats, to explore the mechanisms whereby social deprivation leads to increased sociability in rats. Exp I housed Ss alone or in pairs with additional nonsocial stimulation, with additional response opportunities, or with no added social surrogates for 3 wks prior to testing for sociability. Social deprivation led to a strong increase in sociability, and this was not ameliorated by stimulus or response enrichment. Exp II exposed alone or pair-housed Ss to handling, human contact, or no stimulation and found that human exposure did serve a social surrogate function. This result suggests that sociability in rats represents to some degree a search for complex and unpredictable stimulation. (25 ref)—*Journal abstract*.

11353. Syme, G. J.; Syme, L. A. & Kevey, W. (U Western Australia, Nedlands) **The peck order and performance in three competitive situations by a small flock of pullets.** *Behavioral Biology*, 1975(Feb), Vol 13(2), 257-262.—Investigated relationships between peck order and behavior in 3 different food competition situations with a flock of 8 White Leghorn  $\times$  Australorp pullets. Low correlations were observed between peck order and performance in all competitive tasks and between scores on the 3 competitive measures. Implications of these findings are discussed in terms of the use of the concept "social dominance" to describe social behavior in domestic fowl.—*Journal abstract*.

11354. Watton, David G. & Keenleyside, Miles H. (Ontario Ministry of Natural Resources, Wildlife Branch, Toronto, Canada) **Social behaviour of the Arctic ground squirrel: *Spermophilus undulatus*.** *Behaviour*, 1974, Vol 50(1/2), 77-99.—Studied the social behavior of Arctic ground squirrels living in small groups in an outdoor enclosure, using descriptive and analytic techniques (release and recapture experiments). Agonistic encounters were characterized by a variety of mutual pushing postures exhibiting sequential dependencies. In release experiments males acquired territories before females, and heavy animals acquired territories before lighter animals. Size was not a factor when prior residency was established. The adaptive significance of these findings, particularly as they relate to rearing of young, is discussed. (German summary) (31 ref)—S. R. Goldstein.

### Sensory Processes

11355. Cowey, Alan & Weiskrantz, Lawrence. (U Oxford, England) **Demonstration of cross-modal matching in rhesus monkeys, *Macaca mulatta*.** *Neuropsychologia*, 1975(Jan), Vol 13(1), 117-120.—By using edible and inedible shapes presented first in darkness then in the inedible shapes presented first in darkness then in the light to rhesus monkeys, it was possible to demonstrate cross-modal matching from touch to vision. The result shows that cross-modal matching is not unique to apes and human beings. (French & German summaries)

11356. Govindarajan, S. & Rajulu, G. S. (PSG Coll of Technology Campus, U Extension Ctr, Coimbatore, India) **Presence of resilin in a scorpion *Palamnaeus swammerdami* and its role in the food-capturing and sound-producing mechanisms.** *Experientia*, 1974, Vol 30(8), 908.—Studied the elastic cuticular hinge in a scorpion that permits opening and closing of the chela

necessary for grasping food. It is concluded that this cuticle contains a protein resembling resilin whose inherent property is regaining its original condition after being pulled out or extended. Thus, the occurrence of a protein resembling resilin may aid in the operation of the scorpion's sound-producing and food-capturing mechanisms. (German summary)

11357. Grant, G. G. (Canadian Forestry Service, Insect Pathology Research Inst, Sault Ste Marie, Ontario) **Male sex pheromone from the wing glands of the Indian meal moth, *Plodia interpunctella* (Hbn.). (Lepidoptera: Phycitidae).** *Experientia*, 1974, Vol 30(8), 917-918.

11358. Kovach, Joseph K. (Menninger Foundation, Topeka, KS) **Early color preferences in the coturnix quail.** *Journal of Comparative & Physiological Psychology*, 1974(Dec), Vol 87(6), 1049-1060.—Color preferences within 6 paired combinations of the 4 primary colors were tested in 3,039 quail chicks by a binomial mass-screening procedure. The procedure resulted in highly reliable preference estimates for the middle range (green and yellow) over the extreme portions (blue and red) of the color spectrum and for the shortest over the longest wavelength (blue over red). Identified preferences were shown to be independent of objective or subjective intensity differences of colors and were also significantly different from each other in terms of their within-trait phenotypic variations.—*Journal abstract*.

11359. Morse, Philip A. & Snowden, Charles T. (U Wisconsin, Madison) **An investigation of categorical speech discrimination by rhesus monkeys.** *Perception & Psychophysics*, 1975(Jan), Vol 17(1), 9-16.—Examined the discrimination of synthetic human speech sounds by 8 monkeys, using the cardiac component of the orienting response. A within-category change which consisted of stimuli differing acoustically in the onset of F2 and F3 transitions, but which are identified by humans as belonging to the same phonetic category, were responded to differently from a no-change control condition. Stimuli which differed by the same amount in the onset of F2 and F3 transitions, but which human Os identify as belonging to separate phonetic categories, were differentiated to an even greater degree than the within-category stimuli. Results provide ambiguous data for an articulatory model of human speech perception and are interpreted instead in terms of a feature-detector model of auditory perception. (37 ref)—*Journal abstract*.

11360. Sabbot, Irene & Costa, A. (U California, Brain Research Inst, Los Angeles) **Cold stress induced changes in the uptake distribution of radiolabelled magnesium in the brain and pituitary of the rat.** *Experientia*, 1974, Vol 30(8), 905-906.—Studied the effects of cold stress conditions on the uptake of radiolabelled magnesium by certain brain areas and by the pituitary gland in 64 white male rats (1/2 control and 1/2 experimental). Such stress produced an increase in magnesium uptake levels in the cortex. Results are explained with reference to changes in the permeability of the blood-brain and blood-pituitary barriers for magnesium that are induced by cold-stress. (French summary)

11361. Schuijff, A. & Siemeling, M. E. (Lab of Comparative Physiology, Utrecht, Netherlands) **The**

**ability of cod (*Gadus morhua*) to orient towards a sound source.** *Experientia*, 1974, Vol 30(7), 773-775.—Investigated the ability of the cod to determine the direction of a sound. A netted device with 4 possible corridors from which a 75 Hz sound could be generated was suspended into a fjord. The S was conditioned to swim in the corridors and rewarded at a feeding station in line with the active sound source. Results indicate that the S was able to determine a sound's direction. An operation was performed to sever the nerve roots innervating the pars inferior of the left labyrinth. Results indicate that the cooperation of both labyrinths is involved in directional hearing. (German summary)—*R. Tomasko*.

11362. **Wasserman, Gerald S.** (U Wisconsin, Madison) ***Limulus* psychophysics: Dark adaptation in the ventral eye.** *Journal of Experimental Psychology: Human Perception & Performance*, 1975(Feb), Vol 104(1), 68-76.—Notes that sudden illumination applied to *Limulus* produces an unconditioned downward tail movement which is under stimulus control and can be used to measure psychophysical thresholds. The method of constant stimuli was used to measure the behavioral dark-adaptation function mediated by the ventral eye of *Limulus*. The resulting function has 2 phases, each of which is rectified when log threshold is made a function of log time in the dark. Under the conditions of the present experiment, the transition between the 2 phases occurred at 6 min. Results are based on data derived from 8 animals. This psychophysical dark-adaptation function has the same form as an electrophysiologic dark-adaptation function obtained by A. Fein and R. D. DeVoe in 1973 (using the ventral eye receptor potential as the response). In more complex visual systems such 2-phase, dark-adaptation functions would usually be interpreted in terms of screening pigment movements or changes in the neural contributions of different receptor classes, but neither interpretation is appropriate for the ventral eye of *Limulus*.—*Journal abstract*.

11363. **Wegener, Jonathan G.** (Indiana U) **Interaural intensity and phase angle discrimination by rhesus monkeys.** *Journal of Speech & Hearing Research*, 1974(Dec), Vol 17(4), 638-655.—Trained 9 pre- and postadolescent macaques to perform 3 auditory discriminations, which required that they press the right-hand key when the auditory stimulus was present in the right ear, and the left-hand key when the stimulus was presented to the left ear. Monaural thresholds for 18 ears averaged 14.7 db sound-pressure level. Interaural intensity difference thresholds for the same Ss had a mean of 2.7 db. Interaural phase angle difference thresholds were determined for 7 of the Ss. The mean threshold was 9.7°, equivalent to a temporal difference of 53  $\mu$ sec. (30 ref)—*Journal abstract*.

## DEVELOPMENTAL PSYCHOLOGY

11364. **Bench, John; Langford, Cheryl & Wilson, Ian.** (Royal Berkshire Hosp, Reading, England) **Some effects of prestimulus activity and length of prestimulus observation on judgments of infants' auditory behavior.** *Audiology*, 1975(Mar-Apr), Vol 14(2), 164-172.—The auditory responses of 9 6-wk-old and 10 6-mo-old

infants were assessed subjectively by a group of 4 experienced female Os. Infants' responses were evaluated as a function of prestimulus activity level and of duration of prestimulus observation. Response assessment for both ages was significantly affected by the 1st but not by the 2nd. The percentage of responses for both ages tended to decrease with increasing prestimulus activity state. Findings are compared with the similar study of C. Langford et al (1975) on neonates. (French summary)—*Journal abstract*.

11365. **Biller, Henry B.** (U Rhode Island) **Paternal and sex-role factors in cognitive and academic functioning.** *Nebraska Symposium on Motivation*, 1973, Vol 21, 83-123.—Discusses studies which made qualitative and quantitative analyses of sex-role development and father-child relationships in the child's cognitive and academic behavior. Mothers were found more tolerant than fathers toward intellectually handicapped children, especially sons. Higher father availability and less parental deprivation were found related to high academic performance, particularly if the father enjoyed intellectual activities. Daughters also benefited from father availability and his intellectual pursuits in terms of greater autonomy, independence, creativity, and achievement. Strong mother figures tended to produce higher verbal skills but lower levels of independence and assertiveness in sons. Children's reactions to male vs female teachers are discussed. (146 ref)—*J. M. Roberts*.

11366. **Birns, Beverly.** (State U New York, Stony Brook) **Piaget and Wallon: Two giants of unequal visibility.** *International Journal of Mental Health*, 1972-1973(Win), Vol 1(4), 24-28.—Compares J. Piaget's contributions to developmental psychology with those of H. Wallon. Piaget's theory, which emphasizes the classification of cognitive development and learning through action, with an experimental approach, received rapid recognition because of the influence of Freud's theories and public interest in child development. By contrast, Wallon's clinical approach and his emphasis on interaction between cognitive and emotional development has been recognized only recently, because of its congruence with modern social learning theories which emphasize how much behavior can be learned on the basis of imitation. Wallon's theory is concordant with the premise that who and what are imitated are related to the child's feelings about the class of people that he imitates. Piaget's researches tend to be experimental; Wallon's are more clinical and they do not focus on one particular dimension.—*A. H. Alawi*.

11367. **Cassel, Russell N. (Ed.).** (Project Innovation, Chula Vista, CA) **Critical contributions of Piaget to developmental psychology.** In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.—Considers the nucleus of Piaget's entire history of investigation to be the concept of genetic epistemology and discusses his definition of the process of adaptation in relation to the present understanding of learning theory. 5 areas involved in Piaget's concept of learning—maturation, experience

with environment, teachings, equilibration, and cultural norms—are outlined.

11368. Cortial, Christiane & Lézine, Irène. (Port Royal Hosp, Paris, France) **Comparative study of nutritive sucking in the newborn (premature and full-term).** *Early Child Development & Care*, 1974, Vol 3(3), 211-228. —Describes an analysis of sucking patterns in premature infants. The rhythm is disorganized compared to that of normals and is related to the difficulties in space orientation found in older prematurely born children. The psychoprophylactic importance of individually appropriate feeding procedures is discussed.

11369. Day, R. H. (Monash U, Clayton, Vic, Australia) **Perceptual processes in early infancy.** *Australian Psychologist*, 1974(Mar), Vol 9(1), 15-34. —Reviews research on infant perception during the preceding 4 yrs. Most of the work has involved 3 techniques: (a) operant conditioning with social reinforcement, (b) visual fixation preference, and (c) habituation of visual fixation. A variety of experiments are discussed dealing with discrimination of pattern in infancy, discrimination of orientation, object distance as a determinant of visual fixation, and shape constancy in infancy. The chief conclusion is that the very young infant is prepared for a wide range of perceptual achievements at an early age. (31 ref)—J. C. Figurelli.

11370. DeVito, Pasquale J. (Boston Coll) **An analysis of selected behavioral characteristics of disadvantaged students.** *Journal of Educational Research*, 1975(Jan), Vol 68(5), 178-181. —Investigated sex and grade differences of 193 male and 210 female educationally disadvantaged children, ranging in grade level from kindergarten to Grade 3, on behavioral traits delineated by orthogonal factor analysis. 6 factors were extracted and factor scores used as dependent variables in univariate analyses of variance. Primary results indicate that (a) creativity indices among Ss decreased steadily from kindergarten to Grade 3; and (b) contrary to research conducted with general population Ss, girls in the disadvantaged sample exhibited more aggressive behavior than boys and were no more dependent on the teacher than the boys. Possible explanations and implications are discussed. —Journal abstract.

11371. Draper, Mary W. (Oklahoma State Dept of Health, Oklahoma City) **Play: The pathway to learning.** In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50. —Explores the role of play actions and play objects in the development of the child, especially during the sensorimotor period from birth to approximately 18-24 mo, and in the child's acquisition of skills and concepts (e.g., object permanency, perceptual motion, classification, seriation, and spatial and temporal relationships).

11372. Eimas, Peter D. (Brown U, W. S. Hunter Lab of Psychology) **Auditory and linguistic processing of cues for place of articulation by infants.** *Perception & Psychophysics*, 1974(Dec), Vol 16(3), 513-521. —In 2 experiments a total of 144 2- and 3-mo-old infants discriminated the acoustic cues for the phonetic feature of place of articulation in a categorical manner.

Evidence for the discriminability of 2 synthetic speech patterns was present only when the stimuli signaled a change in the phonetic feature of place. No evidence of discriminability was found when 2 stimuli, separated by the same acoustic difference, signaled acoustic variations of the same phonetic feature. Discrimination of the same acoustic cues in a nonspeech context was found, in contrast, to be noncategorical or continuous. Results are discussed in terms of infants' ability to process acoustic events in either an auditory or a linguistic mode. (37 ref) —Journal abstract.

11373. Galenson, Eleanor & Roiphe, Herman. (Albert Einstein Coll of Medicine, Yeshiva U) **The emergence of genital awareness during the second year of life.** In R. C. Friedman, R. M. Richart, R. L. Vande Wiele & L. O. Stern (Eds), *Sex differences in behavior*. New York, NY: John Wiley & Sons, 1974. xvi, 495 p.

11374. Gove, Walter R. & Herb, Terry R. (Vanderbilt U) **Stress and mental illness among the young: A comparison of the sexes.** *Social Forces*, 1974(Dec), Vol 53(2), 256-265. —The sociological and psychological literature almost uniformly suggests that young males experience more stress than young females, in part because of social expectations and in part because of different rates of biological development and other physiological factors. It also suggests that with advancing age the sex difference in experienced stress tends to disappear, and by late adolescence the situation of females appears to be at least as stressful if not more so than that of males. On the premise that the differences in experienced stress would be reflected in rates of treated mental illness, the national rates of males and females in psychiatric treatment between ages 5 and 19 are compared. Data consistently show preadolescent males to have higher rates of mental illness, while by late adolescence females appear to have as high if not higher rates of mental illness than males. (2 p ref)—Journal abstract.

11375. Hellbrun, Alfred B. (Emory U) **Parent identification and filial sex-role behavior: The importance of biological context.** *Nebraska Symposium on Motivation*, 1973, Vol 21, 125-194. —Examines the complexity of human social responses in an attempt to fill in details omitted by using over-simplified theories and simplistic research tools that have thus far precluded a complete understanding of the antecedents of these responses. The term "congruity" is used to describe the fit between psychological masculinity or femininity and biological maleness or femaleness. Self-assessments on 15 personality variables are compared with the S's ratings of the parents on the same variables. Congruity of the parent identified with bears upon the resultant behavior of the son but not the daughter. 3 possible explanations are offered to explain this result. (56 ref)—J. M. Roberts.

11376. Korner, Anneliese F. (Stanford U, Medical School) **Methodological considerations in studying sex differences in the behavioral functioning of newborns.** In R. C. Friedman, R. M. Richart, R. L. Vande Wiele & L. O. Stern (Eds), *Sex differences in behavior*. New York, NY: John Wiley & Sons, 1974. xvi, 495 p.

11377. Labovitz, Sanford. (U Calgary, Alberta, Canada) **Control over death: The Canadian case.** *Omega: Journal of Death & Dying*, 1974(Fal), Vol 5(3), 217-221.

--Replicated D. J. Phillips's (1969) "death control study" of famous Americans, using famous and nonfamous Canadians. Results support the hypothesis that death rates decrease prior to birth dates and increase after them, with 1 exception—death rates for famous Canadians did not decrease prior to birth dates.

11378. Lubin, Gerald I.; Magary, James F. & Poulsen, Marie K. (Eds.). *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.*

11379. Mencher, George T.; Kushner, Marcia & McCulloch, Barbara. (Hosp for Children, Halifax, Nova Scotia, Canada) **White noise as a pretest sensitizer for neonatal hearing screening.** *Audiology*, 1975(Mar-Apr), Vol 14(2), 152-163.—Tested 450 newborn infants under 18 test conditions which also permitted examination of infant state and criterion stimuli (warble tone vs narrow band noise) as variables. There were 3 pretest conditions: no pretest sensitizer, 90-db pretest sensitizer, and 100-db pretest sensitizer. Each pretest condition was followed by either a 90- or a 100-db criterion stimulus. Analysis concerned an increase in the number and in the strength of the responses. Generally, there was no benefit associated with the use of white noise as a pretest sensitizer. (French summary)—*Journal abstract.*

11380. Moltz, Howard. (U Chicago) **Some implications of the critical period hypothesis.** *Annals of the New York Academy of Sciences*, 1973(Dec), Vol 223, 144-146.—Proposes that the term "critical period" is conceived too broadly and too generally, designating a host of disparate developmental phenomena. It is indiscriminately applied to all behavior patterns whose growth and organization are markedly affected by events typically occurring within a fairly narrow and specific period of development. Inherent in this use of the concept of critical periods in ontogeny is its confusion with the existence of optimal periods for specific learning. Contingent response systems will not develop in the absence of certain investigated stimulus conditions, and critical periods in development exist for these (e.g., imprinting). A noncontingent response system will develop in the absence of environmental events, which, if present, exert a great effect on these responses. Thus, optimal periods exist for their development. It is concluded that the term "critical period" as used by psychologists and ethologists requires conceptual refinement.—R. S. Albin.

11381. Sklar, Mark J. **Is Piaget a developmental or learning theorist?** In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds.), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.*—Discusses Piaget's characterization of intelligence as an adaptive process, arguing that it is clearly evident that his theory of intelligence is, above all, developmental in nature. An analysis of Piaget's developmental theory is presented, and its contribution to learning in today's schools is outlined.

11382. Steiner, J. E. (Hebrew U, Hadassah School of Dental Medicine, Jerusalem, Israel) **Discussion paper: Innate, discriminative human facial expressions to taste and smell stimulation.** *Annals of the New York Academy of Sciences*, 1974(Sep), Vol 237, 229-233.—Summarizes experiments designed to elucidate the gustofacial response—the well-differentiated motor reaction of the facial muscles to adequate stimulation of the peripheral gustatory receptors. Studies described include several utilizing neonate infants (both normal and malformed) less than 16 hrs of age and several testing normal Israeli adults. All displayed the gustofacial response when presented with sweet, sour, and bitter stimuli. The presentation of sweet stimuli is usually followed by a marked relaxation of the facial muscle, retraction of the mouth (smile), and licking and sucking. Bitter stimuli were followed by depression of the mouth angles. In sour stimulation, lips were pursed. These reactions are seen as reflex-like and innate. Reactions to odorant stimuli are also described. It is concluded that food-related odors are discriminated by human infants in the very first hours of life.—R. S. Albin.

11383. Stodolsky, Susan S. (U Chicago) **How children find something to do in preschools.** *Genetic Psychology Monographs*, 1974(Nov), Vol 90(2), 245-303.—Conducted a 2-yr observational study of a total of 81 lower- and middle-class 3-6 yr olds to examine the behavior of young children in school settings which program all or part of the day as "free play" time. Results indicate that with age, children became more effective in moving from one activity to another; they spent less time in transition and longer periods in activity. Behaviors exhibited while in transition became less dependent on the immediate surrounding and seemed to indicate more autonomy. Lower-class boys had shorter activity lengths and more transitions than the other groups. A qualitative description of children's transition behavior is presented and possible implications of the findings for developmental and educational research are discussed. (35 ref)—*Journal abstract.*

11384. Ushiyama, Toshiko. [Facilitation and inhibition factors of choice of "Jan-Ken" behavior in kindergarten children.] (Japn) *Japanese Journal of Educational Psychology*, 1974(Jun), Vol 22(2), 105-109.—Describes the psychological and social significances of "Janken" behavior, which is widely used by Japanese children as a method of deciding a winner.

11385. Wallon, Henri. **The psychological development of the child.** *International Journal of Mental Health*, 1972-1973(Win), Vol 1(4), 29-39.—Traces the psychological development of the child as a continuous transition from concrete to abstract mental organization, from reflex emotionality to intellectualization of emotions, and from pleasure to reality orientation as a function of maturation and learning. Special emphasis is given to the role of play, in which the child repeats the impressions of events he has just experienced; of imitation, language, and cognitive clarity. Emotions are regarded as the underlying basis for the gregarious drives that constitute a rudimentary form of communication and community. Discontinuity in the thought of the child is attributed to inadequate accommodation to an object. The various stages of development are described,

emphasizing that these stages demonstrate unity and interrelatedness. At each stage the child constitutes an indivisible whole "self" capable of further enrichment.—A. H. Alawi.

11386. Watanabe, Hirozumi. (Ehime U, Matsuyama, Japan) [Development of form perception in preschool children: Analysis of manual movements by means of VTR.] (Japn) *Japanese Journal of Educational Psychology*, 1974(Jun), Vol 22(2), 115-119.—Analyzed the videotaped hand movements of Japanese preschool children in relation to the development of form perception. 4 developmental stages were confirmed: inactive, active search, visual search, and simultaneous solution.—S. Choe.

11387. Wels, P. M. & Van den Munckhof, H. C. (Katholieke U, Nijmegen, Netherlands) [The Nijmegen growth study: A mixed longitudinal, multidisciplinary investigation of children 4-14 yrs old.] (Duth) *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1974(Nov), Vol 29(8), 649-667.—Presents the design of the Growth Study of 486 children (232 male and 254 female). Medical, dental, and psychological variables were investigated. The psychological aspects considered were (a) the development of cognitive functions, school progress, and several personal characteristics; (b) the relationships between the psychological and somatic characteristics; (c) the influence of cultural and pedagogical characteristics; (d) the ability to generalize, as identified by test effect; (e) the development of new concepts by the Ss. The measuring instruments used are described. The cross-sectional and longitudinal testing patterns are discussed. (24 ref)—A. J. Ter Keurst.

11388. Wolff, Peter H. (Children's Hosp Medical Ctr, Boston, MA) What Piaget did not intend. In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.—Criticizes interpretations of Piaget's writings which take his observations rather than his theory as a basis for reforming elementary school education. Core concepts from the psychological aspects of Piaget's genetic epistemology are restated, and it is argued that the clinical method which he used to discover universals of intellectual development is just as relevant for classroom teaching.

11389. Zern, David S. (Clark U) An interpretation of the effects of stimulation on development: Its role as a resolvable disequilibrating. *Genetic Psychology Monographs*, 1974(Nov), Vol 90(2), 325-347.—Reviews literature which demonstrates that stimulation helps to foster development, although there have been no uniformly accepted interpretations of the relevant data. An explanation is offered which argues that stimulation is experienced by the organism as an unpleasant and frustrating intrusion and not as something enjoyable. The organism is motivated to achieve appropriate skills in order to eliminate the stimulation, thus resolving the disequilibrium that has been created. Evidence supporting this thesis is presented both from laboratory experiments of animals and systematic examination of human offspring in their homes and in institutional

settings in a variety of societies. (47 ref)—*Journal abstract*.

### Cognitive & Physical Development

11390. Bauer, Richard H. (U California, Los Angeles) Developmental and intellectual changes in serial recall of repeated and nonrepeated digit sequences. *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 121.

11391. Baylor, George W. & Lemoyne, Glisele. (U Montréal, Québec, Canada) Experiments in seriation with children: Towards an information processing explanation of the horizontal décalage. *Canadian Journal of Behavioural Science*, 1975(Jan), Vol 7(1), 4-29.—Tested 37 5-10 yr olds on 3 seriation tasks: length, weight, and a specially constructed "hidden length" seriation designed to eliminate the typically observed horizontal décalage between the length and weight tasks. Results confirm the main hypotheses: the hidden length seriation was more difficult than the normal length seriation and of approximately equal difficulty to the weight seriation. An information-processing analysis was then carried out with 1 8-yr-old S at the operational level of cognitive development. This led to the construction of a performance model, a computer program cast as a set of production rules, that simulated in detail the S's behavior on the 3 tasks. The general and task specific elements of the program show how the length seriations are facilitated by perceptual factors and the organization of memory, though within the framework of a common insertion strategy that the S employed on all 3 tasks. (French summary) (22 ref)—*Journal abstract*.

11392. Brislaw, Ferdinand L. (Piedmont Unified School District, Special Education Services, CA) Space representation and language development. In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.

11393. Carlson, Jerry S. & Goldman, Roy D. (U California, Riverside) The relationship between multiplicative classification and inductive reasoning. *Journal of Genetic Psychology*, 1974(Dec), Vol 125(2), 265-272.—Investigated the relationship between multiplicative classification and inductive reasoning with 103 9-yr-old children. Regression analysis showed a significant association. The variance accounted for in B. Inhelder and Piaget's Standard Matrix Test by performance on the Coloured Progressive Matrices test was 34%. It was expected that the operational component of the latter test would be restricted to conceptual items. The data did not support this expectation. It is concluded that for the present sample, there was an overlap between these 2 domains of mental operations.—*Journal abstract*.

11394. Chateau, John. [The two orientations in the child's world.] (Fren) *Enfance*, 1974(Jan-Apr), No 1-2, 5-20.—Boys and girls 4-6 yrs old were shown cardboard geometric colored forms. In a previous experiment the children had learned that each colored form represented a character or scenery in the story of Little Red Riding Hood. They were asked, for each of 15 objects, "What is it?" If they said "It's a wolf," the response was recorded

as symbolic; if merely "a black circle," the response was perceptive. Results showed a duality of attitude, symbolic as opposed to perceptive. Another study showed that color is more significant than form at younger ages. Adolescents asked to place numbered counters on a triangular arrangement of square spaces showed another duality; perceptive as opposed to abstract. It is concluded that there is a split in the child psyche between the real and the imaginary. This fundamental ambiguity persists in adult thought and often manifests itself in the schizoid character.—S. S. Marzolf.

11395. Dempsey, Arthur. (East Texas State U) **Videotape: Piagetian tests of time perception.** In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.

11396. Denney, Nancy W. & Duffy, Diane M. (U Kansas) **Possible environmental causes of stages in moral reasoning.** *Journal of Genetic Psychology*, 1974(Dec), Vol 125(2), 277-283.—Conducted a study of both mothers and their children ( $n = 176$ , 17 10-, and 17 14-yr-olds) to determine whether parents imply different moral principles to children of different ages and whether there is a relationship between the type of moral reasoning that the parents imply and the level of moral reasoning used by the child. Children's responses to moral dilemmas and the mothers' responses to hypothetical situations were classified according to L. Kohlberg's (1969) 3 main categories—preconventional, conventional, and postconventional. Results indicate that as the age of the children increased, both the level of moral reasoning used by the children and the level of moral reasoning implied by the mothers' treatment of the children increased. Even with age partialled out, there was a significant positive relationship between the mothers' and children's implied levels of moral reasoning.—*Journal abstract.*

11397. Docherty, Edward M. (U Wisconsin, Madison) **Identifying concrete and formal operational children.** In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.

11398. Downing, John & Oliver, Peter. (U Victoria, British Columbia, Canada) **The child's conception of "a word."** *Reading Research Quarterly*, 1973-1974, Vol 9(4), 568-582.—Examined preschool, kindergarten, and 1st-grade children's conceptual understanding of what constitutes a spoken English word. Ss were presented with examples of 8 classes of auditory stimuli to which they responded "yes" if they thought each was a single word and "no" if they did not. Certain age trends were noted with respect to the number of correct responses to each class of stimuli and to the number of children demonstrating concept attainment within each stimulus class. All of the Ss, regardless of age, confused isolated phonemes and syllables with spoken words. All were also able to recognize that nonverbal sounds which were not identifiable were not words. Until the age of 6.5 yrs, however, Ss tended to confuse identifiable nonverbal

sounds, phrases, and sentences with words. These confusions disappeared with older children. Ss between 5.6 and 6.5 yrs old tended to exclude long words from their conception of the spoken word, but Ss younger and older than this age group did not. (French & Spanish summaries)—*Journal abstract.*

11399. Edwards, Derek. (Loughborough U, England) **Sensory-motor intelligence and semantic relations in early child grammar.** *Cognition*, 1973, Vol 2(4), 395-434.—Explores the interface between universal semantic relations and universal sensory-motor cognitions, which meet in the content and process of language acquisition at the beginning of syntax in 2-word utterances. Based on case grammar and on the findings of studies of early child language, a system of semantic clause-types is elaborated for the description of the relational meanings that are apparently expressed universally in the speech of young children. These semantic relations are compared to the concepts invoked in Piaget's descriptions of sensory-motor intelligence, in particular to the concepts of permanent objects and their spatial relations, to the dual concepts of persons as physical objects and as active beings, and to the role of persons as causers of changes in the locativity of objects. A close correspondence is found, and it is claimed that the nature of sensory-motor intelligence severely constrains the range of relational meanings expressed, including even the child's notions of possessive relations between persons and objects, of attributes of objects, and his use of apparently experiential verbs. (French summary) (35 ref)—*Journal abstract.*

11400. Fagan-Dublin, L. (California State U, Fullerton) **Lateral dominance and development of cerebral specialization.** *Cortex*, 1974(Mar), Vol 10(1), 69-74.—Administered to left-handed and right-handed 5-6 yr old children the verbal and nonverbal (Performance) subtests of the WISC, to reveal possible differences in abilities between the 2 groups. Since previous studies by others showed such differences in specific adult groups, this investigation sought to discover whether or not differences associated with handedness (a) are detectable earlier in development and (b) exist in nonspecialized individuals. Results indicate that there are no significant differences between left-handed and right-handed 5-yr-old children with respect to their verbal and performance abilities.—R. Gunter.

11401. Guerrieri, Mary A. & Frank, Harry. (U Michigan, Flint) **Height and diameter cues in conservation of volume.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1110.—Results of administering to 7-8 yr old conservers and nonconservers volume problems in which either height or volume was held constant confirm the hypothesis that failure to conserve volume is not mediated by attention to diameter cues, as has been suggested.

11402. Hathaway, Walter E. & Hathaway-Theunissen, Anneke. (Portland Public Schools, OR) **The unique contributions of Piagetian measurement to diagnosis, prognosis, and research of children's mental development.** In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern*

California. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.

11403. Hornemann, Jacqueline. [Influence of content upon the solution of logical problems.] (Fren) *Enfance*, 1974(Jan-Apr), No 1-2, 45-64.—Attempted to determine whether deficiency in verbal facility manifests itself in a variety of tasks or chiefly in those operations depending on verbal structures. 2 groups of boys and girls aged 11-16 were compared; the 449 experimental Ss were characterized by lesser verbal performance than that of the 617 control Ss. A variety of tests were given, including a Scale of Logical Development based on Piagetian concepts, and educational achievement and interest tests. Between-group and intragroup analyses and a factor analysis are reported in detail. Results support Piaget's hypothesis that all normal Ss will achieve the formal stage of intellectual development but the way in which this stage is reached will not necessarily be the same in all cases. Interests, specific aptitudes, and differences in concrete experiences will alter the process. (16 ref)—S. S. Marzolf.

11404. Kershner, John R. (Ontario Inst for Studies in Education, U Toronto, Canada) **Visual-spatial organization and reading: Support for a cognitive-developmental interpretation.** *Journal of Learning Disabilities*, 1975(Jan), Vol 8(1), 30-36.—Studied 20 7-yr-old Grade 2 children to (a) test whether the conceptual, spatial ability of 7-yr-olds is related more highly to reading than their visual, perceptual ability; and (b) determine whether concrete operational children with low visual-perceptual skills, can, nevertheless, read adequately. Results indicate that Ss' cognitive spatial ability was better than their visual-perceptual ability in differentiating good from poorer readers. The visual-perceptual skills measured by the Frostig Developmental Test of Visual Perception were insufficient for advanced reading at the Grade 2 level and an unnecessary requirement for high reading ability. Results suggest that perceptual-motor training will be most effective when used preventively rather than remedially and when the programs are implemented during the early years of development at the time the child is in Piaget's preoperational stage. The study supports an alternate theoretical framework for understanding the relationship of visual-perceptual deficits and reading. (20 ref)—*Journal abstract*.

11408. Lahey, Margaret. (Montclair State Coll) **Use of prosody and syntactic markers in children's comprehension of spoken sentences.** *Journal of Speech & Hearing Research*, 1974(Dec), Vol 17(4), 656-668.—Compared 27 4-yr-old and 27 5-yr-old nursery school children's comprehension of coordinate, center-embedded relative clause, and right-branching relative clause sentences under 4 conditions of presentation: (a) prosody (P) and syntactic markers (M) intact, (b) P intact and M eliminated, (c) M intact and P eliminated, and (d) M and P eliminated. The number of semantic-syntactic relationships in a sentence that were correctly acted out were analyzed by age, sentence type, and conditions of presentation. More relationships were acted out appropriately by 5-yr-old Ss. Differences between sentence type were significant, with coordinate sentence type the easiest and right-branching sentence type the most difficult. Conditions of presentation did not significantly affect responses, although there was a significant Condition  $\times$  Sentence Type interaction. Scores were significantly lower for center-embedded sentences when M was intact and P eliminated. It is concluded that word order was the major linguistic cue used by the Ss to process these sentences. (25 ref)—*Journal abstract*.

11410. Leroy-Boussillon, A. & Martinex, F. (Inst of Neurophysiology & General Psychophysiology, Marseille, France) **[An auditory-phonetic prerequisite for learning written language: Syllabic analysis.]** (Fren) *Enfance*, 1974(Jan-Apr), No 1-2, 111-130.—Recognizing individual letters and knowing their sounds does not ensure ability to use them in writing dictated syllables; ability in syllabic analysis may be lacking. Except for those having auditory and speech deficits, the 224 Ss were taken from schools at 4 socioeconomic levels. IQs were available for all. Beginning at age 5 a test consisting of 42 2-letter syllables (a consonant followed by a vowel) was given every 3 mo for 3 yrs. The syllables were pronounced and the children were asked to write them. For the group as a whole the means produced an S-shaped curve over time. When the Ss were divided into 8 IQ subgroups the curves were roughly parallel except for the 2 lowest levels, where the curves did not reach the 2nd inflection. Those with IQs over 130 attained perfect scores at the beginning of the 2nd yr, but most 6-yr-olds lacked maturity in this ability. (English summary) (28 ref)—S. S. Marzolf.

11412. Millar, W. Stuart. (U Strathclyde, Glasgow, Scotland) **The role of visual-holding cues and the simultanizing strategy in infant operant learning.** *British Journal of Psychology*, 1974(Nov), Vol 65(4), 505-518. —Monitored the operant acquisition of a manipulative response and concurrent visual fixation behavior in a total of 96 6- and 9-mo-old infants under conditions where a cue marked the discontiguous feedback source, and where no such cue was available. Nonavailability of the visual cue disrupted manipulative response acquisition of 6-mo-old but not 9-mo-old infants. Cue-assisted younger infants responded at a level comparable to the 9-mo-olds and at a level reliably higher than the younger no-cue group. 9 mo-old infants performed equally well under no-cue and cue-assisted conditions. This finding, which demonstrates the importance of visual-holding during the interresponse interval, is interpreted in terms of the increasing capability of infants during the 2nd half of the 1st yr to spontaneously relate centrally retrieved information to concurrent activity and to regulate behavior on the basis of this information. Noncontingent stimulation elicited greater visual fixation of the feedback source at both ages in the presence of the cue and related to the occurrence of acquisition. 9-mo-old infants revealed more coincidental visual and manipulative behavior than did younger infants, but only with the cue available. The visual data are discussed in terms of the prerequisite discrimination of contingent from noncontingent stimulation for response acquisition, and the generalized use of the simultanizing strategy.—*Journal abstract*.

11413. Nelson, Keith E. & Bonvillian, John D. (New School for Social Research, New York, NY) **Concepts and words in the 18-month-old: Acquiring concept names under controlled conditions.** *Cognition*, 1973, Vol 2(4), 435-450.—Examined, longitudinally, the use of available evidence in acquiring words by 5 male and 5 female white, middle-class 16.2-17.5 mo olds. In comparison with previous work on early word meaning, 2 essential departures in design were employed—word use by the Ss was exhaustively detailed in an experimental setting, and this setting permitted systematic control and limitation in patterns of referent object encounter and of adult naming for the objects (toys). Although relatively few examples from which to learn word and concept meanings were presented to Ss during the 6-mo study, they succeeded in learning to use many of the words appropriately. Variations in the course of learning for different Ss are discussed, with special attention to the ways in which nonverbal action or mother-child interaction could have influenced the S's progress. Ss were required to judge distance by interpreting each of the 6 common pictorial cues depicted individually in a set of pictures. Analysis of mean scores reveals a clear developmental trend in both the groups. Intelligence was significantly correlated with the scores. With intelligence controlled, significant retarding effects of deprivation on the scores at the higher age levels but none at 3-4 yrs were found. Comparison of scores on each of the 6 cues revealed the same tendency. Lack of heterogeneity and absence of stimulation in orphanages had a general retarding influence on the development of the skill for pictorial depth perception. (24 ref)—*Journal abstract.*

11425. Stewin, L. L. & Martin, Jan. (U Alberta, Edmonton, Canada) **The developmental stages of L. S. Vygotsky and J. Piaget: A comparison.** *Alberta Journal of Educational Research*, 1974(Dec), Vol 20(4), 348-362.

—Conducted a study of 104 4-16 yr olds to explore the relationship between the stages of cognitive development proposed by L. S. Vygotsky (1962) and Piaget. All Ss were in the average range of intelligence, were in the usual school grade for their age, and had no history of neurological or emotional problems. Ss were administered the Vygotsky Concept Formation Test as well as the Piagetian tasks related to the conservations of continuous and discontinuous quantity, weight, area, volume, and density. Responses were scored qualitatively in terms of the described developmental model of each theorist. Developmental levels were converted to a

numerical scale within each system and were compared through correlational analysis. Results led to the conclusion that the 2 theoretical models are closely related since both Piaget's and Vygotsky's models of cognitive development appeared to be representative of children's thought processes at all levels of sophistication. 11428. Turkewitz, Gerald & Creighton, Susan. (Albert Einstein Coll of Medicine, Yeshiva U) **Changes in lateral differentiation of head posture in the human neonate.** *Developmental Psychobiology*, 1975(Jan), Vol 8(1), 85-89.

—Examined developmental changes in the relationship between lateral differences in responsiveness and the assumption of asymmetrical head postures. The head turning of 70 infants ranging in age from 0 to 72 hrs was observed following a procedure (maintenance of the head in a midline position) known to reduce or eliminate lateral differences in the infant's response to stimulation. Even following this procedure Ss older than 12 hrs made significantly more right than left head turns, whereas younger Ss exhibited no such difference. When lateral differences in sensitivity were not interfered with in 0-12 hr old infants ( $n = 20$ ) they, like the older infants, made significantly more right than left turns. Results are discussed in terms of possible developmental consequences of a reciprocity between asymmetric head position and lateral differences in sensitivity.—*Journal abstract.*

**geometric figures.]** (Fren) *Enfance*, 1974(Jan-Apr), No 1-2, 81-92.—Forms to be reproduced may differ in the ease with which they may be broken down into parts. 2 drawings capable of being so broken down, at 2 levels of difficulty, were copied and then reproduced from memory by 103 Ss in age groups 4, 4-6, and 5 yrs. Failure and 3 levels of success were defined. The order of progression by age from lower to higher levels of performance was the same for copying as for drawing from memory, but in each age group levels of success were higher for drawings copied than for drawings from memory. Whether similar results would be obtained with drawings which could not be readily broken down into parts needs investigation, since the results would bear upon the development of the child's conception of space.—S. S. Marzolf.

11431. Vezin, Jean-Francois. (U René Descartes, Lab de Psychologie Génétique, Paris, France) **[Comparative study of more and less concrete diagrams and verbal statements: Their correlation and role in learning as a function of age.]** (Fren) *Enfance*, 1974(Jan-Apr), No 1-2, 21-44.—Materials for programed instruction, consisting of verbal texts with and without examples, and diagrams (concrete, abstract, and in perspective) were presented to 18 treatment groups, each consisting of 10 boys and 10 girls aged 8-14 distributed in 3 school grades, to determine the degree to which the diagrams could be related to the texts. Success was related to the concreteness of the verbal material and of the diagrams. Differences in the efficacy of the different kinds of diagrams were most notable where Ss were called upon to produce a hierarchy of important words in the text. In this case the concrete diagrams were best. Examples were effective in relating statements to drawings but impeded production of resumes. As age increased, verbal and graphic symbolism were used more effectively. (15 ref)—S. S. Marzolf.

11432. Wallon, Henri. **The origins of thought in the child.** *International Journal of Mental Health*, 1972-1973(Win), Vol 1(4), 53-66.—Contrasts the intellectual inertia of the child and his susceptibility to external and internal distractions with the configuration-forming capacity of adult thought. The aspects of intellectual development considered include the elementary structure of the child's thought; the contradictory sources of information derived from his direct personal experience and from social experience (through language and tradition); the significance of gestures; imitation; intellectual and verbal techniques as the origins of mental representation; the progressive differentiation and identification process as a function of the acquisition of the concept of the "same" and its diverse meanings; and finally, the problem of the child's inability to dissociate subjective from objective reality.—A. H. Alawi.

11433. Windmiller, Myra. (U California, Berkeley) **The relationship between a child's conception of space and his comprehension and production of spatial locatives.** In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions*: February 15, 1974: University of Southern

11434. Zelazo, Philip R.; Hopkins, J. Roy; Jacobson, Sandra & Kagan, Jerome. (Harvard U) **Psychological reactivity to discrepant events: Support for the curvilinear hypothesis.** *Cognition*, 1973, Vol 2(4), 385-393.—Observed 80 male and 60 female 7½-mo-old infants under 5 a priori judged levels of discrepancy to assess whether sustained attention was linearly or curvilinearly related to degree of discrepancy from an experimental standard. Following habituation, Ss were exposed to either the repetition of the standard, a minimal, 1st- or 2nd-level moderate discrepancy, or a novel stimulus having no relation to the standard. The related stimuli, varying in elongation, were sphere, pear, club, and cylinder-shaped objects; the novel stimulus was a different colored, toothlike object. 80 Ss observed the sphere as the standard and the cylinder as the 2nd-level moderate discrepancy; 60 Ss were exposed to the reverse order with the cylinder as the standard. Habituation and recovery of responding were observed in an operant paradigm. Leverpressing, fixation, and vocalization increased most to the 2nd-level moderate stimuli and decreased most to the familiar and novel objects; fretting was highest to the redundant stimuli and lowest to the moderate objects. There were no stimulus main effects or interactions. Results support the hypothesis of a curvilinear relation between stimulus discrepancy and sustained attention, excitement, and preference. (French summary) (21 ref)—*Journal abstract*.

#### Emotional & Personality Development

11435. Boddez, Martha. **An analysis of the self-concept and the impact of success and failure upon the perception of performance and upon the self-concept of junior high school students: I.** *St Louis University Research Journal*, 1973(Sep), Vol 4(3), 367-413.—Analyzes various theories of the development of the self in order to determine a common factor at the basis of self-concept formation. Special attention is given to the importance of self-knowledge in education and the influence of the family, the peer group, and society in general for self-concept development. 97 male and 99 female 15-16 yr old high school students performed tests in area estimation of geometric figures. Half of each group performed in a "success" mode in which 3 sample guesses of figure area are declared correct by the E, or incorrect for the "failure" group; S then judged 20 figures. To study the impact of previous failure or success on subsequent perception of performance, a Pearson product-moment correlation was performed between self-concept and academic rating. Results are to be presented in a subsequent paper. (97 ref)—J. Carlson.

11442. Mischel, Walter & Baker, Nancy. (Stanford U) **Cognitive appraisals and transformations in delay behavior.** *Journal of Personality & Social Psychology*, 1975(Feb), Vol 31(2), 254-261.—Investigated the effects of different cognitive representations of the rewards (outcomes) in a delay of gratification paradigm on children's ability to wait for these rewards. Ss were 60 3-5 yr olds in nursery school. It was found that consummatory (arousing) ideation directed at the relevant (contingent) rewards hindered effective delay. In contrast, cognitive transformations of the rewards which focused on their nonconsummatory qualities and associations significantly facilitated delay behavior more than did comparable ideation about similar rewards irrelevant to the delay contingency. Consummatory ideation focused on rewards irrelevant to the contingency also greatly helped to maintain delay. Theoretical implications for the role of fantasy and cognitive appraisal in self-control are examined.—*Journal abstract.*

11443. Money, John. (Johns Hopkins U, Medical School) **Prenatal hormones and postnatal socialization in gender identity differentiation.** *Nebraska Symposium on Motivation*, 1973, Vol 21, 221-295.—Rejects the concepts of sex drive, instinct, need, and motivation on the grounds that they cannot be handled empirically or operationally (any more than phlogiston or possession by demons could be) and substitutes threshold for the release or inhibition of behavior. Chromosomes, fetal gonads and hormones, neural pathways, and genital

appearance are listed as cumulative components of adult gender. Photographs of varying genital differentiation in genetic vs gonadal males and females at different ages are presented. Results of corrective therapy and/or surgery are shown. Transvestite dissexual identity, transsexual reassignment, and transpositions of gender identity and role are compared.—*J. M. Roberts.*

11444. Rosenberg, Benjamin G. & Sutton-Smith, Brian. (Bowling Green State U) **Family structure and sex-role variations.** *Nebraska Symposium on Motivation*, 1973, Vol 21, 195-220.—Contends that men and women are more alike than they are different. Sibling position in relation to California Q-sort responses, number of offspring in the family, and their parents' sibling positions are compared. Family structure affects sex-role stereotypes, family relations, and within-family rivalries to produce different results. Family size is studied in relation to eventual choice of spouse and number of children. The effects of family structure on sex-role development are powerful, numerous, and diverse. (23 ref)—*J. M. Roberts.*

11445. Rudhe, L. & Ekecrantz, L. (U Stockholm, Psychological Lab, Sweden) **Transitional phenomena: The typical phenomenon and its development.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(4), 381-400.—Investigated the basic characteristics of "transitional phenomena," the emotional dependency on special objects displayed by children, especially at bedtime and during times of anxiety. Attention was given to the possibility of transitional phenomena being a defense mechanism against separation anxiety. 77 mothers of 6-yr-old children were interviewed about their children's behaviors. Most typically, the children used sounds, movements, and pieces of cloth, beginning during the 1st yr of life and continuing for several years. Strong emotional dependency was apparent in the fact that the transitional phenomena became more important than the mother, especially at bedtime. Great possibilities for close physical contact with the mother promoted the development of transitional phenomena, precluding the applicability of a simple model of substitution. (28 ref)—*Journal abstract.*

11446. Stetic, Edward C. & Lorr, Maurice. (Catholic U of America) **Age and sex differences in personality during adolescence.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1123-1126.—Attempted to determine what changes occur in adolescent personality in the age period between 12 and 19 yrs. Efforts were made to identify the personality dimensions that distinguish males from females at various age periods and any age trends in personality change. The Interpersonal Style Inventory was administered to 331 males and 358 females from high schools. Males and females were significantly differentiated on this inventory at each of 4 age levels (12-14, 15, 16, and 17-19 yrs) through use of discriminant function analyses. Females scored more Sociable, Nurturant, Conscientious, Help-seeking, and Anxious at all age levels. The males scored more Detached, Withholding, Self-sufficient, and Stable. Results are in close agreement with those reported by A. Sealy and R. Cattell (1966), J. Garai (1970), and G. Gurin et al (1960).—*Journal abstract.*

11447. Wallon, Henri. **The emotions.** *International Journal of Mental Health*, 1972-1973(Win), Vol 1(4), 40-52.—Discusses the disruptive and adaptive function of emotions with special reference to J. R. Kantor's views. The primitive and automatic nature of emotions is in contrast to the conscious control of perceptual responses. The psychobiological development of emotions, arising from the interplay of environmental and maturational functions, is described. The emotions are regarded as the origin of consciousness, and they bring about a fusion of feeling between the individual and the group. Through the group the child acquires the differentiated action sequences and intellectual tools which he must have to operate with the distinctions and classifications necessary for knowledge of things and of himself.—A. H. Alawi.

### Social Behavior & Family Relations

11448. Adamski, Wladyslaw. (Polska Akademia Nauk, Poland) **[Socio-occupational attitudes of working youth.]** (Polh) *Studia Socjologiczne*, 1974, No 2(53), 139-154.—Reports on the relationship between economic and political attitudes at different age levels. The cross-sectional sample was made up of 2,059 Ss 15-30 yrs old and 1,097 Ss 30-65 yrs old. In general, the under-30 group was more materialistic, self-centered, and better educated than the over-30 group. Political interest decreased as age level increased.—H. Kaczowski.

11449. Dembrowski, Theodore M. & Pennebaker, James W. (Eckerd Coll) **Reactions to severity and nature of threat among children of dissimilar socioeconomic levels.** *Journal of Personality & Social Psychology*, 1975(Feb), Vol 31(2), 338-342.—Explored the conditions under which lower- and middle-class preschool children react differently in the "forbidden toy" paradigm. In a  $2 \times 2 \times 2$  design, 40 middle- and 43 lower-class children (mean age = 58 mo) were threatened with loss of a gift of money (mild or severe) or loss of approval (mild or severe) if they played with an attractive toy. Rankings of the forbidden toy before and after a 5-min temptation period indicate opposite reactions in middle- and lower-class Ss. For middle-class Ss, threatening loss of approval produced an effect consistent with a prediction derived from dissonance theory (i.e., devaluation of the toy under mild rather than severe threat). Threatening loss of small or large quantities of money generated intermediate and similar amounts of derogation. For lower-class Ss, threatening mild or severe loss of approval produced moderate and similar amounts of devaluation. However, threatening loss of money produced an effect opposite to that predicted by dissonance theory (i.e., more devaluation under threat of large than small money loss). This reversal resists both dissonance and reinforcement-familiarity interpretations. (17 ref)—*Journal abstract.*

11450. Furukawa, Ayako. (Osaka U, Japan) **[Developmental psychological study about parental leadership for their child.]** (Japn) *Japanese Journal of Educational Psychology*, 1974(Jun), Vol 22(2), 69-79.—379 children from kindergarten through high school and 26 mothers responded to a questionnaire to indicate their perceptions of 2 functions of parental leadership as the source of affection and of discipline in 2 dimensions: as an ideal

and as the practical rule of life. Developmental changes in perception of parental leadership were significant ( $p < .01$ ). Curvilinear relationships were found between developmental stages and perception of parental leadership as the practical rule of life, but not as an ideal. Results indicate that the Ss as they approached adolescence tended to be independent of parental control while the need for the parent as the source of affection continued to be strong throughout the developmental stages. (English summary) (22 ref)—S. Choe.

11451. Gabel, Harris. (George Peabody Coll) **Effects of parent group discussion on adolescents' perceptions of maternal behavior.** *Journal of Community Psychology*, 1975(Jan), Vol 3(1), 32-35.—Presents an evaluation of a parent group discussion program led by trained paraprofessional leaders and focusing on maternal behavior as perceived and described by the adolescent children of the participants. Both before the start of this group and after 5 weekly meetings, these children completed the 108-item Child Report of Parental Behavior Inventory. Results show that following the program, the 6 participating mothers were described by their children as allowing greater autonomy and showing more positive involvement with their children than control mothers. This is interpreted as support for the view that maternal participation in group discussion programs leads to changes in adolescents' perceptions of aspects of their mothers' behavior.—R. S. Albin.

11452. Gelso, Charles J. (U Maryland) **The transmission of attitudes toward child rearing: An exploratory study.** *Journal of Genetic Psychology*, 1974(Dec), Vol 125(2), 285-293.—Conducted a study of 63 female and 30 male students (28 were parents and 65 were not) to investigate the relationship between Ss' attitudes toward childrearing and Ss' perceptions of the manner in which their parents treated them during their childhood. These attitudes were assessed using 3 dimensions suggested by A. Roe—acceptance, concentration, and avoidance (1957). Results indicate that (a) for males, the relationship with the mother was influential in developing child rearing attitudes while the relationship with the father was of negligible importance; (b) for females, mothers' and fathers' additively combined attitudes appeared to be more influential than either taken separately; and (c) for nonparents, avoidance by their parents was positively related to Ss' possession of rejecting childrearing attitudes. Implications of these differences are discussed.—M. E. Pounsel.

11453. Gunsberg, Linda. (Montefiore Hosp & Medical Ctr, New York, NY) **Conflict training and the development of moral judgment in children.** In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.

11454. Lieberman, Florence. (Hunter Coll, School of Social Work, City U New York) **Sex and the adolescent girl: Liberation or exploitation?** *Clinical Social Work Journal*, 1973, Vol 1(Special Issue), 224-243 Issue.—Illustrates the complex world of the adolescent girl through case examples. Many factors in her environment which influence her sexual development and behavior

are discussed. The richness of the clinical material provides an understanding of the difficulties many young women encounter in adolescence. Treatment suggestions are offered throughout.—S. R. Stein.

11455. Marsella, Anthony J.; Dubanoski, Richard A. & Mohs, Karen. (U Hawaii) **The effects of father presence and absence upon maternal attitudes.** *Journal of Genetic Psychology*, 1974(Dec), Vol 125(2), 257-263.—Administered the Parental Attitude Research Instrument to 34 wives of nuclear submarine personnel under counterbalanced conditions of father presence and absence. Results show that significant differences were found on 7 subscales as a function of the father's status. 4 of the subscales reflected themes of maternal domination, and the remaining 3 reflected themes of marital dissatisfaction and discord. In all of the 7 instances, scores were higher under conditions of father presence. It is suggested that father presence and absence effects may be mediated by the alterations which occur in maternal attitudes under these conditions. (21 ref)—*Journal abstract*.

11456. Martin, William C.; Bengston, Vern L. & Acock, Alan C. (California State U, Chico) **Alienation and age: A context-specific approach.** *Social Forces*, 1974(Dec), Vol 53(2), 266-274.—Used a context-specific conceptualization of alienation to describe age-group differences. Traditionally, alienation has been treated in terms of specific modes (e.g., powerlessness, meaninglessness, normlessness, social isolation, and self-estrangement). This research adds to each of these modes social structural contexts (e.g., polity, economy, education, religion, and family) to produce a matrix of context-specific alienation. Age-group differentials on specific components of alienation were then examined in a 3-generation sample of 182 males. The postulate that alienation is related to position in the social structure leads to the hypothesis that there is a curvilinear relation between alienation and age, the youth most alienated, the middle-aged least, and the elderly in between. The hypothesis was generally supported. (30 ref)—*Journal abstract*.

11457. Moss, Howard A. (NIMH, Child Research Branch, Bethesda, MD) **Early sex differences and mother-infant interaction.** In R. C. Friedman, R. M. Richart, R. L. Vande Wiele & L. O. Stern (Eds), *Sex differences in behavior*. New York, NY: John Wiley & Sons, 1974. xvi, 495 p.

11458. Nel, B. F. (U Pretoria, South Africa) **The role of sensitivity in pedagogical observation and discourse (dialogue, Gespräch).** *Interpersonal Development*, 1973-1974, Vol 4(3), 190-196.—Considers, first, that every person is ontologically endowed with sensitivity. It is proposed that discourse and observation play an important part in the development of a child. The adult-child relation is a subject-subject relation, not a traditionally scientific subject-object relation. The pedagogical teacher has the task of becoming involved in the child's world relations. By mutual sensitivity, communication and encounter are established, and discourse proceeds, encompassing togetherness, a further precondition for actualization of the child's potentialities.—*Journal abstract*.

11459. Royak, A. A. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of Preschool Education, Moscow) **[Psychological aspects of peer conflict situations among preschool children.]** (Russ) *Voprosy Psikhologii*, 1974(Jul-Aug), No 4, 71-83.—Conducted a 3-yr longitudinal study of conflicts in play situations among children in 2 kindergartens. Situational sampling, sociometry, individual assessment, questionnaires, and interviews with children and their parents were the techniques employed. 2 factors in conflict situations were identified: those arising from the child's inability to perform the acts necessary for successful play ("operational" factors), and those due to the child's insufficient motivation to participate in play as compared with the motivation of the group as a whole. The characteristics of these 2 conflict situation types are discussed. (English summary)—L. Zusne.

11460. Sharabany, Ruth. (Educational Testing Service, Psychological Studies, Princeton, NJ) **Socialization in the Israeli kibbutz: Bibliography.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 185.

11461. Smith, Nancy F. & Grenier, Mary K. (McGill U, Montreal, Quebec, Canada) **English- and French-Canadian children's views of parents.** *Canadian Journal of Behavioural Science*, 1975(Jan), Vol 7(1), 40-53.—A total of 160 lower- and middle-class, English- and French-Canadian children from 1st and 3rd grades in the Montreal area were interviewed about their perceptions of parental roles. When parental differences in nurturance, power, and discipline were compared, lower-class Ss perceived a greater division of parental roles than middle-class Ss. When 2 subtypes of nurturance (supportive and companionship) were contrasted, and 3 subtypes of discipline (physical, affective, and deprivational) were examined, it was found that there were important differences related to the children's ethnicity and sex, as well as social class. The importance of further exploration of subdivided discipline and nurturance scales is emphasized. (French summary) (20 ref)—*Journal abstract*.

11462. Steinfeld, George J. (Federal Correctional Inst, Narcotic Unit, Danbury, CN) **Piaget's concept of decentering in relation to family process and therapy.** In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.

11463. Stern, Daniel N. & Bender, Estelle P. (New York State Psychiatric Inst, Dept of Developmental Processes, New York) **An ethological study of children approaching a strange adult: Sex differences.** In R. C. Friedman, R. M. Richart, R. L. Vande Wiele & L. O. Stern (Eds), *Sex differences in behavior*. New York, NY: John Wiley & Sons, 1974. xvi, 495 p.

11464. Tait, Perla. (Temple U) **Method for quantitative analysis of dramatic play.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 1012-1014.—Describes a method for the quantitative analysis of dramatic play based on narrative case records in which the following items are isolated: dramatic units, involvement of O requested by S, and the longest dramatic unit. The longest dramatic

units are further analyzed for amount of time, subunits introduced, intensity, and themes expressed.

11465. **Thoman, Evelyn B.** (U Connecticut) **Some consequences of early infant-mother-infant interaction.** *Early Child Development & Care*, 1974, Vol 3(3), 249-261.—Summarizes human and animal studies of the feedback system of infant-mother-infant interactions. Not only does the mother provide the infant's environment, but the infant also exerts an influence on the mother, thereby creating a system of continuous feedback in terms of behavior. Evidence for failure of feedback within the system was found in studies of infants who cry excessively despite much stimulation by their mothers, and of infants who fail to thrive although they have no apparent physiological deficits.—*W. V. Adams.*

11466. **Tzeng, Oliver C. & Dimit, Mary G.** (U Illinois) **Attitudinal differences of college students and their parents.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1247-1249.—25 male and 22 female college students living in 5 different housing units listed areas of perceived attitudinal differences with their parents on an open-ended questionnaire. 89 items were elicited, ranging in number for each individual response from 0 to 31. Eleven categories were organized to cover these items. Differences in characteristics of responses for males and females were observed.—*Journal abstract.*

11467. **Willemssen, Eleanor; Flaherty, Denise; Heaton, Christine & Ritchey, Gary.** (Santa Clara U) **Attachment behavior of one-year-olds as a function of mother vs father, sex of child, session, and toys.** *Genetic Psychology Monographs*, 1974(Nov), Vol 90(2), 305-324.—12 male and 12 female 1 yr olds were observed separately with their mothers and with their fathers in 2 structured play situations developed by M. Ainsworth and S. Bell (see PA, Vol 44:8130). Results indicate (a) an absence of sex differences or of differential reaction to the presence of mother or father, (b) an increase in attachment after separation, (c) reduced visual exploration in the presence of the stranger, and (d) a pattern of correlation suggesting that a common basis exists for attachment but not for exploratory behaviors. Findings seem inconsistent with the ethological theory of attachment of M. Ainsworth and J. Bowlby (1969).—*Journal abstract.*

### Adult Development & Aging

11468. **Botwinick, Jack & Storandt, Martha.** (Washington U) **Vocabulary ability in later life.** *Journal of Genetic Psychology*, 1974(Dec), Vol 125(2), 303-308.—Compared a group of young adults (17-20 yrs) to a group of older adults (62-83 yrs) to examine the relationships between qualitative and quantitative vocabulary test scores as they involve the age of S. Results of the study cast doubt as to the validity of the generalization that vocabulary function is maintained throughout adult life. The best possible response (i.e., superior synonym) declined with age. This decline was compensated for by very satisfactory, although less good, performance. This made the overall level of correct response appear similar for the 2 age groups, which may account for the usual report of stability of function in the course of adult aging. The compensation also accounted

for very high correlations between qualitative and quantitative scores.—*Journal abstract.*

11469. **Salvendy, Gavriel.** (Purdue U, School of Industrial Engineering) **Discrimination in performance assessments against the aged.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1087-1099.—Conducted 5 experiments with a total of 399 7-93 yr old Ss performing 6 diversified tasks to study the phenomena of increase and decrease in performance and physiological and behavioral changes with aging. Results with the greatest impact on occupational productivity are (a) Human body's physiological efficiency was the highest at a freely chosen pace for the age bracket 20-45 yrs, while paced performance yielded the highest physiological efficiency for the age bracket 45-65 yrs. (b) Different predictive validity models exist for different age categories, as the younger industrial operators (15-35 yrs) had higher test scores than the older age group (36-58 yrs) for an equivalent level of production performance. It is concluded that both manipulative skills and personality attributes are affected by aging. (25 ref)—*Journal abstract.*

11470. **Strnad, M.** (Oddělení metodiky Správy sociálních služeb NVP, Prague, Czechoslovakia) **[Differentiated approaches to new arrivals at homes for the elderly.]** (Czec) *Československá Psychiatrie*, 1973(Jun), Vol 69(3), 195-198.—Discusses 5 kinds of adjustment problems encountered by newcomers to homes for retired elderly people. The problems concern (a) lowering of living standard, (b) loss of own household and the related independence and freedom of action, (c) loss of mobility due to somatic illness, (d) recent loss of wife or husband, and (e) feelings of being deserted by their families. Better utilization of social workers for support and therapy, and extramural activities for the elderly people are recommended. (Russian & English summaries)—*V. Fischmann.*

11471. **Taub, Harvey A.** (VA Hosp, Syracuse, NY) **Coding for short-term memory as a function of age.** *Journal of Genetic Psychology*, 1974(Dec), Vol 125(2), 309-314.—21 young (mean age = 23.1 yrs), 21 middle-aged (mean age = 51.4 yrs), and 21 old (mean age = 69.7 yrs) female Ss viewed letter sequences of 12 letters each and were required to recall the letters in exactly the same order as they saw them. In half of the sequences the letters could not be coded into meaningful units, while in the other half the letters could be chunked into 3 complete 4-letter words. Findings indicate that the age groups did not differ from each other in the low-code condition, but that with the high-code sequences the old Ss performed significantly more poorly than either the young or middle-aged Ss. These findings suggest an age-related deficit in the coding of sequentially ordered material.—*Journal abstract.*

11472. **Tramer, Richard R. & Schludermann, Eduard H.** (U Manitoba, Deer Lodge Hosp, Winnipeg, Canada) **Cognitive differentiation in a geriatric population.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1071-1075.—Tested the differentiation hypothesis in 94 52-88 yr old male inpatients who were administered the Colored Progressive Matrices (a test of intellectual ability), the Children's Embedded Figures Test, and a socializing scale. A correlation of .58 ( $p < .01$ ) between field dependence and intellectual ability was similar to

that previously obtained with younger age groups. A positive correlation of .22 ( $p < .05$ ) between field dependence and socializing was contrary to theoretical expectation. (15 ref)—*Journal abstract*.

## CULTURAL INFLUENCES AND SOCIAL ISSUES

11473. Billings, Dwight. (U North Carolina, Chapel Hill) **Culture and poverty in Appalachia: A theoretical discussion and empirical analysis.** *Social Forces*, 1974(Dec), Vol 53(2), 315-323.—Questioned the cultural explanation for the persistence of poverty in Appalachia (i.e., that the region's traditional culture ill equips it for participation in the modern world). Data from a "middle-class orientation" scale administered to several thousand respondents in North Carolina (age was controlled in the analysis) suggest that attitudinal factors cannot be used to account for economic development as it occurred in the Appalachian region. (41 ref)

### Culture & Ethnology & Race Relations & Religion

11474. Berry, John W. & Annis, Robert C. (Queen's U, Kingston, Ontario, Canada) **Acculturative stress: The role of ecology, culture and differentiation.** *Journal of Cross-Cultural Psychology*, 1974(Dec), Vol 5(4), 382-406.—Conducted a study of 3 Amerindian peoples (Cree, Tsimshian, and Carrier) to examine the hypothesis that the psychological response to social change would vary as a function of both the acculturative pressures brought to bear on a community, and the traditional cultural and behavioral features that characterize the community. Results of interviews and tests with 405 Ss indicate that the greater the cultural discontinuities across cultures, then the greater the acculturative stress; within Amerindian communities, levels of psychological differentiation were negatively related to acculturative stress. It is concluded that specific cultural and individual differences must be taken into account when attempting to understand relationships between culture contact and acculturative stress; its course is not universal. (31 ref)—*Journal abstract*.

11475. Chun, Ki-Taek; Campbell, John B. & Yoo, Jong Hae. (U Michigan, Inst for Social Research) **Extreme response style in cross-cultural research: A reminder.** *Journal of Cross-Cultural Psychology*, 1974(Dec), Vol 5(4), 465-480.—Documents the neglect of the consequences of the extreme response style (ERS) phenomenon in cross-cultural research through a selective literature review. Consideration of ERS differences permitted derivation of 3 logical consequences that pertain to (a) differences in group means, (b) the internal consistency of measures and the correlation among measures, and (c) results of dimensional analyses. Comparison of 187 US and 204 Korean college student samples on a 130-item questionnaire reveals stronger ERS in US Ss. Furthermore, the predictions derived from ERS differences were confirmed, thus demonstrating the credibility of the ERS argument. General implications of ERS for cross-cultural research are discussed. (17 ref)—*Journal abstract*.

11476. Dourley, John P. (Carleton U, St Patrick's Coll, Ottawa, Ontario, Canada) **Trinitarian models and human integration: Jung and Tillich compared.** *Journal of Analytical Psychology*, 1974(Jul), Vol 19(2), 131-150.—Jung and P. Tillich share the conviction that trinitarian symbolism is natural to human consciousness and points toward growth and integration. For Tillich, man's life and religious development are triadic, though disrupted, and participate in the undisrupted triadic life of God. For Jung, the archetypal grounding in the psyche of trinitarian symbolism is closely related to the individuation process and the development of the self. Christ is related to the self as an integrate of conscious life. This can be compared with Tillich's view that man's estrangement from God is conquered in Christ. Tillich holds that evil is a privation of the good and results from man's estrangement, while Jung adheres to the view that the shadow is real, not as a privation, but as an essential part of the whole.—*Journal summary*.

11477. Gallimore, Ronald. (U California, Los Angeles) **Affiliation motivation and Hawaiian-American achievement.** *Journal of Cross-Cultural Psychology*, 1974(Dec), Vol 5(4), 481-491.—Reviewed research which suggests that Hawaiian-American achievement is related to affiliation motivation. Fantasy need affiliation (nAff) was correlated with Scholastic Test of Educational Progress Reading achievement test scores, but not Math achievement scores, for 67 males and females in Grades 9-12. There was no relationship between need for achievement and achievement test scores. The process linking nAff and Hawaiian-American achievement is suggested to involve differential responsiveness to teacher social influence. Results support the view that there are cultural variations in the motivational antecedents of achievement. (17 ref)—*Journal abstract*.

11478. Garrity, Thomas F. (U Kentucky, Medical Coll) **Psychic death: Behavioral types and physiological parallels.** *Omega: Journal of Death & Dying*, 1974(Fal), Vol 5(3), 207-215.—Reports of the psychic death phenomenon are reviewed and grouped into 3 distinct categories on the basis of the quality of behavior antecedent to the death. Deaths following markedly excited behavior, such as fear, grief, and exultation, were placed in the 1st category. Apathetic, withdrawn, and depressed behavior were the death-precursors included in the 2nd category. The 3rd category was characterized by calm acceptance behavior prior to the death. In addition to the presentation of a behavioral typology, parallels between the latter and several hypothesized physiological explanations of psychic death are presented. (60 ref)—*Journal abstract*.

11479. Irwin, Marc H.; Schafer, Gary N. & Feiden, Cynthia P. (U New Mexico) **Emic and unfamiliar category sorting of Mano farmers and U.S. undergraduates.** *Journal of Cross-Cultural Psychology*, 1974(Dec), Vol 5(4), 407-423.—80 nonliterate Mano farmers of Liberia, West Africa, and 100 US undergraduate men were tested on a rice-sorting task appropriate to the Mano cultural setting and an analogous card-sorting task appropriate to the US cultural setting. US Ss performed more card sorts than Mano Ss, while Mano Ss performed more rice sorts than US Ss. A larger drop in performance level was associated with the use of an unfamiliar, as

units are further analyzed for amount of time, subunits introduced, intensity, and themes expressed.

11465. **Thoman, Evelyn B.** (U Connecticut) **Some consequences of early infant-mother-infant interaction.** *Early Child Development & Care*, 1974, Vol 3(3), 249-261.—Summarizes human and animal studies of the feedback system of infant-mother-infant interactions. Not only does the mother provide the infant's environment, but the infant also exerts an influence on the mother, thereby creating a system of continuous feedback in terms of behavior. Evidence for failure of feedback within the system was found in studies of infants who cry excessively despite much stimulation by their mothers, and of infants who fail to thrive although they have no apparent physiological deficits.—*W. V. Adams.*

11466. **Tzeng, Oliver C. & Dimit, Mary G.** (U Illinois) **Attitudinal differences of college students and their parents.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1247-1249.—25 male and 22 female college students living in 5 different housing units listed areas of perceived attitudinal differences with their parents on an open-ended questionnaire. 89 items were elicited, ranging in number for each individual response from 0 to 31. Eleven categories were organized to cover these items. Differences in characteristics of responses for males and females were observed.—*Journal abstract.*

11467. **Willemssen, Eleanor; Flaherty, Denise; Heaton, Christine & Ritchey, Gary.** (Santa Clara U) **Attachment behavior of one-year-olds as a function of mother vs father, sex of child, session, and toys.** *Genetic Psychology Monographs*, 1974(Nov), Vol 90(2), 305-324.—12 male and 12 female 1 yr olds were observed separately with their mothers and with their fathers in 2 structured play situations developed by M. Ainsworth and S. Bell (see PA, Vol 44:8130). Results indicate (a) an absence of sex differences of or differential reaction to the presence of mother or father, (b) an increase in attachment after separation, (c) reduced visual exploration in the presence of the stranger, and (d) a pattern of correlation suggesting that a common basis exists for attachment but not for exploratory behaviors. Findings seem inconsistent with the ethological theory of attachment of M. Ainsworth and J. Bowlby (1969).—*Journal abstract.*

### Adult Development & Aging

11468. **Botwinick, Jack & Storandt, Martha.** (Washington U) **Vocabulary ability in later life.** *Journal of Genetic Psychology*, 1974(Dec), Vol 125(2), 303-308.—Compared a group of young adults (17-20 yrs) to a group of older adults (62-83 yrs) to examine the relationships between qualitative and quantitative vocabulary test scores as they involve the age of S. Results of the study cast doubt as to the validity of the generalization that vocabulary function is maintained throughout adult life. The best possible response (i.e., superior synonym) declined with age. This decline was compensated for by very satisfactory, although less good, performance. This made the overall level of correct response appear similar for the 2 age groups, which may account for the usual report of stability of function in the course of adult aging. The compensation also accounted

for very high correlations between qualitative and quantitative scores.—*Journal abstract.*

11469. **Salvendy, Gavriel.** (Purdue U, School of Industrial Engineering) **Discrimination in performance assessments against the aged.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1087-1099.—Conducted 5 experiments with a total of 399 7-93 yr old Ss performing 6 diversified tasks to study the phenomena of increase and decrease in performance and physiological and behavioral changes with aging. Results with the greatest impact on occupational productivity are (a) Human body's physiological efficiency was the highest at a freely chosen pace for the age bracket 20-45 yrs, while paced performance yielded the highest physiological efficiency for the age bracket 45-65 yrs. (b) Different predictive validity models exist for different age categories, as the younger industrial operators (15-35 yrs) had higher test scores than the older age group (36-58 yrs) for an equivalent level of production performance. It is concluded that both manipulative skills and personality attributes are affected by aging. (25 ref)—*Journal abstract.*

11470. **Strnad, M.** (Oddělení metodiky Správy sociálních služeb NVP, Prague, Czechoslovakia) **[Differentiated approaches to new arrivals at homes for the elderly.]** (Czec) *Československá Psychiatrie*, 1973(Jun), Vol 69(3), 195-198.—Discusses 5 kinds of adjustment problems encountered by newcomers to homes for retired elderly people. The problems concern (a) lowering of living standard, (b) loss of own household and the related independence and freedom of action, (c) loss of mobility due to somatic illness, (d) recent loss of wife or husband, and (e) feelings of being deserted by their families. Better utilization of social workers for support and therapy, and extramural activities for the elderly people are recommended. (Russian & English summaries)—*V. Fischmann.*

11471. **Taub, Harvey A.** (VA Hosp, Syracuse, NY) **Coding for short-term memory as a function of age.** *Journal of Genetic Psychology*, 1974(Dec), Vol 125(2), 309-314.—21 young (mean age = 23.1 yrs), 21 middle-aged (mean age = 51.4 yrs), and 21 old (mean age = 69.7 yrs) female Ss viewed letter sequences of 12 letters each and were required to recall the letters in exactly the same order as they saw them. In half of the sequences the letters could not be coded into meaningful units, while in the other half the letters could be chunked into 3 complete 4-letter words. Findings indicate that the age groups did not differ from each other in the low-code condition, but that with the high-code sequences the old Ss performed significantly more poorly than either the young or middle-aged Ss. These findings suggest an age-related deficit in the coding of sequentially ordered material.—*Journal abstract.*

A correlation of .58 ( $p < .01$ ) between field dependence and intellectual ability was similar to

that previously obtained with younger age groups. A positive correlation of .22 ( $p < .05$ ) between field dependence and socializing was contrary to theoretical expectation. (15 ref)—*Journal abstract*.

## CULTURAL INFLUENCES AND SOCIAL ISSUES

11473. Billings, Dwight. (U North Carolina, Chapel Hill) **Culture and poverty in Appalachia: A theoretical discussion and empirical analysis.** *Social Forces*, 1974(Dec), Vol 53(2), 315-323.—Questioned the cultural explanation for the persistence of poverty in Appalachia (i.e., that the region's traditional culture ill equips it for participation in the modern world). Data from a "middle-class orientation" scale administered to several thousand respondents in North Carolina (age was controlled in the analysis) suggest that attitudinal factors cannot be used to account for economic development as it occurred in the Appalachian region. (41 ref)

### Culture & Ethnology & Race Relations & Religion

11474. Berry, John W. & Annis, Robert C. (Queen's U, Kingston, Ontario, Canada) **Acculturative stress: The role of ecology, culture and differentiation.** *Journal of Cross-Cultural Psychology*, 1974(Dec), Vol 5(4), 382-406.—Conducted a study of 3 Amerindian peoples (Cree, Tsimshian, and Carrier) to examine the hypothesis that the psychological response to social change would vary as a function of both the acculturative pressures brought to bear on a community, and the traditional cultural and behavioral features that characterize the community. Results of interviews and tests with 405 Ss indicate that the greater the cultural discontinuities across cultures, then the greater the acculturative stress; within Amerindian communities, levels of psychological differentiation were negatively related to acculturative stress. It is concluded that specific cultural and individual differences must be taken into account when attempting to understand relationships between culture contact and acculturative stress; its course is not universal. (31 ref)—*Journal abstract*.

11475. Chun, Ki-Taek; Campbell, John B. & Yoo, Jong Hae. (U Michigan, Inst for Social Research) **Extreme response style in cross-cultural research: A reminder.** *Journal of Cross-Cultural Psychology*, 1974(Dec), Vol 5(4), 465-480.—Documents the neglect of the consequences of the extreme response style (ERS) phenomenon in cross-cultural research through a selective literature review. Consideration of ERS differences permitted derivation of 3 logical consequences that pertain to (a) differences in group means, (b) the internal consistency of measures and the correlation among measures, and (c) results of dimensional analyses. Comparison of 187 US and 204 Korean college student samples on a 130-item questionnaire reveals stronger ERS in US Ss. Furthermore, the predictions derived from ERS differences were confirmed, thus demonstrating the credibility of the ERS argument. General implications of ERS for cross-cultural research are discussed. (17 ref)—*Journal abstract*.

11476. Dourley, John P. (Carleton U, St Patrick's Coll, Ottawa, Ontario, Canada) **Trinitarian models and human integration: Jung and Tillich compared.** *Journal of Analytical Psychology*, 1974(Jul), Vol 19(2), 131-150.—Jung and P. Tillich share the conviction that trinitarian symbolism is natural to human consciousness and points toward growth and integration. For Tillich, man's life and religious development are triadic, though disrupted, and participate in the undisrupted triadic life of God. For Jung, the archetypal grounding in the psyche of trinitarian symbolism is closely related to the individuation process and the development of the self. Christ is related to the self as an integrate of conscious life. This can be compared with Tillich's view that man's estrangement from God is conquered in Christ. Tillich holds that evil is a privation of the good and results from man's estrangement, while Jung adheres to the view that the shadow is real, not as a privation, but as an essential part of the whole.—*Journal summary*.

11477. Gallimore, Ronald. (U California, Los Angeles) **Affiliation motivation and Hawaiian-American achievement.** *Journal of Cross-Cultural Psychology*, 1974(Dec), Vol 5(4), 481-491.—Reviewed research which suggests that Hawaiian-American achievement is related to affiliation motivation. Fantasy need affiliation (nAff) was correlated with Scholastic Test of Educational Progress Reading achievement test scores, but not Math achievement scores, for 67 males and females in Grades 9-12. There was no relationship between need for achievement and achievement test scores. The process linking nAff and Hawaiian-American achievement is suggested to involve differential responsiveness to teacher social influence. Results support the view that there are cultural variations in the motivational antecedents of achievement. (17 ref)—*Journal abstract*.

11478. Garrity, Thomas F. (U Kentucky, Medical Coll) **Psychic death: Behavioral types and physiological parallels.** *Omega: Journal of Death & Dying*, 1974(Fal), Vol 5(3), 207-215.—Reports of the psychic death phenomenon are reviewed and grouped into 3 distinct categories on the basis of the quality of behavior antecedent to the death. Deaths following markedly excited behavior, such as fear, grief, and exultation, were placed in the 1st category. Apathetic, withdrawn, and depressed behavior were the death-precursors included in the 2nd category. The 3rd category was characterized by calm acceptance behavior prior to the death. In addition to the presentation of a behavioral typology, parallels between the latter and several hypothesized physiological explanations of psychic death are presented. (60 ref)—*Journal abstract*.

11479. Irwin, Marc H.; Schafer, Gary N. & Feiden, Cynthia P. (U New Mexico) **Emic and unfamiliar category sorting of Mano farmers and U.S. undergraduates.** *Journal of Cross-Cultural Psychology*, 1974(Dec), Vol 5(4), 407-423.—80 nonliterate Mano farmers of Liberia, West Africa, and 100 US undergraduate men were tested on a rice-sorting task appropriate to the Mano cultural setting and an analogous card-sorting task appropriate to the US cultural setting. US Ss performed more card sorts than Mano Ss, while Mano Ss performed more rice sorts than US Ss. A larger drop in performance level was associated with the use of an unfamiliar, as

compared to an emic—or culturally appropriate—sorting task for the US college students than for nonliterate Mano farmers. Both US and Mano Ss most readily sorted by perceptually salient and unidimensional stimulus features and had difficulty shifting sorting dimensions, when tested with an unfamiliar task. US men differed from Mano men in sorting more rapidly on both tasks, and in being more often able to describe verbally the basis for unfamiliar task sorts they had performed. (29 ref)—*Journal abstract*.

11480. Kandiyoti, Deniz. (Middle East Technical U, Ankara, Turkey) **Some social-psychological dimensions of social change in a Turkish village.** *British Journal of Sociology*, 1974(Mar), Vol 25(1), 47-62.—Studied the social-psychological aspects of social change. The total adult male population of a village was interviewed (79 persons). Social-economic and attitudinal variables were intercorrelated and tested for significance. A high degree of coherence was not found among the variables.

11481. Mackie, Marlene. (U Calgary, Alberta, Canada) **Ethnic stereotypes, prejudicial attitudes, and education.** *Alberta Journal of Educational Research*, 1974(Dec), Vol 20(4), 279-292.—Examined the sociological assumption that stereotyping and prejudice are equivalent phenomena by studying the variation of both dimensions of ethnic attitudes by education. 590 Ss completed an open-ended questionnaire and a semantic differential scale. The well-established negative relationship between prejudice and education was affirmed. However, the finding that stereotyping varied directly with education suggests that the cognitive and affective dimensions of ethnic attitudes ought to be conceptually separated and independently measured. (17 ref)—*Journal abstract*.

11482. Marsella, Anthony J. & Quijano, Walter Y. (U Hawaii) **A comparison of vividness of mental imagery across different sensory modalities in Filipinos and Caucasian-Americans.** *Journal of Cross-Cultural Psychology*, 1974(Dec), Vol 5(4), 451-464.—Investigated vividness of imagery across different sensory modalities in 30 Filipino and 30 Anglo-American college students. It was hypothesized that (a) Filipinos would manifest greater vividness of imagery than Anglo-Americans in all sensory modalities, (b) groups would differ with respect to the rank order of scores for vividness of imagery for different sensory modalities, and (c) groups would differ in the interrelationships of vividness of imagery scores among various sensory modalities examined. The 1st 2 hypotheses were partially supported. Results are interpreted in terms of variations in socialization practices between the 2 groups and the implications these practices may have for conditioning personality configurations and linguistic functions that mediate imagery abilities and use. (32 ref)—*Journal abstract*.

11483. Ness, Robert C. & Rohner, Ronald P. (U Connecticut) **The logic of regional testing, and a modified application of that procedure to four hypotheses in the rejection-acceptance project.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 121-122.

11484. Nixon, Charles R. (U California, Los Angeles) **The adaptation of cultural ties to economic development.** *American Behavioral Scientist*, 1974(Sep-Oct), Vol 18(1), 36-58.—Examines how ties to cultural identity are

related to the emergence of new economic class divisions in the complex situation of multicultural societies undergoing economic development. (35 ref)

11485. Ongay, Mario. (Postgraduate Ctr for Mental Health, New York, NY) **The domestic worker in Mexican families: A disturbing factor.** *International Mental Health Research Newsletter*, 1973(Win), Vol 15(4), 13-14.—Points out psychological and sociological implications of the role of the domestic worker in middle- and upper-class Mexican families. It is noted that this role does not help the status of women in a male chauvinistic society. It perpetuates exploitation of women. It does not promote active relationships among family members. The presence of a domestic creates passivity, lack of cooperation, and a poor sense of participation in family tasks. It produces confusion in the child's mind about his relationships and the internalization of an ambiguous, devaluated-omnipotent, close-distant female image. Further, it does not help the formation of a responsible self.—C. A. Heikkinen.

11486. Ramirez, Manuel; Castaneda, Alfredo & Herold, P. Leslie. (U California, Santa Cruz) **The relationship of acculturation to cognitive style among Mexican Americans.** *Journal of Cross-Cultural Psychology*, 1974(Dec), Vol 5(4), 424-433.—Administered tests of cognitive style to 541 Mexican-American children in Grades 1, 4, and 6 and their mothers in 3 communities—traditional, dualistic, and atraditional. Questionnaires on socialization practices and Mexican-American family values were also administered to the mothers. Ss from the traditional community—in which members were most identified with the sociocultural system of Mexican culture—scored in a field-dependent direction. Ss from the atraditional community, whose members are most influenced by mainstream American middle-class values, were most field-independent in cognitive style. Children and mothers of the community influenced by both cultures—the dualistic community—obtained scores between those of the other 2 groups. Mothers from the traditional community were most frequently in agreement with items reflecting indicators of the field-dependent "socialization" cluster, and also with items reflecting the sociocultural system of Mexican-American culture.—*Journal abstract*.

11487. Schnucker, R. V. **The English Puritans and pregnancy, delivery and breast feeding.** *History of Childhood Quarterly: The Journal of Psychohistory*, 1974(Spring), Vol 1(4), 637-658.—Presents a survey of Puritan childbirth and breast-feeding practices in 17th century England, illuminating some of the motivation and fears of parents when having a new baby. Puritans possessed many misconceptions of the physical processes of conception, birth, and nursing, many applying a religious interpretation. Labor pains were a punishment for Eve's sin. The rule that a mother should breastfeed her own child is discussed from the Puritan view as both the law of nature and of God.—J. Carlson.

11488. Smith, Catherine H. (Columbia U, Harlem Hosp Ctr) **Institutional racism: A major urban educational problem.** *Religious Education*, 1974(Nov-Dec), Vol 69(6), 713-727.—Cites selected demographic data and conclusions of commission reports and other documents that indicate continuing racial inequities in the US in

education, juvenile delinquency, and health. Despite some progress in social justice, institutions that were designed to meet consumer needs continue to resist, and by their structures and functions discriminate against, powerless and oppressed minorities. The Christian church is challenged to attack institutional racism and the myth that past progress toward minority justice is satisfactory.—*R. D. Kahoe.*

11489. **Spector, Samuel I.** *The end of days.* *Omega: Journal of Death & Dying*, 1974(Fal), Vol 5(3), 267-276.—Notes that Judaic tradition, from the 10th century BC to the present era, has always attempted to soften the blow of death. In its various aspects, it has engaged both the dying and the remaining living in principles and ceremonies that would make death more acceptable. Of equal importance is the preparation for the end of days through historical, theological, philosophical, and psychological approaches. Most of these avenues are of interest and adaptability to other traditions as well.—*Journal abstract.*

11490. **Vernon, Glenn M. & Waddell, Charles E.** (U Utah) *Dying as social behavior: Mormon behavior through half a century.* *Omega: Journal of Death & Dying*, 1974(Fal), Vol 5(3), 199-206.—Distinguishes between biological, clinical, psychological, and social death. In an analysis of death behavior of Mormons for 50 yrs it was found that their death rate was consistently lower than that of the US and the state of Utah. However, it evidenced essentially the same change patterns as these 2 other populations. Although some biases may be operating in the available statistics, Mormons were shown to be responsive to both their church and their society. Mormonism incorporates somewhat distinctive meanings of death and also a strong health code, both of which it is assumed are related to the identified patterns.—*Journal abstract.*

11491. **Wasson, R. Gordon.** *The role of "flowers" in Nahuatl culture: A suggested interpretation.* *Journal of Psychedelic Drugs*, 1974(Jul-Sep), Vol 6(3), 351-360.—Suggests that references to "flowers" by Nahuatl poets are allusions to hallucinogenic mushrooms. Nahuatl symbols and literary references are interpreted in this light.

11492. **Weick, Karl E. & Gilfillan, David P.** (Cornell U) *The sway and decay of tradition: Individual and group processes in the perpetuation of culture.* *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 189-190.

### Social Issues & Social Processes

11493. **Acosta, Frank X.** (U California, Los Angeles) *Etiology and treatment of homosexuality: A review.* *Archives of Sexual Behavior*, 1975(Jan), Vol 4(1), 9-29.—A review of the major causal theories of and treatment approaches to male and female homosexuality indicates that neither biological, psychoanalytic, or learning and social-learning theories provide convincing evidence for the etiology of homosexuality. All of these accounts, however, provide mixed empirical support for their predictions, with social-learning research presenting the most consistent evidence. Both social-learning and retrospective studies suggest that homosexuality may best be linked to the early qualitative learning and

development of gender identity and gender role. Both psychoanalytic therapy and behavior therapy have minimal successes and many failures; most therapeutic successes seem to be with bisexuals rather than with exclusive homosexuals. The combined use of psychotherapy and specific behavioral techniques offers some promise for heterosexual adaptation with certain kinds of patients. However, better prospects for intervention in homosexuality lie in its prevention through the early identification and treatment of the potential homosexual child. (3½ p ref)—*Journal abstract.*

11494. **Almquist, Elizabeth M.** (North Texas State U) *Attitudes of college men toward working wives.* *Vocational Guidance Quarterly*, 1974(Dec), Vol 23(2), 115-121.—Surveyed 109 male and 120 female undergraduates for attitudes toward working wives. 67.5% of the females and 55% of the males responded to a mailed questionnaire. Results show that (a) over 60% of both men and women generally favored wives' working; (b) both groups regarded wives' working as less desirable if there are preschool children or if luxuries are the aim; (c) women more than men tended to view wives' work roles as supportive of husbands; (d) men both high in favorability (HF) and low in favorability (LF) to working wives had working mothers; (e) LF men preferred high status people-related occupations and had highly educated mothers; HF men preferred entrepreneurial business and managerial occupations and had semi- or unskilled mothers. Overall, more similarity than difference existed between male and female attitudes.—*C. A. Heikkinen.*

11495. **Angst, J.** (Psychiatrischen Universitätsklinik Zürich, Switzerland) *[Analgesics consumption of 19 year old healthy women.]* (Germ) *Schweizer Archiv für Neurologie, Neurochirurgie und Psychiatrie*, 1973, Vol 112(1), 7-19.—Investigated the consumption of analgesics and the influence of Ss' social background and personality characteristics by comparing the data provided by 2 recent studies: one with 1,381 19-yr-old healthy women and the other with 6,313 19-yr-old men. Chi-square tests and phi coefficients were used to determine differences in social background and the Freiburg Personality Inventory, variance analyses, and *t* tests were used to test personality characteristics. Results show that 70% of the Ss used analgesics occasionally. There were correlations between the consumption of analgesics, sleeping pills, and cigarettes but none between analgesics and that of cannabis or alcohol (heavy smokers used more analgesics than light smokers, and stress smokers more than nonstress smokers). The personality dimensions of Ss using analgesics differed from those of nonusers; users had higher values for emotional lability and dysphoria, more neurovegetative and psychosomatic disturbances, dominance tendencies, openness, and aggressivity. The profiles of analgesics and cannabis users differed only insignificantly (cannabis users had more aggressivity). The consumption habits of parents influenced the use of analgesics and, to a lesser degree, also that of sleeping pills and alcohol. Other social factors influencing consumption included availability, group influences, and propaganda. Results support the hypothesis that an unspecific emotional lability causes a general disposition to the consumption, abuse

and even addiction to analgesics, sleep-inducing medicines, nicotine, alcohol, and cannabis.—T. Fisher.

11496. **Asch, Stuart S.** (Mt Sinai Medical School, City U New York) **Some superego considerations in crime and punishment.** *Journal of Psychiatry & Law*, 1974(Sum), Vol 2(2), 159-181.—Examines from a psychoanalytic viewpoint various criminal acts, varieties of criminals, and ways by which the "normal" individual can evade his superego restrictions and commit antisocial acts. The habitual criminal can be considered to have specific defects in both ego and superego. In addition, the aims and effectiveness of current systems of punishment are examined in relation to the psychopathology which they are supposed to correct. Some modifications of existing punishments are suggested which seem more compatible with a psychoanalytic understanding of the individual. (27 ref)—*Journal abstract*.

11497. **Atkins, Richard D.** (Private practice, Philadelphia, PA) **Diversion in drug related cases: A view from the defense.** *Journal of Psychedelic Drugs*, 1974(Jul-Sep), Vol 6(3), 311-314.—Reviews the considerations made by an attorney of an accused drug-abusing client regarding the treatment diversion alternative to criminal prosecution.

11498. **Bahn, Charles.** (John Jay Coll of Criminal Justice, City U New York) **The reassurance factor in police patrol.** *Criminology: An Interdisciplinary Journal*, 1974(Nov), Vol 12(3), 338-345.—Notes that, in addition to its more obvious functions, police patrol has the function of citizen reassurance—providing feelings of safety that a citizen experiences when he knows that a police officer or patrol car is nearby. Since this function is highly related to both visibility and awareness, it is suggested that in locations of both cognitive centrality and high density, fixed posts be established that would both serve the reassurance function and provide another communication link between the police and the public. Recent studies are cited which have contributed to understanding of what S. Milgram (1970) calls "the cognitive map of the city." This concept can be used in the pursuits of safety.—*Journal abstract*.

11499. **Bard, Morton & Zacker, Joseph.** (Graduate School & University Ctr, City U New York) **Assaultiveness and alcohol use in family disputes: Police perceptions.** *Criminology: An Interdisciplinary Journal*, 1974(Nov), Vol 12(3), 281-292.—Notes that systematic naturalistic observation often contradicts experimental laboratory findings and idiosyncratic personal perceptions. In the present study, family disputes managed by police officers trained in interpersonal conflict management yielded uniform observational data on 962 families visited 1,388 times during a 22-mo period. The view shared by police and by social scientists that family disputes are likely to involve assaultiveness and that such behavior is typically caused by alcohol use was not supported by these data. Instead, the findings suggest that (a) assaults do not usually precede arrival of police, (b) disputes are not usually influenced by alcohol use, and (c) assaults are less common when alcohol has been used.—*Journal abstract*.

11500. **Bayer, Istvan.** (National Inst for Pharmacy, Budapest, Hungary) **The abuse of psychotropic drugs.**

*Bulletin on Narcotics*, 1973(Jul-Sep), Vol 25(3), 11-25.—Discusses nontherapeutic uses of therapeutic agents (e.g., amphetamines for "energy" and for mood modification) and overuse or constant use for therapeutic effect. The fact that some agents have a low toxicity contributes to the problem.

11501. **Bayer, Ron.** (Greenwich House Counseling Ctr, New York, NY) **Repression, reform and drug abuse: An analysis of the response to the Rockefeller drug law proposals of 1973.** *Journal of Psychedelic Drugs*, 1974(Jul-Sep), Vol 6(3), 299-309.—Examines reactions to the Rockefeller "get tough" drug law proposals. Public opinion surveys are cited, and the specific responses of criminal justice system professionals, treatment workers, blacks, and political liberals are described.

11502. **Bell, Alan P.** (Indiana U, Inst for Sex Research) **Homosexualities: Their range and character.** *Nebraska Symposium on Motivation*, 1973, Vol 21, 1-26.—Comparisons across groups (under psychiatric treatment vs not under treatment) and within groups (all under treatment whether homosexual or heterosexual) indicate large differences across groups and few differences within groups in both samples. Sample sources were recruited using paid public advertising, mailing lists, and personal contacts in "public places." Persons selected were compared on levels of sexual interest, stimuli, repertoire, problems, and partnerships; acceptance of one's own and others' homosexuality; the degree of "known-aboutness"; and psychological and social adjustments. Despite persisting notions that homosexuality involves primarily a sexual preoccupation, the data indicate that heterosexuals actually have higher levels of sexual interest. Possible etiologies of human sexuality are summarized. (21 ref)—*J. M. Roberts*.

11503. **Boyd, Kenneth M.** (U Edinburgh, Scotland) **Homosexuality and the church.** In J. A. Loraine, *Understanding homosexuality: Its biological and psychological bases*. New York, NY: American Elsevier, 1974. 217 p.

11504. **Brook, Robert; Kaplun, Jack & Whitehead, Paul C.** (Addiction Research Foundation, Lake Erie Region, London, Ontario, Canada) **Personality characteristics of adolescent amphetamine users as measured by the MMPI.** *British Journal of Addiction*, 1974(Mar), Vol 69(1), 61-66.—Compared 60 amphetamine users who were being evaluated for residential or outpatient treatment at the Addiction Research Foundation, London, Ontario, Canada, in 1970-1971 with 24 nonuser Ss, high school student volunteers from the same geographical area, who were tested in 1971. Separate *t* tests were computed for each MMPI subscale to determine user-nonuser differences. Male and female Ss were combined, and the MF subscale was omitted. Most users, and all nonusers, scored within normal limits on the validity triad (L,F,K). Marked differences between users and nonusers appeared both in personal interviews and in the MMPI profiles. Users experience more psychological stress than nonusers, are unstable and insecure. Their psychological problems appear to antedate drug usage. The implications of these findings for treatment are discussed. (15 ref)—*A. P. Balevre*.

11505. Chafetz, Janet S.; Sampson, Patricia; Beck, Paula & West, Joyce. (U Houston) **A study of homosexual women.** *Social Work*, 1974(Nov), Vol 19(6), 714-723. —Reviews the literature and current approaches to treatment of lesbians, and presents preliminary findings of a study based on a nonclinical sample of 51 Ss. The life-styles of the Ss, their problems, views of themselves, relationships with others, and their perceptions of society's reactions to them are explored. Findings indicate that lesbians all too often find the helping professions, as well as a number of American institutions, to be judgmental and nonsupportive of them. This is attributed, at least in part, to the dearth of practical and theoretical literature concerning the female homosexual. (24 ref)—P. O'Brien.

11506. Chodoff, Paul. (George Washington U, Medical School) **Involuntary hospitalization of political dissenters in the Soviet Union.** *Psychiatric Opinion*, 1974(Feb), Vol 11(1), 5-19. —Describes in detail the involuntary hospitalization of a number of Soviet political dissidents, as presented in documents provided to Western psychiatrists in 1971 by Vladimir Bukovsky. The Soviet diagnosis of psychiatric disorder is reviewed in each case, and all but one are judged fallacious. The reactions of Western psychiatrists to the Bukovsky documents and other similar cases, appeals to Soviet authorities, and their failure to influence Soviet practices, are described. The possibility of politically-motivated behavior by US psychiatrists is considered, but the safeguards against it in this country are pointed out.—R. S. Albin.

11507. Clemens, John. **The volatility of voting behaviour.** *Journal of the Market Research Society*, 1974(Oct), Vol 16(4), 291-301. —Describes a theory of voting behavior, relates it to the February 1974 British elections, and attempts to learn how well sample survey data match the theory advanced. Voting behavior is viewed as derivable from the interaction between what is available (the political parties) and voters' perceptions of what is available. Both change, but not necessarily on a one-to-one basis. A synopsis of the workings of voting behavior for an individual is presented, and the question of what decides the saliency of an issue is discussed. The outcome of an election is seen as affected by the saliency of short-term issues. The 1974 election and surveys done prior to it to determine results are summarized, and implications for the next election and for opinion polling in general are offered.—R. S. Albin.

11508. Cooper, Alan J. (St Mary's Hosp. Medical School, London, England) **The aetiology of homosexuality.** In J. A. Loraine, *Understanding homosexuality: Its biological and psychological bases.* New York, NY: American Elsevier, 1974. 217 p.

11509. D'Augelli, Judith F. & Cross, Herbert J. (Pennsylvania State U, Addiction Prevention Lab) **Relationship of sex guilt and moral reasoning to premarital sex in college women and in couples.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 40-47. —Used the Mosher Forced-Choice Guilt Inventory, the Sex Experience Inventory, and Kohlberg's Moral Dilemmas Questionnaire in Exp I to assess 119 unmarried college women with regard to sex behavior, sex guilt, and moral reasoning. Categories of sexual expression

were developed which were useful in predicting behavior. Guilt was a better predictor of sex than morality. Maintaining virginity and losing it were multidetermined. Exp II assessed 76 unmarried college couples on the same variables. Sex guilt and sex experience were associated with moral reasoning for men and for couples. Results suggest that the male partner is more influential than the female in setting standards for the couple. —Journal abstract.

11510. Dawson, John. (U Edinburgh, Scotland) **Urbanization and mental health in a west African community.** In A. Kiev (Ed), *Magic, faith, and healing: Studies in primitive psychiatry today.* New York, NY: Free Press, 1974. xvii, 475 p. \$2.95.

11511. Dearden, John. **Sex-linked differences of political behavior: An investigation of their possibly innate origins.** *Social Science Information*, 1974(Apr), Vol 13(2), 19-45. —Explores the possibility that sex-related differences in political behavior are in part derived from gender-specific innate behavioral predispositions rather than from differential learning experiences and social role expectations. Part 1 reviews data suggesting an innate basis of certain sex-linked behavioral differences; Part 2 attempts to test politically relevant hypotheses derived from findings of Part 1. Results are interpreted as providing only mild support for the hypotheses, though they are logically consistent and noncontradictory to the view expressed in Part 1. (67 ref) —R. Hall.

11512. Earles, James A.; Mullins, Cecil J. & Viola, Bart M. (Lackland Air Force Base, Personnel Research Div, TX) **Variables related to amphetamine use.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 135.

11513. Engelmann, Frederick C. & Schwartz, Mildred A. (U Alberta, Edmonton, Canada) **Austria's consistent voters.** *American Behavioral Scientist*, 1974(Sep-Oct), Vol 18(1), 97-110. —Compares 1968 and 1973 survey data, based on a random sample of Austrian voters, to see if changes in electoral outcomes were associated with changes in the social-structural and interpersonal sources of consistent party support. (18 ref)

11514. Fairburn, Nicholas H. **Homosexuality and the law.** In J. A. Loraine, *Understanding homosexuality: Its biological and psychological bases.* New York, NY: American Elsevier, 1974. 217 p.

11515. Feldman-Summers, Shirley & Kiesler, Sara B. (U Kansas) **Those who are number two try harder: The effect of sex on attributions of causality.** *Journal of Personality & Social Psychology*, 1974(Dec), Vol 30(6), 846-855. —Conducted 2 experiments to ascertain the causal attributions made by a total of 274 male and female undergraduates for identical performance (including success and failure) of males and females. In both experiments, Ss made attributions along 4 dimensions: ability, motivation, task difficulty, and luck. Whether evaluating undergraduates on an intellectual task (Exp I) or successful physicians (Exp II), Ss attributed greater motivation to females than to males. In addition, males perceived the female physician as being less able and having an easier task than the male physician. However, female Ss perceived the female physician as having a harder task than the male

physician. Implications for attribution theory and the perception of professional women in our society are discussed. (17 ref)—*Journal abstract*.

11516. **Fields, Suzanne. Patients' rights: I. Due process of law.** *Innovations*, 1974(Win), Vol 1(2), 12-15. —Discusses legal rights of mental patients, summarizes critical cases, and explores their significance for mental health delivery systems. 3 legal questions are presented: (a) Do the involuntarily committed mentally handicapped have a constitutional right to treatment by the state and what is adequate treatment? (b) Should a patient's work in a hospital be considered therapy (part of the treatment), or should he be reimbursed for involuntary servitude? (c) Does a local board of education have an obligation to provide education for children with alleged mental, behavioral, physical, or emotional handicaps? 5 legal case studies are presented in discussion of these issues.—*J. Carlson*.

11517. **Fields, Suzanne. Patients' rights: II. Lawyers test the limits.** *Innovations*, 1974(Win), Vol 1(2), 16-17. —Describes progress in cooperation between mental health professionals and lawyers to ensure the legal rights of mental patients. The Mental Health Law Project, organized in January 1972, is sponsored by the Center for Law and Social Policy, the American Orthopsychiatric Association, and the American Civil Liberties Union Foundation, and is staffed by lawyers experienced in the field. Besides providing legal assistance and counseling, the project provides a mental health legislation guide, organizes workshops on legal rights of the mentally handicapped, and has analyzed and prepared comments on the new proposed federal rules of evidence as they pertain to the patient-psychotherapist privilege. "Mental Retardation and the Law," a quarterly summary of all litigation relating to the rights of the mentally retarded, and a handbook, "Basic Rights of the Mentally Handicapped," are services provided.—*J. Carlson*.

11518. **Fisher, Gary.** (Cedars-Sinai Medical Ctr, Los Angeles, CA) **Harmful effects of marihuana use: Experiences and opinions of current and past marihuana users.** *British Journal of Addiction*, 1974(Mar), Vol 69(1), 75-84. —Surveyed 530 past and current marihuana users with a 13-page questionnaire designed to elicit their experiences and opinions on the harmful effects of marihuana use. The sample was constituted by using the social network method and random sampling of voter registration lists, predominantly in southern California. Respondents were classified according to 5 use patterns: trial users, past users, occasional, regular, and daily current users. Ss were asked their experiences and opinions with respect to 8 areas related to the dangers of marihuana use: experienced harmful effects; potential dangers to self; type of harm caused to others; potential dangers to society; reasons given by current users for possibly discontinuing use; reasons given by past users for having discontinued use; legal dangers; and types of people to whom users would not recommend the use of marihuana. Generally, respondents did not disparage the use of marihuana in the 8 areas covered by the questionnaire.—*A. P. Balevre*.

11519. **Fisher, Gary; Steckler, Allan; Strantz, Irma & Nabholz, Emily.** (Cedars-Sinai Medical Ctr, Los Angeles,

CA) **The legalization of marihuana: Views of several American populations of users and non-users.** *Journal of Psychedelic Drugs*, 1974(Jul-Sep), Vol 6(3), 333-349. —Re-examines the findings of a 1969-1970 opinion survey of 2,728 adults on their views regarding the liberalization of marihuana laws. It was found that as marihuana use increases, there are more liberal attitudes toward disposition of users and legal control, and an increase in the belief that marihuana will be legalized.

11520. **Freund, Kurt W.** (Clarke Inst of Psychiatry, Toronto, Ontario, Canada) **Male homosexuality: An analysis of the pattern.** In J. A. Loraine, *Understanding homosexuality: Its biological and psychological bases*. New York, NY: American Elsevier, 1974. 217 p.

11521. **Gagnon, John H.** (State U New York, Stony Brook) **Scripts and the coordination of sexual conduct.** *Nebraska Symposium on Motivation*, 1973, Vol 21, 27-59. —Sexual scripts are defined as "culturally provided plans and goals of persons" that shape and coordinate both verbal and nonverbal conduct involved in sexual behavior. One script of a young, inexperienced couple moving from a purely social context to a novice attempt at sexual intercourse is described in detail. From the viewpoint of socialization, its complexity cannot be easily predicted from the Freudian paradigms of developing psychosexuality. The conducts brought into use in this behavior were learned in contexts not related to sexuality. Skills and scripts are detached from the original contexts and add to the flexibility of sexual behavior.—*J. M. Roberts*.

11522. **Glass, Roger; Johnson, Bridget & Vessey, Martin.** (Mt Sinai Hosp, New York, NY) **Accuracy of recall of histories of oral contraceptive use.** *British Journal of Preventive & Social Medicine*, 1974(Nov), Vol 28(4), 273-275. —Compared the oral contraceptive histories obtained from 75 women attending family planning clinics with the information contained in the clinic records to investigate the assumption that women are able to recall their oral contraceptive histories with reasonable accuracy. It is concluded that simple measures of oral contraceptive use, such as whether the preparations have ever or never been used, whether they are in current use, and the total duration of use, are likely to be remembered with adequate accuracy.—*Journal abstract*.

11523. **Grey, Antony.** (Albany Trust, London, England) **Homosexuality: Some social and legal aspects.** In J. A. Loraine, *Understanding homosexuality: Its biological and psychological bases*. New York, NY: American Elsevier, 1974. 217 p.

11524. **Gunderson, E. K.; Nail, Richard L. & Kolb, Douglas.** (US Naval Health Research Ctr, San Diego, CA) **Health status of drug abusers as measured by the Cornell Medical Index.** *Journal of Community Psychology*, 1975(Jan), Vol 3(1), 58-67. —Investigated the mental health status of heavy users of marihuana, amphetamines, hallucinogens, and heroin in a population of young Navy men. The Cornell Medical Index Questionnaire provided a summary of presenting complaints and the patient's medical history. The 195 items have been widely used to survey the prevalence of somatic and emotional symptoms in a variety of populations. Ss were 903 drug users on active duty with the Navy, 1,422

psychiatric inpatients and outpatients tested at major Naval hospitals and clinics, and 725 men who had been examined for special Naval programs and were generally superior in health status. Results show a prominence of psychiatric symptoms among the drug use population. Furthermore, heavy multiple drug use was associated with disease or dysfunction in a number of specific organ systems, i.e., eyes, liver, respiration, digestion, circulation, and muscles and joints. (29 ref)—R. S. Albin.

11525. Hall, Malcolm C. (Commonwealth Police Force, Narcotics Section, Canberra, ACT, Australia) **Problems in legislating against abuse of hallucinogenic fungi in Australia.** *Bulletin on Narcotics*, 1973(Jul-Sep), Vol 25(3), 27-36.—Discusses legislative proposals that possession of specific chemicals, of preparations or extracts containing them, or of the fungi presumed to contain them, should be made a criminal offense. The drawbacks of defining such substances too narrowly are pointed out.

11526. Halleck, Seymour L. (U North Carolina, Medical School, Chapel Hill) **Society: The roots of dependency.** In *Selected papers delivered at The Ninth Annual West Virginia School on Alcohol and Drug Abuse Studies, June 17-22, 1973*. Morgantown, WV: West Virginia University, 1973. 165 p.—Discusses the major reasons why people, especially youth, use drugs which caused dependency and considers some of the environmental situations conducive to drug abuse: permissiveness, freedom, social and technological change, restlessness, altered sense of values, and personal isolation.

11527. Joesting, Joan & Joesting, Robert. (Salisbury State Coll) **Attitudes about sex roles, sex, and marital status of anti-Nixon demonstrators, comparison of three studies.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1049-1050.—Comparison of findings across 3 small studies of 10%, 6%, and 22% of an estimated attendance at anti-Nixon demonstrations showed a sex difference of greater liberalism of the women's attitudes toward their own roles.

11528. Kenyon, F. Edwin. (Warneford Hosp, Oxford, England) **Female homosexuality: A review.** In J. A. Loraine, *Understanding homosexuality: Its biological and psychological bases*. New York, NY: American Elsevier, 1974. 217 p.

11529. King, Marc R. & Manaster, Guy J. (U Texas, Austin) **Time perspective correlates of collegiate marijuana use.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 99.—Data from 26 undergraduate marihuana users and 48 nonusers who completed the Time Reference Inventory show that users were significantly more past-oriented than nonusers. No significant differences in present or future orientations or age and sex variables were found.

11530. Klyman, Fred I. & Kruckenberg, Joanna. (Wichita State U) **A methodology for assessing citizen perceptions of police.** *Journal of Criminal Justice*, 1974(Fal), Vol 2(3), 219-233.—Developed and administered a scale to 1,000 residents of a Kansas community to determine perceptions that residents hold toward their police. Race and dogmatism were examined as variables influencing perceptions. Nonwhite residents evaluated police less favorably than did whites. No significant difference was found on level of dogmatism in evaluating

the police. The importance of assessing citizen perceptions of the police to obtain data which will optimize the setting of goals for police-community relations programming is discussed. (23 ref)—*Journal abstract*.

11531. Knopf, Andrea & Wakefield, John. (U Hosp of South Manchester, England) **Effect of medical education on smoking behaviour.** *British Journal of Preventive & Social Medicine*, 1974(Nov), Vol 28(4), 246-251.—Compared the smoking behavior, knowledge, and opinions of 658 medical students with those of 288 law students based on questionnaire data. Results indicate that medical students had more knowledge than law students about the hazards of smoking, were more convinced by the relevant evidence, and assessed the risk to health more highly. However, there was no significant difference in their smoking behavior. Among medical students, 61% were nonsmokers, 10% ex-smokers, and 29% smokers, of whom three-fifths smoked regularly. During their training they were more likely to start smoking than to give it up, and more likely to increase their consumption than decrease it. Expansion of smoking occurred especially in the early years of the course, whereas the main increase in knowledge was in the clinical period. Students' knowledge and their opinion of the evidence were related to their stage of education, whereas their assessment of the risk was linked with their smoking behavior. It is suggested that expansion of smoking at medical school may be forestalled by providing information about the hazards as early as possible, although some smokers will continue the habit irrespective of knowledge.—*Journal abstract*.

11532. Kosviner, Adele; Hawks, David & Webb, M. G. (Inst of Psychiatry, Addiction Research Unit, London, England) **Cannabis use amongst British university students: Prevalence rates and differences between students who have tried cannabis and those who have never tried it.** *British Journal of Addiction*, 1974(Mar), Vol 69(1), 35-60.—Studied incidence of 1969-1971 marihuana usage by students at 3 selected colleges in southern England and differences between users and nonusers. Questionnaires were sent to the whole student body at the 2 all-male colleges, and at the coeducational college random sampling ensured adequate female response. Response rate to the 7,897 questionnaires was 75%. The study's main areas of interest, the design of the questionnaire, and the statistical methods used in analyzing the data, are described in detail. 67% of the Ss reported that they had never used marihuana. Men used marihuana only slightly more than women. More users than nonusers were brought up outside the United Kingdom, especially in the US. The more independent a student's living arrangements, the more likely he was to have used the drug. (24 ref)—A. P. Balvire.

11533. Lelental, Stefan. (U Łódź, Poland) **[Sentencing in cases of unintentional crimes.]** (Polh) *Przegląd Penitencjarny i Kryminologiczny*, 1972, Vol 10(2), 3-19.—Studied 125 cases of unintentional crime, using questionnaires and documents. 44% of the crimes were committed under the influence of alcohol, and 62% involved manslaughter. 44% of the offenders were vehicle drivers, 26% had served previous prison sentences, and 78% were under 35 yrs old. The modal sentence was 2 yrs. Only 16% of the offenders considered that their

sentences were fair and deserved. (French summary) (24 ref)—A. Z. Arthur.

11534. Lerner, Steven E. & Linder, Ronald L. (San Francisco Polydrug Project, CA) **Drugs in the elementary school.** *Journal of Drug Education*, 1974(Fal), Vol 4(3), 317-322.—Administered a questionnaire about the use of 12 types of drugs to 69 4th graders, 63 5th graders, and 62 6th graders in a suburban elementary school. A general trend of greater use of tobacco, marihuana, beer and wine, hard liquor, amphetamines, barbiturates, codeine, and methaqualone was evident and increased with grade level. Significant differences between 4th graders and the 5th and 6th graders were found in the use of inhalants (23.1% vs 11.1% and 8%, respectively). Marihuana was cited by 11.5% of all Ss as the most available drug for purchase. 58.3% believed that students use drugs "to be part of the gang." Findings substantiate the extensive use of certain psychoactive drugs (beer and wine and inhalants) by 4th graders and suggest the need for drug education programs at the kindergarten or 1st-grade level.—L. Gorsey.

11535. Levenberg, Stephen B.; Heckel, Robert V. & Wagner, Mervyn K. (U South Carolina) **Smoking habits of smoking researchers: Missionaries or hypocrites?** *Psychological Reports*, 1974(Dec), Vol 35(3), 1085-1086.—A survey of the smoking behavior of researchers who produce literature related to smoking indicates that their current rate of cigarette consumption did not differ from the national rate or that of a comparison group of researchers. Differences were found in the current rate of cigar and pipe smoking and in the speed with which smoking researchers are ceasing the habit.

11536. Lewis, Robert A. & Burr, Wesley R. (Pennsylvania State U) **Premarital coitus and commitment among college students.** *Archives of Sexual Behavior*, 1975(Jan), Vol 4(1), 73-79.—A questionnaire survey of 2,453 undergraduates from 4 geographical areas in the US suggests that there is a behavioral pattern of "permissiveness with commitment." This pattern of "coitus with commitment" was evident not only for females, but for males as well. With minor exceptions, the pattern was detected for both sexes in all 4 geographical regions. Speculation is made about ways in which this pattern may be one outcome of the alleged intersex convergence in sexual attitudes and behavior among American college youth. (23 ref)—*Journal abstract*.

11537. Loraine, J. A. (Ed.). (MRC External Scientific Staff, U Edinburgh, Scotland) **Understanding homosexuality: Its biological and psychological bases.** New York, NY: American Elsevier, 1974. 217 p.—Presents a collection of 9 articles on male and female homosexuality. Major topics include psychological, biological, and endocrinological factors in the etiology of homosexuality; religious and legal aspects; and the current role of homophile organizations.

11538. Loraine, John A.; Chew, Iain & Dyer, Tim. (MRC External Scientific Staff, U Edinburgh, Scotland) **The population explosion and the status of the homosexual in society.** In J. A. Loraine, *Understanding homosexuality: Its biological and psychological bases*. New York, NY: American Elsevier, 1974. 217 p.

11539. Lucas, Wayne L.; Grupp, Stanley E. & Schmitt, Raymond L. (Iowa State U) **Longitudinal research and marijuana smoking: A successful approach.** *Criminology: An Interdisciplinary Journal*, 1974(Nov), Vol 12(3), 315-327.—Noting the recognized need for longitudinal research concerning drug use, the specific methods used in a successful longitudinal study of marihuana experience are reported. Of those qualifying for inclusion in the study (128 college students who did not smoke marihuana) only 1 S refused to be interviewed at the initial contact, and 94% cooperated at the recontact 2 yrs later. The probable factors responsible for this success are described, including details regarding preparation prior to the study, approaching the S, establishing rapport at initial contact, and maintaining rapport throughout the study. It is noted that 17% of Ss reported some marihuana experience at the end of the 2-yr interval. (17 ref)—*Journal abstract*.

11540. Luscutoff, Sidney A. & Elms, Alan C. (U California, Davis) **Advice in the abortion decision.** *Journal of Counseling Psychology*, 1975(Mar), Vol 22(2), 140-146.—Examined several aspects of the abortion decision beyond demographic data, particularly the number and kinds of contacts-for-advice made by women confronted with the decision. Ss were 224 therapeutic abortion patients aged 13-41 yrs, 71 obstetrics patients aged 15-35 yrs, and 201 nonhospitalized control Ss aged 16 to over 27 yrs. Ss were asked to report the number of contacts-for-advice they had made when forming decisions to have a therapeutic abortion, to carry a pregnancy to term, or to engage in a significant behavior that did not involve a pregnancy. All Ss were asked to report the difficulty they had in making their respective decisions and the satisfaction they felt with their decisions. As predicted, the abortion group differed strongly from both other groups on most questions. Abortion patient contacts-for-advice also differed from those reported by N. H. Lee's (1969) Ss, but in a direction opposite the predicted one: Lee's reported contacts-for-advice were more numerous than those in the present study. Differences are discussed in light of current social feelings toward abortion and conditions which may have influenced the amount of information upon which Ss had to base their decisions.—*Journal abstract*.

11541. Melinek, Stanley J. (Fire Research Station, Borehamwood, England) **A method of evaluating human life for economic purposes.** *Accident Analysis & Prevention*, 1974(Oct), Vol 6(2), 103-114.—Describes a method of estimating a monetary value of life which can be used for the evaluation of safety precautions, based on the idea that people are willing to spend money to reduce the risk of accidents or, alternatively, to increase the risk for some benefit. The method attempts to estimate the value of life which is consistent with such behavior. Examples of the application of this method are given which indicate that the value of a life is of the order of £50,000. Results are compared with values given by discounted earnings. The importance of perceived risk is also considered, and factors influencing perceived risk are discussed. (French & German summaries) (32 ref)—*Journal summary*.

11542. Milstein, Stephen L.; Pihl, Robert O. & Smart, Reginald G. (Inst Nationale de la Recherche Scientifique-Santé, Montreal, Canada) **The problem of drug abuse: Has Canada found some answers?** *Canadian Psychologist*, 1974(Oct), Vol 15(4), 357-367.—Critically discusses the findings and recommendations of a Canadian government-sponsored study which examined the extent of the nonmedical drug use problem, principal views on treatment, and suggestions for the control of cannabis. 2 major issues are considered: (a) the use of criminal law to control the availability of nonmedical drugs and the user's attempts to obtain them, and (b) the advisability of opiate maintenance programs. (French abstract)—*Journal abstract*.

11543. Monahan, John & Cummings, Lesley. (U California, Program in Social Ecology, Irvine) **Prediction of dangerousness as a function of its perceived consequences.** *Journal of Criminal Justice*, 1974(Fal), Vol 2(3), 239-242.—Investigated 1 of the factors hypothesized to account for overprediction—differential consequences to the individual whose violence is being predicted. Undergraduate Ss were presented with descriptions of personality characteristics which had previously been judged by psychiatrists to indicate dangerousness. In Condition 1 Ss were told that a prediction of dangerousness would lead to another's mental hospitalization, and in Condition 2 they were told that such prediction would lead to a prison sentence. Results support the hypothesis that predictions of dangerousness are at least in part a function of the consequences of the prediction: Ss were more likely to predict another to be dangerous if the prediction would lead to his mental hospitalization than if it would lead to his imprisonment.—*Journal abstract*.

11544. Mullins, Cecil J.; Vitola, Bart M. & Michelson, Alan E. (Lackland Air Force Base, Personnel Research Div, TX) **Variables related to preserve cannabis use in a sample of Air Force enlistees.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 134.

11545. Newman, Graeme R.; Articulo, Donald J. & Trilling, Carol. (State U New York, School of Criminal Justice, Albany) **Authoritarianism, religiosity and reactions to deviance.** *Journal of Criminal Justice*, 1974(Fal), Vol 2(3), 249-259.—Administered a modified version of the California F Scale and a deviance-control scale to 116 police science students and to 91 university students. No overall relationship was found between respondents' preference to control deviance and their authoritarianism, nor did the F Scale discriminate between the 2 groups. However, the police sample favored the control groups. Evidence of response bias of deviance significantly more. Evidence of response bias to the F Scale was also found. It is concluded that the source of the criminal sanction usually typified as moral indignation was more a cognitively based evaluation than an emotionally based reaction. (22 ref)—*Journal abstract*.

11546. Ottenberg, Perry. (U Pennsylvania) **Bureaucratic attitudes as a psychosocial defence.** *Psychiatric Opinion*, 1974(Feb), Vol 11(1), 26-35.—Discusses widespread tendencies in many developed countries to ignore the issue of political dissent and its treatment in the USSR. The problem also exists in a modified form in the US and elsewhere. Bureaucratic factors leading to the

involuntary confinement of dissidents include the proliferation of red tape that precludes quick or rational release for anyone; dehumanization; inability to oppose dominant group attitudes or pressures; rationalizations that others in power know more than the psychiatrist; the devaluation of moral values; and confusion of health ethics and morality. 8 available ways to assist political dissenters in the hospital are described.—R. S. Albin.

11547. Parfrey, P. S. (University Coll Cork, Ireland) **Factors associated with undergraduate alcohol use.** *British Journal of Preventive & Social Medicine*, 1974(Nov), Vol 28(4), 252-257.—Conducted a survey of 265 male and 179 female undergraduates to examine the extent and prevalence of intoxicant use and the various factors associated with their use. 20% of males and 36% of females reported that they did not drink, whereas 52% of males and 17% of females were social drinkers or occasional drunks. Student patterns of drinking behavior were significantly associated with sociocultural factors, such as leisure money available, belief in a God, and frequency of attendance at religious services. Current cigarette use, experience of marihuana, and attitude to future marihuana use, to the opposite sex drinking, and to the misdemeanor considered most serious also had significant associations with alcohol-related behavior. It appears that peer group pressures, as illustrated by the proportion of close friends drinking and sibling drinking, had a greater influence on student drinking behavior than family-related factors such as parental drinking and parental knowledge of drinking. The effect of ambivalent attitudes towards alcohol use, demonstrated by the age at introduction and the place of introduction to alcohol, may suggest that a more relaxed attitude to alcohol should be adopted.—*Journal abstract*.

11548. Parsons, Robert J. & Hoppe, Edward W. (Brigham Young U) **The polarity of political preferences of clergymen.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 123.

11549. Quinsey, Vernon L. (Mental Health Ctr, Oak Ridge Div, Penetanguishene, Ontario, Canada) **Psychiatric staff conferences of dangerous mentally disordered offenders.** *Canadian Journal of Behavioural Science*, 1975(Jan), Vol 7(1), 60-69.—Studied 39 consecutive staff conferences held in a maximum security psychiatric institution to discuss patients who had been remanded by the courts for observation. Each conference participated by the courts for observation. Each conference participated by the courts for observation. Each conference participated by the courts for observation. The panel rated each patient on a number of variables. The degree of rated mental illness was positively correlated ( $p < .002$ ) with the amount of rated patient dangerousness. Most remanded patients were seen as fit for trial and responsible for their crimes, and the conference decisions reflected this. There were significant differences among attendants, physicians, and other professional staff in their ratings of the patients. (15 ref)—*Journal abstract*.

11550. Ramsay, Ronald W.; Heringa, P. M. & Boorsma, I. (U Amsterdam, Psychological Lab, Netherlands) **A case study: Homosexuality in the Netherlands.** In J. A. Loraine, *Understanding homosexuality: Its biological and psychological bases*. New York, NY: American Elsevier, 1974. 217 p.

11551. Rogers, Rita R. (Harbor General Hosp, Torrance, CA) **Psychiatric hospitalization of political**

**dissenters.** *Psychiatric Opinion*, 1974(Feb), Vol 11(1), 20-24. —Considers psychiatric hospitalization of political dissenters as a severe abuse of the concept of psychiatric illness. The political, moral and social implications of this problem make it difficult to handle. It is suggested that the profession should take a stand not on whether those hospitalized are psychiatrically ill or whether their dissent is legitimate, but only on the question of whether their hospitalization is due to political dissent.—R. S. Albin.

11552. **Salzman, Carl & Lieff, Jonathan.** (Harvard U, Medical School, Massachusetts Mental Health Ctr, Boston) **Interviews with hallucinogenic drug discontinuers.** *Journal of Psychedelic Drugs*, 1974(Jul-Sep), Vol 6(3), 329-332.—Examines reasons for drug use as reported by 16 drug discontinuers. Ss were given a drug questionnaire, a battery of psychological tests, and a loosely-structured interview focusing on their involvement with hallucinogens. The interviews indicate 3 clearly defined periods of drug involvement: initiation, heavy drug use, and discontinuance. A frequent correspondence between the phase of drug use and the stage of conflict resolution of an S's personal problem is noted. Ss cited emerging life decisions and resolution of personal and interpersonal conflicts as the basis for their initial drug use. Drugs became less important to Ss as their major life issues were resolved.—R. Tomasko.

11553. **Saxe, David B. & Kuvin, Seymour F.** (City of New York Dept of Consumer Affairs, NY) **Notes on the attorney-client relationship: A psychological overview.** *Journal of Psychiatry & Law*, 1974(Sum), Vol 2(2), 209-216.—Discusses problems that an attorney may face in everyday legal practice, resulting from his own emotional problems, that may have a detrimental effect on the conduct of a successful practice. Various examples are provided as a checklist and warning guide for the perceptive attorney. It is concluded that a successful attorney-client relationship necessitates an emotional alertness on the part of the attorney to his own difficulties.—*Journal abstract.*

11554. **Schill, Thomas; Evans, Ron; Monroe, Scott & Drain, Dennis.** (Southern Illinois U, Carbondale) **Effects of approval or disapproval on reading behavior of high- and low-guilt subjects.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 104.—Hypothesized that censure would enhance viewing of an erotic magazine for low- but not for high-guilt Ss. In contrast to the prediction, mean viewing time for high-guilt Ss was significantly higher in the positive and negative comment conditions than in the neutral conditions, while the viewing time of low-guilt Ss in the positive and negative conditions did not significantly differ from the neutral condition.

11555. **Schneider, William.** (Harvard U) **Issues, voting, and cleavages: A methodology and some tests.** *American Behavioral Scientist*, 1974(Sep-Oct), Vol 18(1), 111-146.—Proposes 2 tests for measuring issue characteristics and their effect on voting behavior: (a) divisiveness, which analyzes the degree to which an issue divides public opinion and creates political cleavages; and (b) political direction, which indicates how clearly parties and candidates are identified with positions on an issue. These tests are applied to the 1968 and 1972 elections.

11556. **Schwartz, Steven.** (Northern Illinois U) **Effects of sex guilt on word association responses to double-entendre sexual words.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 100.—Hypothesized that high-sex-guilt and low-sex-guilt male undergraduates would not differ in their knowledge of the sexual meaning of double-entendre words but rather in their respective orders of associative response production. Data support the hypothesis and show that high-sex-guilt Ss produce sexual responses later in the response hierarchy than low-sex-guilt Ss.

11557. **Silverman, Jerome.** (Private practice, Rosemead, CA) **The women's liberation movement: Its impact on marriage.** *Hospital & Community Psychiatry*, 1975(Jan), Vol 26(1), 39-40.—Discusses marriages in which a basically insecure husband plays a godlike role and his wife, who initially worshipped him, matures and finds her situation depressing and degrading. With support from the women's liberation movement, many women have found the courage and conviction to challenge such situations. The challenges often bring the husbands' repressed feelings of inadequacy to the surface, which leads to increased turmoil and finally to requests for professional help, first by the wife and later by her husband. During counseling both become more open and develop as individuals. As a result their marriage improves.—*Journal abstract.*

11558. **Simon, William.** (Inst for Juvenile Research, Chicago, IL) **The social, the erotic, and the sensual: The complexities of sexual scripts.** *Nebraska Symposium on Motivation*, 1973, Vol 21, 61-82.—Asserts that differences between human sexual pairs of any type are possibly greater than their similarities. The literature on sexual techniques (specifically foreplay) is compared to a car owner's manual explaining how to get a car started on a cold morning. Scripts or scripted behavior suggestive of the dramatic also are inappropriately suggestive of the conventional dramatic narrative form in regard to sexual behavior. The organization of social activity to facilitate sexual behavior and the organization of sexual activity to facilitate nonsexual social and personal goals are compared. Sex research is called "a science of icebergs that is based exclusively upon above-surface observations." (34 ref)—J. M. Roberts.

11559. **Singer, Jack N.** (Colorado State U) **Sex and college class differences in attitudes toward autonomy in work.** *Human Relations*, 1974(May), Vol 27(5), 493-499.—Constructed a homogeneous 20-item "attitude to autonomy in work" scale to evaluate independence needs, and a 6-item scale was constructed to evaluate attitudes toward Women's Liberation. No significant male-female differences were detected among 70 undergraduates in attitudes to autonomy in work, but attitudes among seniors were more positive. Positive attitudes to autonomy were significantly correlated with positive attitudes to the women's movement.—W. W. Meissner.

11560. **Smith, Brian H. & Rodriguez, Jose L.** (Yale U) **Comparative working-class political behavior: Chile, France, and Italy.** *American Behavioral Scientist*, 1974(Sep-Oct), Vol 18(1), 59-96.—Analyzes a number of economic, political, and cultural factors associated with working-class politics. It is concluded that the Franco-Italian pattern of working-class political behavior was

not repeated in Chile before or after Allende's tenure as the 1st Marxist president in Latin America. (95 ref)

11561. Smith, Carolyn B. & Borgers, Sherry B. (U Houston) *Plato's Utopia is yet to come. Vocational Guidance Quarterly*, 1974(Dec), Vol 23(2), 122-127. —Compares the status of women and men in the US in light of Plato's assertion that equality of nurture and education are in the best interests of the state. Research is cited showing that women do not have access to equal education and opportunity, that they are able to commit themselves and to be as productive as men, and that they do not receive equal reward for their efforts. An examination of the results of one large university's affirmative action plan after 3 yrs revealed continued inequalities. It is concluded that Plato's ideal state remains unrealized. (21 ref)—C. A. Heikkinen.

11562. Ungerleider, J. Thomas. (U California, Ctr for the Health Sciences, Los Angeles) *The courts and I: Ruminations, retorts and remnants. Journal of Psychodelic Drugs*, 1974(Jul-Sep), Vol 6(3), 315-320. —Reviews the personal experiences of a psychiatrist involved as an expert witness in drug-abuse cases.

11563. Vidmar, Neil. (U Western Ontario, London, Canada) *Retributive and utilitarian motives and other correlates of Canadian attitudes toward the death penalty. Canadian Psychologist*, 1974(Oct), Vol 15(4), 337-356. —Reports a survey of 144 English Canadian adults which examined the motives behind, and other social psychological correlates of, attitudes toward capital punishment. Results suggest that for a substantial percentage of people, the motive of retribution may be more important than deterrence as a reason for favoring the death penalty. Other findings indicate that the more strongly people favored the death penalty, the more likely they were to score high on measures of authoritarianism, punitiveness, dogmatism, and prejudice (items were used from tests such as the California F Scale and the Rokeach Dogmatism Scale). They were also more likely to be older and less educated. The hypothesis that people who felt threatened by crime would be more likely to favor capital punishment received equivocal support. (French abstract) (40 ref)—*Journal abstract*.

11564. Waller, Julian A.; Lamborn, Kathleen R. & Steffenhagen, Ronald A. (U Vermont) *Marihuana and driving among teenagers: Reported use patterns, effects, and experiences related to driving. Accident Analysis & Prevention*, 1974(Oct), Vol 6(2), 141-161. —Data from 1,271 college freshmen show that 49% reported using marihuana during the previous year. A majority of users simultaneously consumed alcohol at least on occasion, and many of them had enough alcohol at those times to be impaired by the alcohol alone. Among users who smoked weekly or more often, 25% of driving while "high" occurred under the combined effect of marihuana and medium to heavy alcohol use. Most users reported marihuana effects on driving judged to be hazardous (e.g., altered attention, vision, or time perception). In an estimated 15,000 driving trips while "high" on marihuana, 2 crashes occurred definitely attributable to marihuana, 2 possibly attributable to marihuana use. Also, 42 persons (13% of drivers) reported near crashes while "high." Drivers who encountered trouble while driving after marihuana said 59% of the time that the incidents

were caused by the marihuana, 27% by alcohol, and in 14% that they could not assess which drug was responsible. (French & German summaries) (17 ref)—*Journal summary*.

## SOCIAL BEHAVIOR AND INTERPERSONAL PROCESSES

11565. Becker, Henrik & Körner, Wolfgang. (U Hamburg, W Germany) *Cognitive balance and clique formation: A critique and modification of balance theory.* (Germ) *Zeitschrift für Sozialpsychologie*, 1974, Vol 5(3), 189-200. —Discusses J. A. Davis's application of balance theory to the explanation of sociological facts. In order to explore whether "social facts" (in the Durkheimian sense) can be reduced to psychological variables, Davis's theory is modified and put into the form of an axiomatic model. Difficulties in Davis's formulation are demonstrated by incorrect predictions of coalition formation in *n*-person structures. Further modifications of Davis's theory are suggested.—R. P. Abeles.

11566. Diener, Edward et al. (U Illinois) *Effects of altered responsibility, cognitive set, and modeling on physical aggression and deindividuation. Journal of Personality & Social Psychology*, 1975(Feb), Vol 31(2), 328-337. —Assessed the role of 3 disinhibiting variables in producing both physical aggression and an internal state of deindividuation, using 64 male college students as Ss. Altered responsibility, cognitive set, and modeling were manipulated in a factorial design, and all 3 variables significantly increased physical aggression. No interaction produced significant results. The increase due to altered responsibility and varying cognitions supports P. G. Zimbardo's theory of deindividuation which relates certain input variables to wild, impulsive behavior. Questionnaire data indicate that the increase in aggression was not accompanied by internal mediational factors such as reduced self-awareness. It appears that disinhibiting forces may produce increases in antisocial behavior without necessarily producing a deindividuated internal state. (17 ref)—*Journal abstract*.

11567. Hendrick, Clyde. (Kent State U) *Social psychology as history: A bibliography. Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 125-126.

11568. Löhr, Gerhard & Preiser, Siegfried. (U Erlangen, Psychologischen Inst, Nürnberg, W Germany) *[Regression and recreation: A contribution to the problem of stress and rest.]* (Germ) *Zeitschrift für Experimentelle und Angewandte Psychologie*, 1974, Vol 21(4), 575-591. —Investigated the relationship between stress situations and activities during rest periods. 25 psychology students and 36 student nurses were tested on highly complex and very simple tasks. Rest activities consisted of problem solving (high complexity), social games (medium complexity), and doing nothing, or smoking (low complexity). The greatest improvement in a repetition of the original test situation was observed when the rest activity was compensatory to the complexity of the test situation; i.e., doing nothing after a highly complex test, or doing problem solving after an easy test.

The importance of these results for recreational practice is pointed out. (English & French summaries)—*W. J. Koppitz*.

11569. Nelson, Cheryl A. & Hendrick, Clyde. (Kent State U) **Bibliography of journal articles in social psychology: 1973.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 126.

11570. Schmidt, Hans D. & Schmidt-Mummendey, Amélie. (U Bielefeld, W Germany) [Weapons as aggression-eliciting stimuli: A critical inspection of experimental results.] (Germ) *Zeitschrift für Sozialpsychologie*, 1974, Vol 5(3), 201-218.—Criticizes L. Berkowitz's theory of cue-elicited aggression by analyzing experiments on cue-elicited effects of weapons on aggressive behavior. The original experiment by Berkowitz and A. LePage (1967), its replications, and the authors' experiments are discussed with respect to internal and external validity. No experimental evidence of a cue-elicited weapons-effect on aggressive behavior is found. Occasionally observed increases in aggressive behavior after presentation of aggressive cues are interpreted according to the operant conditioning paradigm. (21 ref)—*English abstract*.

#### Group Dynamics & Interpersonal Communication

11571. Adams, W. Clifton. (Central Missouri State U) **The effect of various channels of feedback on the communication of information.** *Speech Monographs*, 1973(Jun), Vol 40(2), 147-150.—Used closed-circuit TV to test whether visual and/or audio responses from a listener increased communication accuracy. 32 dyads were drawn randomly from the male and female populations of the basic speech course at a state university. Analysis of covariance was used to adjust for the influence of interaction time. Findings suggest that the audio channel carried the information necessary to improve communication, and the visual channel provided auxiliary feedback which was inefficacious without the audio. A secondary finding indicates that within feedback conditions accuracy was independent of time.—*Journal abstract*.

11572. Birchler, Gary R.; Weiss, Robert L. & Vincent, John P. (U California, Medical School, San Diego) **Multimethod analysis of social reinforcement exchange between maritally distressed and nondistressed spouse and stranger dyads.** *Journal of Personality & Social Psychology*, 1975(Feb), Vol 31(2), 349-360.—Based on a social learning formulation of marital interaction, the positive and negative social reinforcement behaviors exchanged within a total of 24 distressed marital, nondistressed marital, and stranger dyads were investigated. Behavioral data gathered from home and laboratory interactions were used to study distressed and nondistressed marital interaction. In the laboratory, a repeated measurements design facilitated comparisons of marital and stranger interactions. Results from the natural environment indicate that distressed couples, relative to nondistressed, emitted fewer "pleases" and more "displeases," and engaged in more conflicts and fewer recreational activities together. Laboratory data from a behavioral coding system also indicate that distressed couples engaged in fewer positives and more negatives during casual conversation and problem-solving

than did nondistressed couples. Both distressed and nondistressed married dyads were more negative and less positive than stranger dyads. Theoretical and practical implications of the findings are discussed. (18 ref)—*Journal abstract*.

11573. Bochner, Arthur P. & Kaminski, Edmund P. (Temple U) **Modes of interpersonal behavior: A replication.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1079-1083.—Replicated a portion of M. Lorr and A. Suziedelis' study (see PA, Vol 43:15703) of modes of interpersonal behavior. Lorr's Interpersonal Behavior Inventory was administered to 287 undergraduates. Ss rated well-liked others and themselves. Factor analysis was performed on the 2 correlation matrices and the results were compared to those for Lorr's normal sample. 3 factors were sufficient to account for the variance. 2 major differences between the studies were found. The Nurturance and Sociability factors in the previous study were combined into 1 bipolar factor labeled Hostility-Affection, and the scales comprising the Dependency category seemed considerably reduced in importance.—*Journal abstract*.

11574. Breiger, Ronald L. (Harvard U) **The duality of persons and groups.** *Social Forces*, 1974(Dec), Vol 53(2), 181-190.—Attempts to translate a metaphor of classical social theory concerning the "intersection" of persons within groups and of groups within the individual into a set of techniques to aid in empirical analysis of the interpenetration of networks of interpersonal ties and networks of intergroup ties. These techniques are useful in the study of director interlocks, clique structures, organizations within community and national power structures, and other collectivities which share members. The "membership network analysis" suggested in this paper is compared to and contrasted with sociometric approaches and is applied to a study by A. Davis et al (1941) of the social participation of 18 women. (22 ref)—*Journal abstract*.

11575. Chesebro, James W.; Cragan, John F. & McCullough, Patricia. (Temple U) **The small group technique of the radical revolutionary: A synthetic study of consciousness raising.** *Speech Monographs*, 1973(Jun), Vol 40(2), 136-146.—Attempted to identify the aggregate or central symbols which characterize the different stages in consciousness-raising. 3 consciousness-raising sessions, involving 6, 5, and 4 Gay Liberationists expressing a profound sense of alienation from the establishment, were tape-recorded. Results indicate that in moving through a 4-stage process, participants generally created a new identity for themselves (Stage 1), perceived themselves as pitted against agents of the establishment (Stage 2), denied establishment values for newly created values (Stage 3), and finally agreed to support the liberation efforts of unrecognized oppressed groups, hence broadening the revolution (Stage 4). It is concluded that an examination of consciousness-raising as a small group technique appears to have important implications regarding the reliability, prior reported results, methodology, and future studies of small groups.—*Journal abstract*.

11576. Coutts, Larry M. & Schneider, Frank W. (U Windsor, Ontario, Canada) **Visual behavior in an unfocused interaction as a function of sex and distance.**

*Journal of Experimental Social Psychology*, 1975(Jan), Vol 11(1), 64-77.—Following E. Goffman's (1963) distinction between focused and unfocused interactions, the visual behavior of male, female, and mixed sex dyads in an unfocused interaction (waiting room situation) was investigated. Ss were 40 male and 40 female undergraduates. Amount of visual behavior decreased over time and with increasing proximity of the interactants. While the sex of the looker was not a significant source of variance, females received more glances than males. Also, more glances occurred in female dyads than in either male or mixed sex dyads. The amount of mutual gaze accounted for 1% of the interaction time and did not exceed the level expected by chance. Attention is drawn to the differences in the patterns of visual behavior which occurred in the present unfocused interaction and those which occur in focused interactions. (18 ref)—*Journal abstract*.

11577. Emurian, Henry H.; Bigelow, George E.; Brady, Joseph V. & Emurian, Cleeve S. (Johns Hopkins U, Medical School) **Small-group performance maintenance in a continuously programmed environment.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 187.

11578. Firestone, Ira J.; Lichtman, Cary M. & Colamosca, John V. (Wayne State U) **Leader effectiveness and leadership conferral as determinants of helping in a medical emergency.** *Journal of Personality & Social Psychology*, 1975(Feb), Vol 31(2), 343-348.—Investigated the contribution of an individual's qualification for discussion group leadership (LGD) and the method of leadership conferral (election vs appointment) upon his group's response to a medical emergency. Ss were 156 male undergraduates. It was found that 5-person, face-to-face groups with high-LGD leaders responded more frequently and more rapidly to a confederate member's diabetic reaction than did groups with low-LGD leaders. Low-LGD leaders were frequently overthrown, while groups with high-LGD leaders experienced continuity of leadership. Conferral process had no discernible effect on helping or overthrows. It is concluded that a victim is the more fortunate if his group's leader is assertive. (17 ref)—*Journal abstract*.

11579. Frandsen, Kenneth D. & Rosenfeld, Lawrence B. (Pennsylvania State U) **Fundamental interpersonal relations orientations in dyads: An empirical analysis of Schutz's FIRO-B as an index of compatibility.** *Speech Monographs*, 1973(Jun), Vol 40(2), 113-122.—Conducted a series of studies with a total of 146 Ss (including college students and Civil Service employees) to investigate the potential usefulness of W. Schutz's (1960) theory of interpersonal relations orientations for the study of interpersonal relations. Based on analysis of the descriptive and explanatory power of scores produced by responses to Schutz's instrument, the Fundamental Interpersonal Relations Orientations Scales—Behavior (FIRO-B), the 3-dimensional classification of interpersonal needs is challenged, as well as the argument concerning 3 distinct forms of interpersonal compatibility. Results suggest that FIRO-B may be structurally biased against the interpersonal need to control or be controlled and that the compatibility measures derived from the test, although useful for examining certain broad-gauge predictions, do

not permit intensive analysis of the functional relationship between interpersonal orientations and communicative processes in dyads.—*Journal abstract*.

11580. Hrycenko, Igor & Minton, Henry L. (U Windsor, Ontario, Canada) **Internal-external control, power position, and satisfaction in task-oriented groups.** *Journal of Personality & Social Psychology*, 1974(Dec), Vol 30(6), 871-878.—On the basis of a conceptualized congruency between expected locus of control and preference for locus of control in a given situation, it was hypothesized that in a task-oriented communication network, satisfaction with power position would be determined by the interaction of the personality dimension of internal-external control and the actual degree of power possessed. This hypothesis was tested via an experimental design in which 52 undergraduates, whose goal was to complete a group task with maximum efficiency, were led to believe that they possessed either high or low power in a triadic communication network. All Ss had completed Rotter's Internal-External Control Scale. Ss' responses to a postexperimental questionnaire supported the hypothesis for males but not for females. Results support the conceptualized relation between expected locus of control and preferred locus of control. (17 ref)—*Journal abstract*.

11581. Kawasaki, Michio. (Tokyo U of Education, Japan) **[Functional utilization of speech in group problem solving.]** (Japn) *Japanese Journal of Educational Psychology*, 1974(Jun), Vol 22(2), 80-90.—Compared individual and group performances by 7 groups of college students ( $N = 98$ ) in 2 experiments on matching 9 pairs of nonsense geometric figures, with or without verbalization. Verbalization and naming reduced the number of errors. Problem solving took longer by groups than by individuals in the early stages but less time in the later stages. Effectiveness of group activity depended on verbal communication in reaching agreements. (English summary)—S. Choe.

11582. Killworth, Peter D. & Bernard, H. Russell. (Cambridge U, England) **The Catij Technique: Some descriptive tests of its adequacy.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 188-189.

11583. Knowles, Eric S. & Johnsen, Per K. (U Wisconsin, Green Bay) **Intrapersonal consistency in interpersonal distance.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 124.

11584. London, Manuel & Walsh, W. Bruce. (U Illinois) **The development and application of a model of long-term group process for the study of interdisciplinary teams.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 188.

11585. Martin, Jane W. (Buffalo & Erie County Head Start Program, NY) **Attitudes toward epileptic students in a city high school system.** *Journal of School Health*, 1974(Mar), Vol 44(3), 144-146.—Investigated attitudes toward epilepsy by surveys and interviews of teachers, counselors, and nurses in the Buffalo public high schools. Results indicate a general lack of knowledge and understanding of epilepsy, especially among teachers. Although 5 out of every 100 students were known epileptics many teachers were unaware of the proper response to a child's epileptic seizure. In addition, most

counselors did not deal with the specific vocational and social needs of epileptic students. It is the responsibility of both the public school system and teacher training programs to change attitudes toward epilepsy.—*A. de la Haba.*

11586. Michener, H. Andrew & Lawler, Edward J. (U Wisconsin, Madison) **Endorsement of formal leaders: An integrative model.** *Journal of Personality & Social Psychology*, 1975(Feb), Vol 31(2), 216-223.—Attempted to develop an integrative, path-analytic model for the endorsement accorded to formal leaders. The model contains 4 independent variables reflecting aspects of group structure: group success-failure, the payoff distribution, the degree of support by other members for the leader, and the vulnerability of the leader. Also included are 2 intervening variables reflecting perceptual processes (attributed competence and attributed fairness) and 1 dependent variable (endorsement). Results of an experiment with 144 male undergraduates indicate that endorsement was greater when the group's success was high, when the payoff distribution was flat rather than hierarchical, and when the leader was not vulnerable to removal from office. Other support had no significant impact on endorsement. The effect of success-failure on endorsement was mediated by attributed competence, while the effect of the payoff distributed was mediated by attributed fairness. These results suggest that moral and task evaluations are distinct bases of endorsement. (19 ref)—*Journal abstract.*

11587. Morgan, Cyril P. & Aram, John D. (U Colorado, Coll of Business & Administration) **The preponderance of arguments in the risky shift phenomenon.** *Journal of Experimental Social Psychology*, 1975(Jan), Vol 11(1), 25-34.—Conducted a risky shift experiment with 48 graduate students in 12 4-person groups to study the enhanced-salience-of-values mechanism of R. Brown's (1965) widely held values theory and A. Vinokur's (1971) persuasive argumentation hypothesis. Tape recorded group discussions and written briefs were coded to measure percent risky expression of content of 4 risky and 4 cautious Choice Dilemma Questionnaire problems. Results show significant relationships between percent risky expression and degree of shift by groups and by problems. Results support the enhanced-salience-of-values mechanisms of values theory and the persuasive argumentation hypothesis. (27 ref)—*Journal abstract.*

11588. Moxnes, P. A. & Engvik, H. A. (U Oslo, Inst of Psychology, Norway) **Diagnosing the organization: The psychogram.** *Interpersonal Development*, 1973-1974, Vol 4(3), 177-189.—21 psychologist members of a sensitivity trainer organization evaluated each other according to 20 bipolar adjectives. From a resulting factor analysis came 2 distinct dimensions, interpreted as the "love" and the "will." Scores for all members were plotted within a derived coordinate system, with the aid of a computer program. The emerging "psychogram" is seen as reflecting 4 different modes of group member behavior: The Apathetic, the Sentimentalist, the Manipulator, and the Carer. The significance of each of the group member types is discussed and implications explored. (16 ref)—*Journal abstract.*

11589. Paloutzian, Raymond F. (Claremont Graduate School & University Ctr) **Some consequences of individuation and deindividuation: Aggression and altruism as functions of responsibility and group size.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 124-125.

11590. Phillipsen, Gerry F. & Saine, Thomas J. (U California, Santa Barbara) **The effect of reward criteria on verbal participation on group discussion.** *Speech Monographs*, 1973(Jun), Vol 40(2), 151-153.—Previous studies in speech communication have reported that the presence of a high-status evaluator inhibits verbal participation in group discussion. However, results of the present study with 64 undergraduates suggest that when the status variable is manipulated directly such differences are not observed. Results also suggest that differences in the frequency and quality of participation are linked to differences in reward criteria. Some support was found for the argument that evaluator status may either strengthen or weaken the effects of reward criteria on participation.—*Journal abstract.*

11591. Ryen, Allen H. & Kahn, Arnold. (Iowa State U) **Effects of intergroup orientation on group attitudes and proxemic behavior.** *Journal of Personality & Social Psychology*, 1975(Feb), Vol 31(2), 302-310.—Examined the effects of 5 levels of intergroup orientation on (a) member evaluations of both ingroup and outgroup and (b) proxemic behavior both within and between groups. Ss were a total of 123 male undergraduates. 24 Ss divided into triads were assigned to each condition: alone, coacting, cooperating, competing with no feedback, and competing with win-lose feedback. Members of alone and coacting groups chose random seating patterns, and coacting group members did not differentiate evaluatively between own and other group. Ss in cooperating groups sat near both ingroup and outgroup members, and displayed a slight bias favoring own group. Competing-no-feedback group members sat near other ingroup members but far from outgroup members, rating own group much higher than other group. Winning feedback caused Ss to sit closer to the losing group, relative to no-feedback conditions, while losing groups tended to sit as far from the winning group as possible; winning feedback caused even higher own-group evaluations than in the no-feedback conditions, while losing feedback produced relatively low own-group ratings. Results suggest intergroup orientation provides (a) expectations about involvement with the outgroup and its effects on group goal attainment which influences ingroup and outgroup evaluations and (b) normative information as to how to place oneself with regard to own- and other-group members. (26 ref)—*Journal abstract.*

11592. Shoham, Shlomo G.; Ben-David, Sarah & Rahav, Giora. (Tel Aviv U, Israel) **Interaction in violence.** *Human Relations*, 1974(May), Vol 27(5), 417-430.—Examines the process of eruption of violent acts using a stimulus-response interactional model. Data are based on analysis of court records, content analysis of fictional accounts of violence, role-playing, and descriptions of violent experiences by youth leaders. A subjective grading scale was compiled to evaluate levels of intensity of response. Findings suggest that if the meaning or intent of the 1st cycle of interaction

(provocation, reaction, and their relation) is ambiguous, the interaction will tend to escalate in intensity until the meaning is clarified. If it is perceived as provoking, violence erupts; if neutral or friendly, tension diminishes; if still ambiguous, subsequent cycles will be defined as provoking with violent results.—*W. W. Meissner.*

11593. Silver, Burton B. (Florida Atlantic U) **Group success and personal commitment in game simulations.** *Simulation & Games*, 1974(Dec), Vol 5(4), 415-424.—Used modified version of SIMSOC to test the hypothesis that within a game-simulation context, the greater the group success in a goal-oriented pursuit, the greater the personal commitment to the group. 52 Ss were divided into 3 sets of 4 simulated groups each. Limits were covertly placed on the extent of mobility opportunity in 2 groups. One of these groups experienced status threat while the other group experienced mobility blockage. Results of posttest questionnaires supported the hypothesis but found no relationship between commitment to the original group and achievement of personal goals.—*D. E. Anderson.*

11594. Tajfel, Henri. (U Bristol, England) **Social identity and intergroup behaviour.** *Social Science Information*, 1974(Apr), Vol 13(2), 65-93.—Accepts the frustration-aggression hypothesis of group hostility based upon conflicts but focuses on intergroup relations and not individual behavior. In-group, out-group distinction is necessarily based on belonging. To relate self to group the individual uses categorization, identity, comparison and psychological distinctiveness. It is the awareness of the existence of categories which generates the in-group response, not necessarily past hostility nor objective conflict. Identity within a group is either secure and of lasting nature with change not likely, or insecure and subject to change. Data are cited to indicate that psychological distinctiveness may be enhanced to bolster high status, insecure, group identification. Low status identity, which cannot be changed, leads to defenses, redefinition of groups or the search for change in the situation, or new identity. In these research continuities the individual acts in relation to clearly dichotomized social groups. Self identification is subordinated by the nature of the experimental designs. In the assignment of rewards to unknown parties, Ss respond to the group dichotomies and to permanence of group affiliation, whenever they are aware of the comparisons of differing groups. (54 ref)—*R. J. Anderson.*

11595. Weight, David G. (Brigham Young U) **Interviewer's locus of control and conditioning of interviewee's self-reference statements.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1307-1316.—Conducted a study of 40 male and 40 female undergraduates to explore the relationship between an interviewer's perceived personal control and his effectiveness as a social reinforcer during control and his effectiveness as a social reinforcer during a free verbalization in an interview. The design was a  $2 \times 2 \times 2$  factorial experiment. The experimental variables were the locus of control of both interviewers and Ss, reinforced response class, and sex. Ss were reinforced for the emission of either positive or negative self-references. The following results were obtained: (a) internal interviewers were generally more effective than external interviewers in eliciting positive self-references, (b) verbal reinforcement increased the emission of positive self-

references, (c) negative self-references were relatively unaffected by either internal or external interviewers, (d) internal interviewers had maximum influence when Ss were male, and (e) internal interviewers were significantly more confident about the quality of their relationship with Ss. (17 ref)—*Journal abstract.*

11596. Westfall, Michael P.; Schatzberg, Alan F.; Blumetti, Anthony B. & Birk, C. Lee. (Harvard U, Medical School, Boston) **Effeminacy: II. Variation with social context.** *Archives of Sexual Behavior*, 1975(Jan), Vol 4(1), 43-51.—Videotaped 19 Ss while participating in 4 encounter groups, of which 2 were homosexual and 2 heterosexual. There were large situational variations in expressivity of effeminacy during group meetings. High-frequency levels of effeminate responses were observed to parallel high levels of anxiety or anger. At other times, effeminate responses were observed which seemed to subserve sexual signaling functions or which seemed related to narcissistic retreat (self-cuddling) or castration anxiety (e.g., cupping the genitals). Interrater reliability with the authors' Effeminacy Scale for 2 nonprofessional raters viewing the same videotaped material from the group was .93.—*Journal abstract.*

#### Social Perception & Motivation & Attitudes

11597. Bailey, Roger C. & Helm, Bob. (East Tennessee State U) **Matrimonial commitment and date/ideal-date perceptions.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1245-1246.—Results of perceived intelligence ratings on Date and Ideal Date scales made by college student dating couples were significantly correlated for engaged Ss but not for occasional or steady daters. Results suggest that perceptions of the date's intelligence was similar to an ideal when marriage was contemplated, as hypothesized.

11598. Bell, Paul A. (Purdue U) **Interpersonal attraction as a joint function of primacy and recency effects.** *Memory & Cognition*, 1975(Jan), Vol 3(1), 113-116.—Studied empirical primacy-recency inconsistencies between D. Byrne's reinforcement affect model of attraction and N. H. Anderson's information integration model of personality impression formation. 36 male and female undergraduates gave attraction responses to sequences of blocks of similar and dissimilar attitudes arranged in increasing or decreasing proportions of similarity and increasing or decreasing levels of topic importance. Results generally support the hypothesis that attraction is a joint function of the proportion of similar attitudes within each block (recency) and cumulative proportion of similar attitudes before each response (primacy). This joint occurrence of primacy and recency effects was interpreted in terms of an affect neutralization hypothesis. (17 ref)—*Journal abstract.*

11599. Buckhout, Robert. (Brooklyn Coll, Ctr for Responsive Psychology, City U New York) **Eyewitness testimony.** *Scientific American*, 1974(Dec), Vol 231(6), 23-31.—Discusses factors which limit a person's ability to give an accurate description of events he witnessed and of the people involved. Sources of unreliability are frequently inherent in the original situation, in the witness himself, and in the circumstances attending the attempt at information retrieval. Reported research

documents the unreliability of eyewitness testimony.—P. Tolin.

11600. Cladini, Robert B. et al. (Arizona State U) **Reciprocal concessions procedure for inducing compliance: The door-in-the-face technique.** *Journal of Personality & Social Psychology*, 1975(Feb), Vol 31(2), 206-215.—Conducted 3 experiments to test the effectiveness of a rejection-then-moderation procedure for inducing compliance with a request for a favor. Ss were a total of 202 passersby on a university campus. All 3 experiments included a condition in which a requester first asked for an extreme favor (which was refused to him) and then for a smaller favor. In each instance, this procedure produced more compliance with the smaller favor than a procedure in which the requester asked solely for the smaller favor. Additional control conditions in each experiment support the hypothesis that the effect is mediated by a rule for reciprocation of concessions. Several advantages to the use of the rejection-then-moderation procedure for producing compliance are discussed. (15 ref)—*Journal abstract*.

11601. Cook, Mark & Smith, Jacqueline M. (University Coll Swansea, Wales) **Group ranking techniques in the study of the accuracy of interpersonal perception.** *British Journal of Psychology*, 1974(Aug), Vol 65(3), 427-435.—Conducted 3 experiments with a total of 124 students to examine theoretical and methodological problems in the study of the accuracy of interpersonal perception. It is suggested that one set of problems, known "Cronbach's components," arise from the use of arbitrary numerical scales, and the other—response set artifacts—arise from uneven distributions of responses on multiple-choice questionnaires or in rating scales. It is also suggested that a group ranking technique—in which Ss within a group rank each other on a continuous dimension—will avoid both these sets of artifacts. Preliminary data, using the 4 dimensions of extraversion, neuroticism, authoritarianism, and intelligence, indicate that Ss ranked others on extraversion with some accuracy but were poor at ranking others on intelligence and neuroticism. Their success at ranking others for authoritarianism depended on the spread of authoritarianism scores. The significance of these results is discussed. (26 ref)—*Journal abstract*.

11602. Fink, Edward L. et al. (Michigan State U) **The effects of family occupational type, sex, and appeal style on helping behavior.** *Journal of Experimental Social Psychology*, 1975(Jan), Vol 11(1), 43-52.—Used a campus blood donation drive to examine the variables of family occupational type as a milieu for the socialization of altruism, appeal style stressing equity or dependency, and sex-role attitude (traditional and nontraditional) in influencing helping behavior. Ss were 63 undergraduates. No effects were found for family occupational type dichotomized as bureaucratic and entrepreneurial. Males but not females responded to an appeal based on equity more than to an appeal based on the dependency of others. Among Ss of both sexes with nontraditional sex-role orientation, response to both appeals was similar, while among those of traditional sex-role orientation, response to the appeal of equity was much greater than to the appeal of dependency. Implications of the current

restructuring of sex roles for altruism are indicated. (18 ref)—*Journal abstract*.

11603. Graham, John R. et al. (Kent State U) **The Home Environment Perception Scales.** *Journal of Community Psychology*, 1975(Jan), Vol 3(1), 40-49.—Constructed and used 4 forms of the Home Environment Perception Scales with expatrients and informants to describe the expatrients' home environment and significant other people in the environment as they relate to the patient. It was found that expatrients and informants utilized very similar dimensions in describing the environment. Factor analysis results show that 5 scales were underlying the 2 forms for assessing the home and 7 scales underlying the 2 forms for assessing significant other people. In addition, when factor scores for 366 expatrients and informants were compared, similarity between perceptions of home were found, supporting the results of earlier correlational analysis.—R. S. Albin.

11604. Hamm, Norman H.; Baum, Michael R. & Nikels, Kenneth W. (U Nebraska, Omaha) **Effects of race and exposure on judgments of interpersonal favorability.** *Journal of Experimental Social Psychology*, 1975(Jan), Vol 11(1), 14-24.—2 experiments replicated and extended the "mere exposure" effect across the variables of race, sex, and level of initial favorability. Both experiments employed a between-Ss design in which 40 white undergraduates rated their favorability toward 20 photographs, 10 of black and 10 of white college graduates. The initial exposure sequence was followed by 10 repetitions of each photograph for experimental Ss and an inverted alphabet printing task for control Ss. During the posttest all Ss again rated the photographs. Irrespective of race and sex of photograph or initial level of favorability, exposure functioned to enhance interpersonal attractiveness in both experiments. (18 ref)—*Journal abstract*.

11605. Hendrick, Clyde. (Kent State U) **Bibliography of research on impression formation and related topics.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 128.

11606. Houston, B. Kent & Warner, Marsha O. (U Kansas) **Reducing stress by counterattitudinal advocacy.** *Journal of Research in Personality*, 1974(Dec), Vol 8(4), 350-360.—In an experiment with 44 male undergraduates, 1 group of Ss were made apprehensive by being threatened with shock and then were induced to publicly argue that they were not apprehensive about the situation. Apprehension was measured by the Affect Adjective Check List. It was hypothesized that the Ss who were induced to advocate a position contrary to their feelings about the situation would experience dissonance. To reduce dissonance, these Ss were expected to redefine the situation as less threatening and thereby experience less apprehension regarding the situation than subjects in a control threat condition. Results of physiological measures and a postexperimental questionnaire support the expectations. (24 ref)—*Journal abstract*.

11607. Innes, John M. & Young, Roger F. (U Edinburgh, Scotland) **The effect of presence of an audience, evaluation apprehension and objective self-awareness on learning.** *Journal of Experimental Social Psychology*, 1975(Jan), Vol 11(1), 35-42.—Tested social

facilitation and objective self-awareness theories of audience effects on individual performance by having male and female undergraduates perform a learning task (mirror drawing) (a) either alone or before a nonevaluative audience, (b) before a mirror or not, and (c) either with or without an emphasis on the evaluation of individual performance. Results suggest that the presence of an audience with little explicit evaluative function produces slower performances than those of Ss behaving alone. This occurred even in the condition which minimized the importance of the S's own performance. Data support a hypothesis of the anticipation of outcomes rather than one which suggests that mere presence results in a general quickening of behavior. Evidence also indicates that an audience and a mirror combine to produce a pattern which supports neither the social facilitation or objective self-awareness theories.—L. Gorsev.

11608. Jacobson, Dan. (Tel-Aviv U, Israel) **Rejection of the retiree role: A study of female industrial workers in their 50's.** *Human Relations*, 1974(May), Vol 27(5), 477-492.—Studied attitudes toward retirement among 145 male (mean age 60.2 yrs) and 70 female (mean age 56.8 yrs) semiskilled factory workers in the vicinity of London. Female Ss were less favorable to retirement than males; work-based social ties were the chief correlate of the wish to continue working. Implications for retirement policies, particularly earlier retirement age for women, are discussed. (23 ref)—W. W. Meissner.

11609. Johnson, David W. (U Minnesota) **Cooperativeness and social perspective taking.** *Journal of Personality & Social Psychology*, 1975(Feb), Vol 31(2), 241-244.—The ability to take the perspective of other individuals is commonly assumed to be one of the most important aspects of cooperative interaction. While a number of theorists have posited that cooperativeness and social-perspective-taking are highly related, there is no direct evidence confirming such an assumption. In the present study, 24 4th graders were given a series of tasks indicating predisposition to cooperate and ability to take the perspective of other individuals both physically and emotionally. Results indicate that there was no relationship between predisposition to cooperate and ability to take the physical perspective of other individuals, but there was a strong relationship between predisposition to cooperate and ability to take the emotional perspective of other individuals. No relationship was found between ability to take the physical and emotional perspective of other individuals. Results confirm a basic theoretical assumption in cooperation theory and empirically link the research and theory on cooperation and social development.—*Journal abstract.*

11610. Johnson, Douglas A. (U California) **Equity theory and overpayment: The behavior of children of differing socioeconomic backgrounds.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 186-187.

11611. Krebs, Dennis & Adinolfi, Allen A. (Simon Fraser U, Burnaby, British Columbia, Canada) **Physical attractiveness, social relations, and personality style.** *Journal of Personality & Social Psychology*, 1975(Feb), Vol 31(2), 245-253.—Investigated the relationship between physical attractiveness, social contact with members of the same and opposite sex, and personality

factors, using 60 male and 60 female university freshmen who were rejected, accepted, or unknown to their same-sex peers. A reliable rating of physical attractiveness by independent judges showed that rejected Ss were most attractive, accepted Ss were next most attractive, and unknown Ss were least attractive. There was a positive relationship between physical attractiveness and dating for females, but not for males. A factor analysis of Ss' scores on personality inventories (e.g., the Jackson Personality Research Form) and subsequent analyses of variance of personality factors by sociometric groups showed that rejected Ss of both sexes were independent, achieving, and ambitious; accepted Ss were affiliative and affectionate; and isolated Ss were emotionally constricted, defensive, and withdrawn. (17 ref)—*Journal abstract.*

11612. Kriss, Mitchell; Indenbaum, Eugene & Tesch, Frederick. (Princeton U) **Message type and status of interactants as determinants of telephone helping behavior.** *Journal of Personality & Social Psychology*, 1974(Dec), Vol 30(6), 856-859.—Used the wrong telephone number technique to investigate the emotional tone or impact of the help-seeking message as a variable mediating the help seeker and potential benefactor interaction. Help seekers of high, low, or ambiguous status delivered 1 of 3 messages (positive appeal, negative appeal, or simple request) to 432 adult Ss of either high or low status. The frequency of the requested helping response was significantly affected by the message variations, but this effect was confounded by a significant Subject Status  $\times$  Help-Seeker Status  $\times$  Message Type interaction. Data also reveal that the message effect was limited to the ambiguous-status caller and opposite-status conditions.—*Journal abstract.*

11613. Kuehn, Lowell L. (U California, Riverside) **Looking down a gun barrel: Person perception and violent crime.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1159-1164.—Studied police reports of 100 crimes (2 homicides, 22 rapes, 15 assaults, and 61 robberies) in which the victim provided a description of the suspect who was unknown to him. Data show that the perception of a criminal assailant (as indicated by the completeness of description) is dependent on several variables related to characteristics of the crime and the victim. Taken from the perspective of person perception, these data suggest that perceiving and describing an object "in the field" may be influenced by a variety of conditions such as type of offense and the spatial and temporal characteristics of the act. Moreover, certain types of victims possessed differential capabilities for making identifications which might lead to an arrest.—*Journal abstract.*

11614. L'Armand, Kathleen & Pepitone, Albert. (Widener Coll) **Helping to reward another person: A cross-cultural analysis.** *Journal of Personality & Social Psychology*, 1975(Feb), Vol 31(2), 189-198.—Conducted a series of studies to confirm several motivational tendencies theoretically expected to determine how much an individual maximizes reward for another peer (other-rewarding as distinguished from other-relieving "altruism"), for himself, and for himself or another. Since these hypothesized motives (e.g., need for achievement, the norm of social responsibility, and the value of

equity) are likely to be affected by the larger cultural value system, a total of 172 male college students from widely different cultures—India and the US—were compared with respect to their disbursement of rewards to another and to self. Results indicate that American Ss rewarded another peer more than they rewarded themselves, while Indian Ss rewarded themselves more than they rewarded another peer. Such marked helping on the part of American Ss was limited to the case where nothing could be lost in doing so. When Ss could lose in proportion to how much the other gained, the altruistic tendency vanished, presumably because of the competitiveness engendered in such a zero-sum reward structure. The low level of helping by Indian Ss suggests a "quasi" competitiveness (since objectively nothing could be lost in rewarding another) engendered by a world view of limited resources. Questionnaire data confirm this conjecture by showing that the lower the income of the Ss' families, the lower the level of maximizing reward for another. Finally, non-Brahmin Ss rewarded a Brahmin peer less than did Brahmin Ss, supporting the view that quasi competitiveness is attenuated when the other is an ingroup member and/or the norm of social responsibility (operating at a comparatively low level in Indian Ss) is restricted to ingroup members. (17 ref)—*Journal abstract*.

11615. MacCorquodale, Donald W. (U South Florida, Medical School) **Sex differentials among family planning physicians in the Philippines.** *Health Services Reports*, 1973(Dec), Vol 88(10), 963-967.—Analyzed data collected from 200 Philippine family planning physicians. The 97 men were somewhat older than the 103 women, had more living children, and desired more children although there was no significant difference in marital status. The mean numbers of family planning acceptors recruited by men and by women were not significantly different. However, women physicians inserted a significantly higher proportion of intrauterine devices. More women than men cited tubal ligation as the contraceptive method they least preferred, and more men than women cited vasectomy as the least preferred method. Otherwise, no differences appeared between men and women physicians as to most and least preferred contraceptive methods, degree of concern about population growth, knowledge of contraception, or attitude toward contraception.—*R. S. Albin*.

11616. Miller, Gerald R. & McReynolds, Michael. (Michigan State U) **Male chauvinism and source competence: A research note.** *Speech Monographs*, 1973(Jun), Vol 40(2), 154-155.—Conducted a study with 69 male and 40 female undergraduates to test the hypothesis that if all other source qualifications and the message content are held constant, receivers will rate a male communicator as more competent than a female communicator. The predicted male chauvinistic effect was observed, and the effect was somewhat more pronounced for female receivers than for male receivers.—*Journal abstract*.

11617. Moriarty, Thomas. (New York U) **Crime, commitment, and the responsive bystander: Two field experiments.** *Journal of Personality & Social Psychology*, 1975(Feb), Vol 31(2), 370-376.—In 2 field experiments it was demonstrated that bystanders ( $N = 72$ ) more readily intervened to stop a theft if they had committed

themselves in advance to the victim. During the summer of 1972, thefts were staged (a portable radio taken from an unattended beach blanket) at Jones Beach, New York. Ss agreeing to watch the victim's belongings were more likely to notice the theft, and among those noticing, committed Ss were more likely to stop the theft. Similarly, thefts were staged at Automat cafeterias in New York City (a suitcase taken while the owner was absent). Again, committed Ss were more likely to stop the theft. Results support the notion that while conflict often prevents bystanders from intervening, prior commitment simplifies the decision process and produces a more responsive bystander.—*Journal abstract*.

11618. Moscovici, Serge & Nève, Patricia. (Ecole Pratique des Hautes Etudes, Paris, France) **Studies on polarization of judgments: III. Majorities, minorities and social judgments.** *European Journal of Social Psychology*, 1973, Vol 3(4), 479-484.—Studied the cognitive and interactional aspects of the shift from individual (preconsensus) to group (consensus) judgment of person perception and social judgment. Ss were 24 high school students in a private Catholic school who were given the Repertory Grid Test of 15 well-known personalities—scientists, political figures, actors, and artists. Each S was asked to select the most common of 3 personalities to the exclusion of a third. In the 2nd phase, group consensus was to be reached by the same procedure. Results show that polarization occurred after group interaction, and group criteria were less idiosyncratic and moralistic than individual judgments. In most group judgments the group adopted the pattern chosen by 2 or 3 individuals in the preconsensus phase, although a few individual judgments prevailed when there was no agreement in the preconsensus phase. It is concluded that decisions followed the common norm that emerged from the preconsensus phase.—*M. K. Phifer*.

11619. Payne, David E. (U Iowa) **Alienation: An organizational-societal comparison.** *Social Forces*, 1974(Dec), Vol 53(2), 274-282.—Studied the relation between comparable composite measures of powerlessness felt toward the work organization and toward society and a modified version of R. Blauner's occupational typology (1964) using data from 546 workers in 4 companies. Results show that (a) the degree of powerlessness workers felt in their work organization and in their society was not related to their type of work, and (b) there were no significant differences in the degree of powerlessness which workers felt in their work organization and in their society. (29 ref)—*Journal abstract*.

11620. Raben, Charles S.; Wood, Michael T.; Klimoski, Richard J. & Hakel, Milton D. (Ohio State U) **Social reinforcement: A review of the literature.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 186.

11621. Rim, Y. (Technion-Israel Inst of Technology, Haifa) **Perception of self and others in four situations.** *Interpersonal Development*, 1973-1974, Vol 4(3), 164-169.—Conducted a study to determine whether self-perception and perception of significant others would differ according to varied situations. Ss were 34 male and 46 female 6th-formers in Great Britain (mean age = 17 yrs). Ss were asked to rate themselves on 8 constructs (e.g., warm-cold) in 4 situations: (a) engaged in work, (b)

ty and subsequent social categorization, not attraction. (15 ref)—*Journal abstract*.

11628. Steele, Claude M. (U Washington) **Name-calling and compliance.** *Journal of Personality & Social Psychology*, 1975(Feb), Vol 31(2), 361-369.—Results of 2 experiments with a total of 221 housewives support the prediction that name-calling, by conveying a negative judgment, would enhance Ss' willingness to comply and their actual compliance with a later request for help. Negative names produced more compliance behavior than positive names. Also, whether or not the negative name was related to the help request made no difference in the percentage of Ss who agreed to comply. Exp II also demonstrated that it was the name's impugning of the S's general character and not its impugning of a specific behavior that was needed to increase later compliance. Implications for experiments using negative judgments as independent variable manipulations and for the relationship between self-esteem and consistency processes are discussed. (16 ref)—*Journal abstract*.

11629. Taylor, Stuart P. & Smith, Ian. (Kent State U) **Aggression as a function of sex of victim and male subject's attitude toward women.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1095-1098.—Investigated the relative aggressiveness of 40 undergraduate males who held either liberal or traditional beliefs concerning females as a function of provocation by male and female opponents. Both groups of male Ss reacted aggressively to provocation by male opponents and unaggressively to female opponents. The traditional male Ss were generally more aggressive to their opponents than the liberal male Ss.—*Journal abstract*.

11630. Tesser, Abraham & Conlee, Mary C. (U Georgia, Inst for Behavioral Research) **Some effects of time and thought on attitude polarization.** *Journal of Personality & Social Psychology*, 1975(Feb), Vol 31(2), 262-270.—Conducted 3 experiments with a total of 211 college students to examine the effects of thought on attitude change. It was predicted that (a) thought produces a change in attitude so as to make it more extreme in the initial direction (i.e., polarization); and (b) the longer one thinks about the attitude object, the greater the tendency toward polarization. In Exps I and II the attitude objects were drawn from a heterogeneous attitude questionnaire; in Exp III they were news-type photos. Hypothesis (b) was tested over the following thought durations: 30, 60, 90, and 180 sec in Exp I; 45, 60, 90, and 180 sec in Exp II; and 28 and 60 sec in Exp III. Exps II and III also had "no-thought" conditions, thereby permitting a test of Hypothesis (a). Using whether or not an attitude became more polarized as the dependent variable, Hypothesis (b) received significant support in all 3 experiments, and Hypothesis (a) was supported only in Exp III.—*Journal abstract*.

11631. Worthington, Mary E. (Pepperdine U) **Personal space as a function of the stigma effect.** *Environment & Behavior*, 1974(Sep), Vol 6(3), 289-294.—Tested whether the distance between S and E would increase if E had a highly visible stigma. Ss were males and females (other than highly gravid women, children below adolescence, and physically distressed persons), selected at random in an airport lobby. E hailed each S and asked for directions. 29 control Ss were contacted by a

"normal" E and 34 experimental Ss were contacted by an E simulating a physical disability. Distance of approach and time spent in the encounter were recorded. Distances were significantly greater in the experimental condition (mean = 19.5 in) than in the control condition (mean = 10.4 in). There was no difference in time spent in the encounter.—S. T. Margulis.

11632. Zanna, Mark P.; Goethals, George P. & Hill, Janice F. (Princeton U) **Evaluating a sex-related ability: Social comparison with similar others and standard setters.** *Journal of Experimental Social Psychology*, 1975(Jan), Vol 11(1), 86-93.—Tested L. Festinger's (1954) hypothesis that when people evaluate an ability they prefer to compare with others similar on characteristics related to performance vs the hypothesis that they prefer to compare with best-off others or standard setters. In a 2 × 2 design 30 male and 30 female undergraduates received ambiguous feedback about their performance on a test of an intellectual ability on which they believed either males or females excelled. Virtually all Ss first chose a same-sex reference group with which to compare and thus gave strong support to Festinger's similarity hypothesis. Ss in conditions where the opposite sex excelled switched more often to an opposite-sex reference group on their 2nd choice, indicating that comparing with standard setters is a secondary comparison priority. No sex differences were expected or found.—*Journal abstract*.

11633. Zillmann, Dolf; Mody, Bella & Cantor, Joanne R. (Indiana U, Inst for Communication Research, Radio-TV Ctr) **Empathetic perception of emotional displays in films as a function of hedonic and excitatory state prior to exposure.** *Journal of Research in Personality*, 1974(Dec), Vol 8(4), 335-349.—A film clip depicting a young couple in a dysphoric encounter was seen following 1 of 4 film segments that were selected and pretested with 16 female undergraduates to effect a factorial variation in (a) hedonic tone (positive, negative) and (b) excitatory potential (low, high). Reactions to the subsequent film were assessed via ratings to test predictions from excitation-transfer theory and to determine sequential effects in hedonically valued experiences. In Exp I with 42 female undergraduates, the subsequent film was viewed immediately after the antecedent film. A nearly significant distraction effect of excitation occurred; affective responses to the subsequent film were less intense following high-excitation films than following low-excitation films. In Exp II with 120 female undergraduates, the procedure employed in the interval between films was changed to foster close attention to the subsequent film. An excitation-transfer effect was observed, with the dysphoric encounter being perceived as sadder after high-excitation films than after low-excitation films. In both experiments, hedonic-set effects were also observed. (16 ref)—*Journal abstract*.

## COMMUNICATION AND LANGUAGE

11634. Alloni-Fainberg, Yafa. (Haifa School District, Israel) **Official Hebrew terms for parts of the car: A study of knowledge, usage and attitudes.** *International Journal of the Sociology of Language*, 1974, No 1, 67-94.

—Studied the acquisition and usage of Hebrew terms and attitudes toward the terms. Both demographic and place-of-learning predictors are considered.

11635. Baars, Bernard J. & Motley, Michael T. (U Wisconsin, Milwaukee) **Spoonerisms: Experimental elicitation of human speech errors.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 118.

11636. Bell, Wendell. (Yale U) **A conceptual analysis of equality and equity in evolutionary perspective.** *American Behavioral Scientist*, 1974(Sep-Oct), Vol 18(1), 8-35.—Examines definitions of equality and equity, and the evolutionary interpretations of the causes and effects of long-term changes in each. (48 ref)

11637. Berger, Arthur A. (California State U, San Francisco) **Drug advertising and the "pain, pill, pleasure" model.** *Journal of Drug Issues*, 1974(Sum), Vol 4(3), 208-212.—Describes the socialization impact of TV drug advertising on American drug abuse. A restructuring and redirecting of current advertising practices is advocated.

11638. Best, Roger J. (U Oregon) **An experiment in Delphi estimation in marketing decision making.** *Journal of Marketing Research*, 1974(Nov), Vol 11(4), 448-452.—Tested 4 hypotheses derived from the Delphi process (a method of anonymous estimation) to compare the accuracy of judgments made by self-rated experts and nonexperts when feedback precedes or follows estimates, and when written explanations are or are not required. Results demonstrate the importance of selectively separating experts from nonexperts on any given judgment task, and replicate the Delphi effect of convergence following feedback. (18 ref)

11639. Black, Stephen A. **Journeys into chaos: A psychoanalytic study of Whitman, his literary processes and his poems.** *Literature & Psychology*, 1974, Vol 24(2), 47-54.—Discusses some of Walt Whitman's poems in relationship to the depression and neurotic anxiety that plagued him for much of his life. These creative works are viewed as reactivating narcissism and internal conflicts, and the stages in his writing are matched with stages in his emotional development.

11640. Bode, Loreli. (U Nevada) **Communication of agent, object, and indirect object in signed and spoken languages.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1151-1158.—Used a picture-description task to study the comparative effectiveness of communication between 16 deaf, undergraduate, native users of American Sign Language, and 16 hearing undergraduates using spoken English. Within the 2 groups, paired Ss alternately described pictures to each other. Pictures illustrated 3 different characters assuming in turn the roles of agent, object, and indirect object. Following a description by S<sub>1</sub>, S<sub>2</sub> selected the picture he or she thought S<sub>1</sub> had described, from a set of 6 pictures containing the described picture. The frequency of errors did not differ significantly between signing and speaking Ss.—*Journal abstract*.

11641. Bonfield, E. H. (U Alabama) **Attitude, social influence, personal norm, and intention interactions as related to brand purchase behavior.** *Journal of Marketing Research*, 1974(Nov), Vol 11(4), 379-389.—Tested D. E. Dulany's 1968 theory of propositional control (originally concerned with verbal conditioning and concept learning) and its adaptation by M. Fishbein to include relationships between attitudes and behavior within a

marketing field setting. Purpose was to (a) extend the theory's usefulness for consumer brand purchase behavior and (b) examine the relative importance of attitude, social influence, personal norm, and intention among purchasers in general and among purchaser segments. Data from a questionnaire survey of 261 consumers who had previously purchased the product class (soft drinks) indicate that the importance of social psychological influences on consumer behavior varies according to the situation. The hypothesis that influences of attitude, social influence, personal norm, and intention are situation-bound was strongly supported. Evidence also suggests that consumer brand choice is a stochastic process. The usefulness of the Dulany-Fishbein theories and their resultant methodologies is also discussed. (33 ref)—*L. Gorsey*.

11642. Braren, Warren. (Consumer's Union, Mount Vernon, NY) **Deception in advertising and the failure of self-regulation.** *Journal of Drug Issues*, 1974(Sum), Vol 4(3), 213-216.—Describes the impact of deceptive advertising for over-the-counter drugs on the unnecessary expansion of the market for health products and on the promotion of insignificant product differences. Industry self-regulation attempts are considered inadequate.

11643. Brenner, Sten-Olof & Hjelmquist, Erland. **Psycholinguistics: Foundations and research approaches. I: From de Saussure (1916) to Chomsky (1957).** *Göteborg Psychological Reports*, 1974, Vol 4(3), 21 p.—Presents a critical review of psycholinguistic research and research foundations, including research based on N. Chomsky's 1957 theory. The Whorfian hypothesis is discussed in view of recent proposals from psycholinguistic researchers. The influence that linguistic theories have had on research approaches is traced and criticized, and suggestions are made as to what should most interest psychologists studying the production and understanding of speech. An outline of the development of linguistic theory is also presented, with emphasis on the works of F. Saussure (1916), L. Hjelmslev (1943), and N. Chomsky (1957). It is concluded that linguistic theory has led psychologists to concentrate on highly artificial situations that bear little resemblance to everyday communication. When using more natural situations, psycholinguistics gets results that cannot be accounted for by a linguistic approach based on theories such as that of Chomsky. (3½ p ref)—*Journal abstract*.

11644. Brink, A. W. (McMaster U, Hamilton, Ontario, Canada) **Hermann Hesse and the Oedipal quest.** *Literature & Psychology*, 1974, Vol 24(2), 66-79.—Discusses the effect of psychoanalysis on 20th century fiction and especially on the writings of Herman Hesse. Hesse is presented as a seeker after truth, as a pacifist, and as a writer who penetrated the modern obsession with survival of individual egos in an ever expanding and disorienting society. It is noted that Hesse is often misinterpreted to be encouraging escapism, but that he actually followed as far as possible the most valuable precept of psychoanalysis that unconscious material shall become conscious. Thus, the neurotic's greatest benefit in culture is to expose unconscious contents in order to reintegrate them in the ego so that all may see how it is managed. Art is seen as the most agreeable way

to communicate this process. All of Hesse's major works are discussed.—*R. S. Albin.*

11645. Carringer, Dennis C. (Winchester Public School System, Winsted, CT) **Creative thinking abilities of Mexican youth: The relationship of bilingualism.** *Journal of Cross-Cultural Psychology*, 1974(Dec), Vol 5(4), 492-504.—Examined the relationship of bilingualism to the creative thinking abilities of Mexican youth by administering 4 subtests from the Torrance Tests of Creative Thinking to 12 Spanish-English coordinate bilingual and 12 Spanish monolingual high school Ss. It was hypothesized that the Spanish-English coordinate bilinguals would score significantly higher on the dependent measures of figural fluency, figural flexibility, figural originality, verbal fluency, verbal flexibility, and verbal originality than the Spanish monolinguals. A multivariate analysis indicates that the main effect of language group was significant in favor of the bilinguals. Neither the main effect of sex nor the interaction effect was significant. Univariate analysis indicates that the dependent measures of verbal flexibility, verbal originality, and figural originality were significant at the .05 level in favor of the bilinguals, and the dependent measure of figural fluency was significant at the .01 level in favor of the bilinguals. (22 ref)—*Journal abstract.*

11646. Choynowski, Mieczyslaw. **A proposal for a new type of information about psychological measures.** *Educational & Psychological Interactions*, 1974(Nov), No 49, 13 p.—Argues that, in spite of the existence of many sources of information, the task of getting an exhaustive list of available psychological test instruments for some definite purpose is formidable. Ideas are presented for an improved information system in the form of a periodical publication to be called the *Test Compendium*. 3 main elements of this system are (a) the type of publication and its format, (b) a test description scheme, and (c) a test classification scheme. (35 ref)—*Journal abstract.*

11647. Claxton, John D.; Fry, Joseph N. & Portis, Bernard. (U British Columbia, Vancouver, Canada) **A taxonomy of prepurchase information gathering patterns.** *Journal of Consumer Research*, 1974(Dec), Vol 1(3), 35-42.—Used numerical taxonomic analysis to classify furniture and appliance buyers in terms of their prepurchase search behavior. Data were obtained from personal interviews with 546 Canadian housewives; questions concerned 5 aspects of prepurchase shopping activities—type and range of alternatives considered, information sources used, features considered, stores visited, and time spent considering the purchase. 3 measures were found to generate clusters which were both distinctive and comparable across sample split halves—number of information sources, total visits to stores, and deliberation time. 3 general clusters were identified in both the furniture and appliance buyer samples and were labeled as thorough (store intense), thorough (balanced), and nonthorough on the basis of group average measures on the discriminating variables. Results suggest that for a particular amount of deliberation, there may be trade-offs in the balance of attention given to different aspects of the purchasing process, and that in a particular search period, buyers may gather substantially different amounts of information. (16 ref)—*L. Gorsey.*

11648. Conville, Richard L. (U Massachusetts, Amherst) **Linguistic nonimmediacy and communicators' anxiety.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1107-1114.—Linguistic nonimmediacy refers to the degree of verbal indirectness with which a person refers to himself or to that about which he communicates. Current research on linguistic nonimmediacy indicates that this indirectness of verbal reference increases as the speaker experiences increased negative affect. 24 undergraduates were used in the present study to test the reliability of this finding in a nonlaboratory setting and using a within-Ss design. Results of previous research were replicated, and the argument is advanced that nonimmediacy analysis of Ss' language can be a legitimate substitute for conventional paper-and-pencil attitude tests. (19 ref)—*Journal abstract.*

11649. Cox, Eli P.; Anderson, W. Thomas & Fulcher, David G. (U Texas, Austin) **Reappraising mail survey response rates.** *Journal of Marketing Research*, 1974(Nov), Vol 11(4), 413-417.—Examined (a) the main and interaction effects among personalized cover letters, follow-up postcard reminders, and mail questionnaire response rate; and (b) the question of response reliability under limitations of budget, time, and sample size. Results show that personalized letters had significant positive effects on response rate, while follow-up reminders did not, regardless of personalized/nonpersonalized cover letters, and emphasize the importance of examining cost considerations in designing a mail survey.—*L. Gorsey.*

11650. Darden, William R. & Flaschner, Alan B. (U Georgia) **Visual presentation of marketing stimuli defined in hyperspace.** *Journal of Marketing Research*, 1974(Nov), Vol 11(4), 456-461.—Describes MULDI-PLOT, a method of visually analyzing and grouping, in hyperspace, data derived from multidimensional scaling and cluster analysis. The approach, in which points are depicted as lines, allows the proximity of multivariate points to be examined visually on a single plot, and in addition, subspaces, containing critical dimensions of differences among stimuli defined in hyperspace, can be isolated from the original space. (25 ref)

11651. Derks, Peter L. & Johnston, Becky. (Coll of William & Mary) **Effect of translation and transformation on recognition of sentences.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1269-1270.—Studied 16 English speakers who had lived in France and spoken French for at least 1 semester to examine the interaction between the recognition of transformed and translated sentences. No interaction appeared when the task included English-active sentences.

11652. Duncan, Starkey. (U Chicago) **On the structure of speaker-auditor interaction during speaking turns.** *Language in Society*, 1974(Oct), Vol 3(2), 161-180.—Studied the structure of speaker-auditor interaction during speaking turns, using detailed transcriptions of language, paralanguage, and body-motion behaviors displayed by both participants in dyadic, face-to-face conversations. On the basis of certain observed regularities in these behaviors, 3 signals were hypothesized: (a) a speaker within-turn signal, (b) an auditor back-channel signal, and (c) a speaker continuation signal. These signals were composed of various behaviors in language

and in body motion. It is suggested that the display of appropriate ordered sequences of these signals by both participants served to mark "units of interaction" during speaking turns. Results suggest the possibility of extending the analytic approach to language to the development of information about communication behavior in general.—*Journal abstract.*

11653. Evanechko, P. O.; Armstrong, R. D. & McFetridge, Patricia A. **Semantic space and the development of word meaning.** *Alberta Journal of Educational Research*, 1974(Dec), Vol 20(4), 305-315.

—Argues that from cumulative experiences which focus attention on the many ways in which words can have meaning, and on the many logico-semantic relations between words and their significates, each person builds a unique multidimensional meaning space. New words are processed in terms of the dimensions existing in the individual's meaning space. Development of verbal ability, therefore, should involve learning of ways of knowing concepts rather than learning words as undifferentiated entities, and these semantic associations should be organized into broader strategies of perceiving meaning to reduce the information processing load.—*Journal abstract.*

11654. Gordon, Andrew. (U California, Berkeley) **Why are we in Vietnam? Deep in the bowels of Texas.** *Literature & Psychology*, 1974, Vol 24(2), 55-65.—Presents a psychoanalytic review of Norman Mailer's books: *Why are we in Vietnam?*, *An American Dream*, and *Armies of the Night*. Mailer's obsession with disembowelment is viewed in terms of his concern with being attacked internally. The author's appeal is seen to be in his constant war with all his unmastered contradictions and fears.

11655. Higbee, Kenneth L. (Brigham Young U) **What is the "fear" in a fear-arousing appeal?** *Psychological Reports*, 1974(Dec), Vol 35(3), 1161-1162.—Obtained responses of 60 junior high and 126 undergraduates on 5 communications on the dangers of marihuana on 5 measures—fear, anxiety, nausea, worry, and concern. Correlations among measures were significant, but fear, anxiety, nausea, and worry showed high intercorrelations, while concern showed lower correlations with the other measures.

11656. Jefferson, Gail. (U Pennsylvania, Ctr for Urban Ethnography) **Error correction as an interactional resource.** *Language in Society*, 1974(Oct), Vol 3(2), 181-199.—Considers some small errors which occur in 181-199.—Considers some small errors of competence, natural talk, treating them as matters of competence, and both in the production of coherent speech and the conduct of meaningful interaction. Focusing on a rule-governed occurrence of the interjection "uh," a format is described by which one can display that one is correcting an error one almost, but did not, produce. 2 broad classes of error are considered, both of which can be announced by and extracted from the occurrence of an error correction format. These are "production" errors (i.e., a range of troubles one encounters in the attempt to produce coherent, grammatically correct speech) and "interactional" errors (i.e., mistakes one might make in the attempt to speak appropriately to some co-participant(s) and/or within some situation). It is proposed that the error correction format can be used to invoke

alternatives to some current formulation of self and other(s), situation and relationship, and thereby serve as a resource for negotiating and perhaps reformulating a current set of identities.—*Journal abstract.*

11657. Kaniuga, Nancy; Scott, Thomas & Gade, Eldon. (Lenawee County Probate Court, Adrian, MI) **Working women portrayed on evening television programs.** *Vocational Guidance Quarterly*, 1974(Dec), Vol 23(2), 134-137.—Analyzed the portrayal of work roles on evening TV programs, directing particular attention to the characterization of women. The occupational roles of 140 principal characters from 44 programs on 3 major networks were classified by means of the *Dictionary of Occupational Titles* and US Census Bureau categories. Results show that (a) women make up a smaller proportion of the work force on TV (21.4%) than in real life (37.8%); (b) far fewer working women on TV are married (10%) than in real life (60%); (c) TV overrepresents the proportion of women employed in professional, managerial, and technical categories (53% as opposed to 19.5%); (d) women workers on TV perform largely sex-stereotyped traditional roles; (e) high drama in existing work is usually reserved for TV males; (f) married woman's place on TV is at home. It is suggested that counselors aiding female clients in reality testing and career exploration beyond present boundaries must recognize the inaccuracies of TV portrayals.—C. A. Heikkinen.

11658. Kanter, Donald L. (U Southern California, School of Business Administration) **Research on the effects of over-the-counter drug advertising.** *Journal of Drug Issues*, 1974(Sum), Vol 4(3), 223-226.—Presents the findings of a systematic study of the effect of commercial advertising on drug usage. Advertising is not reported to directly lead to drug abuse, but is considered one of several factors in the social-media environment having a significant influence on an individual's behavior.

11659. Katz, Gary M. & Brophy, Alfred L. (Virginia Polytechnic Inst & State U) **Institutional sources of articles in the Journal of Counseling Psychology, 1962-1973.** *Journal of Counseling Psychology*, 1975(Mar), Vol 22(2), 160-163.—Surveys and tabulates institutional affiliations of authors of articles published in Vol 9-20 of the *Journal of Counseling Psychology*. Trends are reported within this 12-yr period, and comparisons are made with earlier surveys.

11660. Kiesler, Charles A.; Pallak, Michael S. & Archer, Richard. (U Kansas) **Commitment of audience, and legitimacy and attitudinal stance of communicator: A test of the "woodwork" hypothesis.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1035-1048.—Based upon an analysis of anecdotal evidence in social reality, an experiment was conducted with 135 undergraduates in which the following were varied: one's prior commitment to consonant behavior, and the legitimacy and attitudinal stance (agree-disagree) of a communicator. Legitimacy of a communicator was defined as independent of his prestige, sincerity, and personal attractiveness, and limited to his qualifications to speak on a specific issue. A variety of measures were taken to define Ss' perceptions of legitimate and illegitimate communicators. Legitimacy tended not to affect uncommitted Ss. Committed Ss responded positively to the legitimate

communicator and negatively ("boomerang") to the illegitimate speaker regarding attitude change, behavior measures, and information-seeking, regardless of the attitudinal stance of the communicator.—*Journal abstract*.

11661. Kornbluth, Ilana & Aynor, Sarah. (Hebrew U, Jerusalem, Israel) **A study of the longevity of Hebrew slang.** *International Journal of the Sociology of Language*, 1974, No 1, 15-37.—Examines factors including the language of origin, category of content, structural characteristics, and selected individual background characteristics of slang users.

11662. Lackner, James R. & Levine, Kenneth B. (Brandeis U) **Speech production: Evidence for syntactically and phonologically determined units.** *Perception & Psychophysics*, 1975(Jan), Vol 17(1), 107-113.—The durational accuracy with which 8 normal university students could speak syntactically structured strings of words was compared with their accuracy in speaking word lists. These measurements underscored the great temporal precision of the human articulatory mechanism which appears to be the most precisely controlled movement system of the human body. Evidence is presented that when a syntactically structured message is being spoken, the centrally programed innervational units involved in its articulatory implementation are greater in size and complexity than when a word list is being spoken. (21 ref)—*Journal abstract*.

11663. Langendoen, D. Terence; Kalish-Landon, Nancy & Dore, John. (City U New York) **Dative questions: A study in the relation of acceptability to grammaticality of an English sentence type.** *Cognition*, 1973, Vol 2(4), 451-478.—Notes that generative grammarians have contended that English sentences of the type Who(m) did you give the book? (what are here called "dative questions") are ungrammatical. The incorporation of the necessary restrictions in the grammar of English to account for this, however, requires a weakening of linguistic theory. It would be desirable, therefore, to account for the restriction within performance theory, as has been proposed by R. Jackendoff and P. Culicover (1971). It is shown that their particular account is inadequate. It was found that in the course of trying to devise a better account, by 2 different questionnaire-type experiments using a total of 48 undergraduates and professional persons in Exp I and 79 undergraduates in Exp II, that some English speakers, all from metropolitan New York City, accept dative questions. On the basis of this finding, it is theorized that the observed variation in acceptability of dative questions is best accounted for by differences in the perceptual strategies for determining the grammatical relations in perceived clauses that different populations of English listeners use. There are thus no dialect differences, strictly speaking, for dative questions; they are all grammatical for all English speakers. (French summary) (19 ref)—*Journal abstract*.

11664. Levelt, W. J. **Formal grammars in linguistics and psycholinguistics: III. Psycholinguistic applications.** The Hague, Netherlands: Mouton, 1974. viii, 206 p.—Presents a 4-chapter discussion which demonstrates how the theory of formal languages and its applications to linguistics have penetrated psycholinguistics. Key chapter topics are: Grammars in Psychology of Lan-

guage, Grammars and Linguistic Intuitions, Grammars in Models of the Language User, and Grammars and Language Acquisition. (12 p ref)

11665. McEwen, William J. & Hanneman, Gerhard. (U Connecticut) **The depiction of drug use in television programming.** *Journal of Drug Education*, 1974(Fal), Vol 4(3), 281-294.—Suggests that complete evaluation of antidrug abuse campaigns should examine not only the messages created, but the programming content which makes up the information environment for those receiving the messages. A content analysis of commercial messages, public service announcements, and TV programs shown during prime time indicates that far more messages propose an increase in the use of specified drugs (all licit) than warn of the possible dangers of the abuse of illicit or licit drugs. The most frequently depicted drug on TV is alcohol, generally in a positive context. It is concluded that commercial appeals promoting chemical agent use and programming which largely neglects abuse potentials suggest cautions for the strategy planner and questions for media programmers.—*Journal abstract*.

11666. Monaco, Paul. **The popular cinema as reflection of the group process in France, 1919-1929.** *History of Childhood Quarterly: The Journal of Psychohistory*, 1974(Spring), Vol 1(4), 607-636.—Suggests that persistent themes in popular cinema may be used as a major index of mass fantasy, and demonstrates the significance of some central themes in French cinema during the 1920s to political conditions of the time. Latent collective meanings of films reveal themselves through analysis of manifest film contents. 48 native film productions achieved widespread popularity in France from 1919 to 1929. Collective obsessions (e.g., concern with children and birth, an unconscious group wish reflected in orphan films, and elements of war, violence, and danger) are analyzed in film and in French society.—*J. Carlson*.

11667. Mortensen, C. David & Arntson, Paul H. (U Wisconsin, Madison) **The effect of predispositions toward verbal behavior on interaction patterns in dyads.** *Quarterly Journal of Speech*, 1974(Dec), Vol 60(4), 421-430.—Selected 3 groups of 24 Ss each, significantly different in amount of verbal activity, from 350 Ss who took a 25-item self-report test of Predispositions toward Verbal Behavior (PVB). The hypothesis was formulated and verified that a significant linear trend among levels of intensity would occur on duration of time spent in answering interviewers' questions, the number of words used in answering the questions, the Ss' impressions of their own verbal activity, and interviewer understanding of what the Ss had said. Statistical strategies employed included a  $2 \times 3 \times 2$  split-plot factorial design with an alpha set at .025 for all measures, a  $3 \times 2$  randomized factorial design with an alpha set at .025 for each measure, Scheffe's post-hoc analysis, Omega<sup>2</sup>, and the Grieser-Greenhouse Conservative F value to measure the significance of the interaction of Trials  $\times$  Order. The PVB has consequences that are both stable over time and consistent in a given social setting, and it has implications for efforts to formulate models of communication based upon the interplay between self- and other-directed perceptions of communication.—*H. Ruja*.

11668. **Mulac, Anthony; Hanley, Theodore D. & Prigge, Diane Y.** (U California, Lab for Quantitative Research in Speech, Santa Barbara) **Effects of phonological speech foreignness upon three dimensions of attitude of selected American listeners.** *Quarterly Journal of Speech*, 1974(Dec), Vol 60(4), 411-420.—26 foreign-born and 6 American-born university graduate students recorded impromptu English monologues on audiotape. From these monologues, 16 45-sec samples were selected as most "representative" and presented to 52 middle-aged, middle-class townspeople of both sexes and to 40 university students of both sexes. Ss rated the samples on 22 items of a Speech Dialect Attitudinal Scale (SDAS). Factor analysis identified 3 dimensions of the ratings: Socio-intellectual Status, Esthetic Quality, and Dynamism. Reliability of the data from the SDAS was consistently high, and its construct validity was indicated by the consistency of factor structure across rater groups. Native-born speakers were rated higher than the foreign-born on all 3 dimensions. It is concluded that attitudinal judgments towards speakers are influenced by perceived voice quality. (26 ref)—*H. Ruja*.
11669. **Nakanishi, Masao & Bettman, James R.** (U California, Graduate School of Management, Los Angeles) **Attitude models revisited: An individual level analysis.** *Journal of Consumer Research*, 1974(Dec), Vol 1(3), 16-21.—Examined models of attitude structure and of attribute importance using regressions for each individual S for data on toothpaste brands. 121 graduate and undergraduate students completed semantic differential scales, with 5 adjective pairs for attitudes toward the act of buying each brand and the evaluative aspects of a given attribute, and 5 pairs for beliefs and the importance of the attribute. Results show that beliefs-only and standard Evaluation  $\times$  Belief models are virtually indistinguishable and that importance has different meanings for different Ss. The inclusion of attributes beyond the most important did not significantly improve predictions. The low-involvement nature of the product class may have influenced the data, however. 3 methodological requirements for future research in multiple-attribute models are outlined. (20 ref)—*L. Gorsey*.
11670. **Peltz, Fillmore K.** (Fiorello H. LaGuardia Community Coll, Middle Coll, City U New York) **The effect upon comprehension of repatterning based on students' writing patterns.** *Reading Research Quarterly*, 1973-1974, Vol 9(4), 603-621.—Investigated whether using repatterning passages affected reading comprehension. 34 10th-grade Ss wrote 1,000 prose words dealing with social studies content. 8 passages were repatterned to approximate the syntactic patterns found in transformational analysis of the Ss' writing using T units and a linguistic analysis worksheet. No significant differences in multiple choice test scores resulted from repatterning, but cloze items based upon repatterned passages showed significantly more correct responses ( $p < .05$ ). It is concluded that syntactic patterns generated by learners are different from those generated by authors. Moreover, comprehension as measured by multiple choice tests may be different from comprehension as measured by the cloze procedure. (French & Spanish summaries) (26 ref)—*E. J. Mason*.
11671. **Ryans, Adrian B.** (U Western Ontario, London, Canada) **Estimating consumer preferences for a new durable brand in an established product class.** *Journal of Marketing Research*, 1974(Nov), Vol 11(4), 434-443.—Describes a theoretical model for estimating demand for a durable brand at a given price in an established product class. The model assumes that a consumer making a durable purchase selects the brand that will maximize his total satisfaction while meeting his budget constraints. 4 groups of 188 Ss (1 analysis and 3 validation groups) were used to test the model, with electric blenders used as the product class. Ss were told to assume (a) that they had won money greater than the price of any of the brands, (b) that they had to purchase a brand, and (c) that they could retain any change from the transaction. Results support the predictive utility of the model in a laboratory setting. Suggestions for its use in field studies and some recommended modifications are presented. (17 ref)—*L. Gorsey*.
11672. **Schumacher, Sanford P.; Swezey, Robert W.; Pearlstein, Richard B. & Valverde, Horace H.** (Applied Science Assoc, Valencia, PA) **Guidelines for abstracting technical literature on instructional system development.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 113-114.
11673. **Seckbach, Fern.** (Ctr for Educational Research, Jerusalem, Israel) **Attitudes and opinions of Israeli teachers and students about aspects of modern Hebrew.** *International Journal of the Sociology of Language*, 1974, No 1, 105-124.—Examined attitudes toward the effective usage of modern Hebrew by journalists, authors, and intra-Israel ethnic groups.
11674. **Seidenberg, Robert.** (State U New York, Upstate Medical Ctr, Syracuse) **Images of health, illness and women in drug advertising.** *Journal of Drug Issues*, 1974(Sum), Vol 4(3), 264-267.—Reviews the use of derogatory and demeaning images of women in physician-directed drug advertising, and considers the harmful aspects of the use of prescribed psychoactive drugs for children.
11675. **Silberelsen, Rainer K.** (Technische U Berlin, Inst für Psychologie, W Germany) **[Investigations of the effect of frequency limitations on the expressive content of diction.]** (Germ) *Zeitschrift für Experimentelle und Angewandte Psychologie*, 1974, Vol 21(4), 637-661.—Used different band filters to limit the frequency range of taped spoken samples collected from 9 students. 33 student Ss judged 99 of the tapes on 10 dimensions—pleasant-unpleasant, fresh-dull, etc. Factor analyses of the results indicated that the frequency restrictions not only failed to diminish the expressive quality of the undistorted voice but sometimes strengthened it. The importance of these findings for electronic synthesis of diction is discussed. (English & French summaries) (43 ref)—*W. J. Kopitz*.
11676. **Smith, Charles B.** (Arizona State U, Coll of Business Administration) **Communication: An essential of reality.** *Personnel Journal*, 1974(Aug), Vol 53(8), 601-605, 625.—Describes communication as a process of exchanging meanings. 3 principles of communications are discussed: (a) What we don't clearly understand, we

can't communicate. (b) Words are both barriers and carriers of meaning. (c) We communicate as we perceive reality.

11677. Stanton, John L. & Lowenhar, Jeffrey A. (Temple U) **A congruence model of brand preference: A theoretical and empirical study.** *Journal of Marketing Research*, 1974(Nov), Vol 11(4), 427-433.—Presents an individual need-based distance model to explain and predict brand preference. The model is based on the hypothetical symmetry between a consumer's needs and his perception of alternative brands' ability to satisfy those needs: the more a product is perceived as having the ability to satisfy an individual's needs (i.e., the press of the product), the more it will be preferred over similar alternatives. 53 undergraduates were used to predict preference for 6 brands of cars using this need-press model. G. Stern's Activity Index was used to measure both need and press components. Findings suggest that the distance model may be more productive than certain expectancy value models, and demonstrate the model's ability to reproduce the original orderings of the Ss. The usefulness of the model for studying multidimensional motivational levels of consumer behavior is discussed in terms of both individual motives and environmental factors.—L. Gorsey.

11678. Sternthal, Brian & Craig, C. Samuel. (Northwestern U, Graduate School of Management) **Fear appeal: Revisited and revised.** *Journal of Consumer Research*, 1974(Dec), Vol 1(3), 22-34.—Presents a review and analysis of fear appeals, examines their effects on consumer behaviors, and discusses methodological considerations in fear research. 2 basic approaches to fear research are identified—one which involves the presentation of a persuasive message that specifies a dangerous practice and its consequences (e.g., smoking), and the other which elaborates the results of failure to perform certain activities (e.g., dental hygiene). Dependent measures in fear experiments are also described (e.g., behavioral compliance), and it is noted that unlike most attitudinal studies, fear research involves the assessment of Ss' responses on variables other than attitude change or persuasion. Findings on the effect of fear on persuasion, intention, and behavior indicate that fear arousal has greater effects on attitude change than on subsequent intentions or behaviors. Fear drive and parallel response paradigms of the effects of fear arousal, and several moderators of fear (e.g., communicator credibility and audience characteristics) are examined, along with types of fear and contextual effects of fear. (2½ p ref)—L. Gorsey.

11679. Stewig, John W. (U Wisconsin, Milwaukee) **Children's picture preferences.** *Journal of Instructional Psychology*, 1974(Fal), Vol 1(4), 2-8.—Conducted a study to learn what types of illustrations children prefer in the books they look at or read. Ss were 1,078 black and white children of both sexes from lower, middle, and upper social classes. They ranged in grade level from prekindergarten to 6th grade. Ss viewed slides designed to elicit preferences on 5 elements: color, shape, proportion, detail, and space. No overall significant differences were found. Significant interactions were found (a) between grade level and color, detail and space choices; (b) between social class and detail and space

choices; and (c) between racial groups and color detail, space and shape choices. Results indicate that children do prefer different types of pictures; choices are related to factors investigated. Implications are drawn for those who create and choose book illustrations for children.—*Journal abstract.*

11680. Strong, Edward C. (Tulane U) **The use of field experimental observations in estimating advertising recall.** *Journal of Marketing Research*, 1974(Nov), Vol 11(4), 369-378.—Presents a model of advertising recall within an audience that provides the basis for a schedule simulator which estimates advertising recall for a variety of schedules (e.g. weekly, monthly, or bimonthly). The outcomes of the simulations are compared with previous research.

11681. Summers, John O. (Indiana U) **Less information is better?** *Journal of Marketing Research*, 1974(Nov), Vol 11(4), 467-468.—Argues that the conclusions of the article by J. Jacoby et al (see PA, Vol 53:1138) on the effects of information load on consumer purchases do not accurately follow from their data, and that their procedures for constructing the experimental conditions and their method of evaluating the quality of Ss' decisions are questionable. The exploratory nature of the Jacoby article is emphasized.

11682. Szalay, Lorand B. & Bryson, Jean A. (American Inst for Research, Washington, DC) **Psychological meaning: Comparative analyses and theoretical implications.** *Journal of Personality & Social Psychology*, 1974(Dec), Vol 30(6), 860-870.—Compared 6 major methods of empirical semantic analysis, including semantic differential, similarity judgment, and association tasks, to explore their relationship, the range of their differences, and their implications for the conceptualization of psychological meaning. 5 of the 6 measures produced high positive intercorrelations, while the standard semantic differential correlated only with attitude measures. However, a modified semantic differential containing more relevant scales—scales adapted to the words in the investigations—did produce high positive correlations with the other meaning measures. Thus, past differences between the semantic differential and similarity judgment as well as association tasks appear as consequences of the frequent irrelevance of the semantic differential scales adapted by universalist strategies. (29 ref)—*Journal abstract.*

11683. Tybout, Alice M. & Zaltman, Gerald. (Northwestern U) **Ethics in marketing research: Their practical relevance.** *Journal of Marketing Research*, 1974(Nov), Vol 11(4), 357-368.—Considers that an understanding of ethical issues in marketing research may contribute to the quality of research data. The rights of Ss in marketing studies are examined and compared to the rights of consumers (e.g., the right to be heard, the right to safety, and the right to choose). A tabular presentation of Ss' rights, possible results of violating these rights, and their effects on research methodologies and results is discussed in detail. It is concluded that when Ss' rights are violated, not only do Ss lose the opportunity to communicate clearly, but the data gathered may be inaccurate and lead to false conclusions by researchers and clients. (52 ref)—L. Gorsey.

11684. Wilkie, William L. (U Florida) **Analysis of effects of information load.** *Journal of Marketing Research*, 1974(Nov), Vol 11(4), 462-466.—Questions the assumptions of the article by J. Jacoby et al (see PA, Vol 53:1138) which concluded that dysfunctional effects on brand choice result from more information. Methodological problems are examined, and Jacoby's definition of product information variables as number of brands rather than number of items/brand is questioned.

11685. Witt, Robert E. & Fulcher, David G. (U Texas, Austin) **Effect of alternative combinations of predictor variables in behavioral research.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1287-1290.—Examined alternative methods of combination of predictor variables to evaluate the impact of various combinatorial methods in behavioral research, using as the dependent variable consumers' information-seeking about purchases. The 4 predictor variables were perceived conspicuousness of the product, perceived risk in a decision to purchase, need for social approval, and compliance. Data were collected from 89 housewives via personal interviews in Ss' homes. 3 combinations of predictor variables were examined using multiple correlation analysis. The 3 models differed substantially in terms of percentage of explained variation.—*Journal abstract.*

## PERSONALITY

11686. Abbott, Robert D. (California State U, Fullerton) **Social desirability and judged frequency of occurrence: Reanalysis and comment on Bernhardtson and Fisher.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1271-1274.—Re-examined the conclusions of C. Bernhardtson and R. Fisher (see PA, Vol 46:6785) on the "direct contribution" of the social desirability scale value and judged probability of occurrence in the population to the prediction of the proportion of respondents answering "true" to personality items. Emphasis is placed on new estimates of "direct contribution" upon multiple regression model comparisons which emphasize the common "contribution" between the judged probability of occurrence and social desirability and are not influenced by the ordering of variables in the regression equation. (20 ref)—*Journal abstract.*

11687. Abend, Sander M. **Problems of identity: Theoretical and clinical applications.** *Psychoanalytic Quarterly*, 1974(Oct), Vol 43(4), 606-637.—Reviews the various meanings and usages of the term "identity," particularly among psychoanalytic writers such as E. H. Erickson, P. Greenacre, and E. Jacobson. 2 groups of meanings seem to be involved. The first includes such concepts as self, self-representation, self-image, and the sense of self. The second group refers to ego, personal identity, sense of identity, and sexual identity. Redefinitions and reformulations of these concepts are advanced.—J. Z. Elias.

11688. Becker, Stephen. (City Coll, City U New York) **Father absence and its relationship to creativity.** *Graduate Research in Education & Related Disciplines*, 1974(Spring), Vol 7(2), 32-52.—Attempted to determine whether children who experienced father absence during childhood are more creative than children whose

father was present. 60 undergraduates were randomly selected on the basis of their responses to a questionnaire regarding family structure and perception of parental influence. The Unusual Uses test, applied to tin cans, was given in group settings, and scored for fluency, flexibility, and originality. A significant  $F$  ratio ( $p > .01$ ) was obtained for all 3 factors of creativity. An additional significant finding was that whether the father had been absent or present, mother-influenced Ss were superior to father-influenced Ss on all 3 factors. (52 ref) —C. Tatham.

11689. Becker, W. Michael. (Brigham Young U) **Internal-external scale correlated with Edwards Personal Preference Schedule.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1182.—Studied 32 male and 57 female undergraduates in an extension of R. DiGiuseppe's (1971) hypothesis that there is a relationship between several Edwards Personal Preference Schedule scales and Rotter's Internal-External Control Scale. No support for the hypothesis was found.

11690. Bloomberg, Morton. (Western Connecticut State Coll) **On the relationship between internal-external control and morality.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1077-1078.—53 undergraduates varying in sophistication about moral judgment on the Defining Issues Test completed Rotter's Internal-External Control Scale. Analysis shows that internally oriented Ss used significantly more Stage-6 thinking than externals.

11691. Brenner, Charles. **On the nature and development of affects: A unified theory.** *Psychoanalytic Quarterly*, 1974(Oct), Vol 43(4), 532-556.—Advances a new psychoanalytic theory of affects. Affects are complex mental phenomena which include sensations of pleasure, displeasure (or both), and ideas. The development of affects and their differentiation from one another depend on ego and on later superego development. Further amplification of the theory within the general framework of psychoanalysis is presented.—J. Z. Elias.

11692. Bull, R. H. (North East London Polytechnic, England) **Personality and physiological recovery.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1086.—In a study of the reliability of several galvanic skin response (GSR) parameters, Ss' mean GSR recovery tended to remain constant over a number of months. Negative correlations were observed between mean GSR recovery quotients and anxiety and between recovery and neuroticism, even when Ss were not extreme scorers on the personality scales.

11693. Bush, David F. & Coward, Raymond T. (Villanova U) **Sex differences in the solution of achromatic and chromatic embedded figures.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1121-1122.—Of 20 male and 20 female undergraduates given 6 items of the Embedded Figures Test, female Ss proposed significantly more incorrect solutions and required significantly more time to reach correct solutions. There were no differences due to color format and no interactions.

11694. Callison, Connie P. (George Mason U) **Experimental induction of self-concept.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1235-1238.—Studied 28 3rd graders to investigate the effects of both positive and

negative feedback on children's self-concept. Group-1 Ss were administered Items 1-40 of the Piers-Harris Children's Self Concept Scale (CSCS) and a mathematics test. Ss were then administered Items 41-80 of the CSCS after being told that they had made high scores on the mathematics test. Group-2 Ss were administered the same tests but were told that their performance on the mathematics test was not adequate. Results show that Group-1 Ss' scores on the self-concept scale did not change while Group-2 Ss' scores decreased. It is suggested that discrepancies in the children's expected and reported performances on the mathematics test may have affected their subsequent self-concept ratings. —*Journal abstract.*

11695. Chaikin, Alan L.; Derlega, Valerian J.; Bayma, Benjamin & Shaw, Jacqueline. (Old Dominion U) **Neuroticism and disclosure reciprocity.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 13-19.—49 male undergraduates identified as either "normal" or "neurotic" by their scores on the Maudsley Personality Inventory were exposed to a confederate who disclosed either intimate or superficial information about himself, as part of an "impression formation" study. Normal males reciprocated disclosure at a level of intimacy similar to the confederates, but neurotics disclosed at a moderate level regardless of whether the confederate's initial disclosure was intimate or superficial. Results suggest that neuroticism may be related to inappropriate or nonnormative disclosure, rather than characteristically high or low levels of disclosure. (26 ref) —*Journal abstract.*

11696. Chun, Ki-Taek & Campbell, John B. (U Michigan, Inst for Social Research) **Dimensionality of the Rotter Interpersonal Trust Scale.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1059-1070.—Interspersed the Rotter Interpersonal Trust Scale in a larger questionnaire completed by 187 undergraduates. 4 dimensions—Political Cynicism, Interpersonal Exploitation, Societal Hypocrisy, and Reliable Role-performance—were identifiable across analysis techniques. (18 ref)

11697. Cohen, Ronald J. & Teevan, Richard C. (State U New York, Albany) **Fear of failure and impression management: An exploratory study.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1332.—Results of a study of 20 male undergraduates with either very high or very low scores on R. Birney et al's Hostile Press support the hypothesis that persons high on fear of failure are more likely to take advantage of an opportunity to manage a favorable impression which would enhance the individual's social value.

11698. Constantinople, Anne. (Vassar Coll) **Analytical ability and perceived similarity to parents.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1335-1345.—Previous research has indicated that analytical ability is a masculine characteristic in that males score higher than females on such measures and, within sex groups, those who are classified as more masculine on measures of sex-typing tend to have greater analytical ability. To examine the relationships found in earlier research, 40 male and 101 female undergraduates were studied, focusing on field independence as one aspect of analytical ability. Although some of the data confirm earlier findings, especially within sex groups, the most significant result is

that females were more field-independent than the males. It is pointed out that serious questions about both the measures used and the nature of the sample can be raised, making any generalization unwise, but the finding is unprecedented in published research. (18 ref)—*Journal abstract.*

11699. Dangaard, Collin. **Ten thousand hands.** *Psychic*, 1974,(Nov-Dec), Vol 6(1), 40-43.—Reports the findings of a Los Angeles engineer who has photographed and studied hands for more than 10 yrs. It is asserted that the palm "lines" of traditional palmistry mean nothing, but the size and shape of the hand correlate strongly with personality and character, and hence with choice of profession. The largest hands of all belong to people in mental institutions. Hand size is related to body height by a formula involving width of palm, length of palm, and length of fingers. Temperament is also indicated by the grain structure of the palm, i.e., the fine lines of the skin.

11700. Dietz-Helmers, A. **On correlation between the generation age of the fathers and grandfathers and the intelligence of the descendants.** *Experientia*, 1974, Vol 30(5), 567-570.—Conducted a series of correlational studies of the relationship between the age of the parents at the birth of the child and the intelligence of these children. 3 of the series involved highly gifted personalities while one included persons of below average endowment. Data were collected from biographies of outstanding persons—1,560 descendants—and from a study of isolated and below average individuals—380 descendants. In addition, a field investigation was carried out in Munich, Germany, on 87 boys: IQ tests and questionnaires were administered. Overall results support the hypothesis that generation age and IQ are related: intelligence, in this sense, was related to the age of the father and his parents at the time of the child's birth, but not to the ages of the mother and her parents. Correlations carried out to determine if these results were an artifact of social class or birth order were nonsignificant. Sources of error in this research are noted, and suggestions are made for further study. (German summary)—R. S. Albin.

11701. Edelstein, E. L. (Hadassah U Hosp & Medical School, Jerusalem, Israel) **Experience and mastery of pain.** *Israel Annals of Psychiatry & Related Disciplines*, 1974(Sep), Vol 12(3), 216-226.—Considers pain experience and its expression to be not only the results of the stimulus and its perceptive threshold, but also of many other correlates. A short summary of the psychological theories of pain is discussed. An attempt is made to relate the expressions reflecting pain experience as dependent on ethnocultural, developmental, and personal factors. Based on a review of previous studies, an attempt is made to demonstrate that various styles of mastery of pain in the local Israeli population are partly determined by their countries of origin and their belonging to groups. The various attitudes of doctors to the sufferer are discussed.—*Journal abstract.*

11702. Eysenck, Michael W. (U London, Birkbeck Coll, England) **Individual differences in speed of retrieval from semantic memory.** *Journal of Research in Personality*, 1974(Dec), Vol 8(4), 307-323.—Hypothesized that extraverts retrieve information from semantic

memory faster than introverts. A total of 109 undergraduates served as Ss in 2 experiments. In Exp I, the stimulus items consisted of category names followed by a single letter (e.g., fruit-P). Ss, half of whom were introverts and half extraverts (determined by the Eysenck Personality Inventory), responded as quickly as possible with a member of the specified category starting with the letter. Extraverts responded significantly faster than introverts, and more so when the most likely response was of low frequency than when it was of high frequency. In Exp II, Ss were assigned to 1 of 4 groups representing the 4 combinations of high and low extraversion and high and low general activation (determined by the Activation-Deactivation Adjective Check List). The speed-of-recall task from the 1st experiment was used on some trials; on the remaining trials, a speed-of-recognition task was used. Extraverts had greater response speed than introverts for recall, but not for recognition. (34 ref)—*Journal abstract*.

11703. Feinman, Saul & Rogers, James D. (U Wyoming) **Sex differences in psychological rigidity. *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1337-1338.**—Investigated sex differences on a battery of 3 scales of psychological rigidity in 112 male and 138 female college students. The size of the intercorrelations among the scales suggests that psychological rigidity is a multidimensional concept. Females were significantly less rigid on 2 of 3 scales. The experience by females of a wider range of approved behavior is suggested as a possible explanation.

11704. Freund, Kurt; Langevin, Ron; Laws, Richard & Serber, Michael. (U Toronto, Ontario, Canada) **Femininity and preferred partner age in homosexual and heterosexual males. *British Journal of Psychiatry*, 1974(Nov), Vol 125, 442-446.**—Conducted a study of 260 androphilics, 32 ephebophilics, and 24 homosexual pedophilics to investigate the relationship between "femininity" and male homosexuality, taking into consideration preferred partner age. Ss were given a sexual deviation questionnaire and the California Psychological Inventory. Results indicate that homosexual males in general scored higher on femininity than did heterosexuals, and that within the homosexual groups such males who erotically preferred physically mature partners scored higher on femininity than did those who erotically preferred pubescents or children. There was the unexpected finding that heterosexual pedophilic males scored higher on femininity than normals and could not be differentiated in this respect from the homosexual groups. (15 ref)—*Journal summary*.

11705. Gale, Raymond. (Ball State U) **Who are you? The psychology of being yourself.** Englewood Cliffs, NJ: Prentice-Hall, 1974. x, 177 p.—Posits that each person must assume responsibility for realizing the full potential of his humanity. Topics include the humanistic nature and humanistic and existential models of the person, the person as a perceiver and as a striver, validation of one's identity, meeting self-actualizing needs, and love as a creative personal risk. (4½ p ref)

11706. Garza-Guerrero, A. Cesar. (C. F. Menninger Memorial Hosp, Topeka, KS) **Culture shock: its mourning and the vicissitudes of identity. *Journal of the American Psychoanalytic Association*, 1974, Vol 22(2),**

408-429.—Describes culture shock as a polyphasic psychosocial phenomenon, a reactive process stemming from the effect of a new culture upon those who attempt to merge with it. Violent removal from an expectable environment and subsequent exposure to a relatively unpredictable, strange new environment, triggers the process. Mourning for the massive loss of loved objects—the abandoned culture—and the concomitant threats to the individual's identity constitute the common denominator in various types of culture shock. The adaptive functions of mourning are prerequisites for a successful solution of the shock problem. The stages of culture shock are described, from the initial mourning and identity threats to final transformations and reintegration of the newcomer's identity. (31 ref)—*Journal summary*.

11707. Gibson, H. B. & Curran, J. D. (Hatfield Polytechnic, England) **The effect of distraction on a psychomotor task studied with reference to personality. *Irish Journal of Psychology*, 1974(Win), Vol 2(3), 148-158.**—Studied 22 undergraduates to test the hypothesis that introverts' performance on a primary test of psychomotor efficiency would be more effectively disrupted than that of extroverts by a secondary task. A suitable cognitive task, to act as a distractor to performance on the Gibson Spiral Maze, was found by pilot study. This distractor was presented alternately on half of 8 successive maze-trials in the main investigation. Extraversion, as determined by the Eysenck Personality Inventory, was found to be significantly related to maze performance. Introverts tended to slow down on distracted trials but extraverts were often speeded up by distraction. Those effects are interpreted in terms of the S maintaining an efficient level of performance in accord with temperamental reaction tendencies. (19 ref)—*Journal abstract*.

11708. Goldberg, Barbara & Folkins, Carlyle. (U Houston) **Relationship of body-image to negative emotional attitudes. *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1053-1054.**—Correlations of mean body image and Multiple Affect Adjective Checklist scores for male and female undergraduates yielded ratings not statistically significantly different, although ratings for females varied more than those for males.

11709. Golden, Charles J. (U Hawaii, Manoa) **Sex differences in performance on the Stroop Color and Word Test. *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1067-1070.**—Notes that despite the wide use of the Stroop Color-Word Test in psychological research, there has been relatively little work on the effect on the test of demographic variables. The present study examined the effect of sex on pure scores of interference and the general effects of 219 undergraduates' sex on Stroop performance. Results indicate better performance by females on the 2 color cards but no difference on pure measures of performance.—*Journal abstract*.

11710. Gottfredson, Gary D. & Holland, John L. (Johns Hopkins U, Ctr for Social Organization of Schools) **Some normative self-report data on activities, competencies, occupational preferences, and ability ratings for high school and college students, and employed men and women. *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 192.**

11711. Greenstein, Theodore & Bennett, Richard R. (Washington State U) **Order effects in Rokeach's Value Survey.** *Journal of Research in Personality*, 1974(Dec), Vol 8(4), 393-396.—212 undergraduates completed a version of Rokeach's Value Survey in which the presentation order of the values was randomized. Each respondent received a unique randomization pattern. Spearman's  $\pi$  correlations were computed between the presentation order and the order of ranking done by the respondent. The magnitude of the correlations obtained was such that the amount of bias created by presentation order was sufficiently small as to suggest that order effects are not a problem in the instrument.—*Journal abstract.*

11712. Haft-Pomrock, Yael. **Psyche and soma in chirolgy: Personality changes in analysis as reflected in the hand.** *Spring*, 1974, 179-192.—Describes the importance of the hand and the meanings ascribed to the fingers and lines of the palm throughout history and in different cultures. 2 case histories are given of changes occurring in the lines of the hands of persons undergoing analysis.

11713. Hanson, David J. (State University Coll New York, Potsdam) **Dogmatism and authoritarianism: A bibliography of master's theses.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 128.

11714. Hekmat, Hamid; Khajavi, Farokh & Mehryar, Amir H. (U Wisconsin, Stevens Point) **Some personality correlates of empathy.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 89.—Administered R. Hogan's Empathy Scale and the Psychological Screening Inventory to 278 female and 167 male undergraduates. Results support the prediction that high-empathy persons are significantly lower in signs depicting neurotic and psychotic disturbance (e.g., anxiety) as compared with low-empathy persons.

11715. Hines, Caroline V.; Koepfel, John C. & Jacobs, Keith W. (U Southern Mississippi) **Locus of control as a variable in geographic mobility.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1282.—Scores on Rotter's Internal-External Control Scale were related to a questionnaire measure of planned geographic mobility, with Ss planning out-of-state mobility scoring as significantly more "internal" than Ss planning no mobility. Locus of control is suggested as a possible variable in geographic mobility.

11716. Horn, Joseph M. & Turner, Robert G. (U Texas, Austin) **Personality correlates of differential abilities in a sample of lower than average ability.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1211-1220.—Critics of IQ tests often emphasize the importance of nonintellectual components of intelligent behavior. Previous research has identified masculinity-femininity as one factor contributing to the differentiation of people along a dimension of high verbal ability at one end and high mathematical (or other "practical") ability at the other. However, almost all of this information was derived from the study of groups whose overall ability was about 1 standard deviation above the population mean. To test the generalizability of these findings, personality correlates of differential abilities (as measured by the Guilford-Zimmerman Temperament Survey) were investigated in 240 male and 165 female Mexican-

American undergraduates enrolled in a developmental studies class. Masculinity was related to the high mathematical-low verbal ability complex for females but not for males. The importance of studying the interaction of sex and type of ability is discussed. (22 ref)—*Journal abstract.*

11717. Horton, Paul C. **The mystical experience: Substance of an illusion.** *Journal of the American Psychoanalytic Association*, 1974, Vol 22(2), 364-380.—Presents a case history to illustrate a discussion of mystical experience. Such an experience may represent a culmination of a transitional mode of relatedness, and the experience itself may then become a transitional phenomenon. Multiple previous experiences with controlled illusion and hallucinogens may facilitate the experience. The quintessence of the mystical experience specifically, and of the transitional experience generally, is an upsurge of residual primary narcissism; such an upsurge can serve as a defense against overwhelming loneliness. Therefore the mystical experience can become a special, potentially adaptive, ego mechanism of defense. (25 ref)—*Journal summary.*

11718. Jacobs, Keith W. & Koepfel, John C. (U Southern Mississippi) **Biographical correlates of sensation-seeking: Form II and Form IV.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 192.

11719. Jensen, Arthur R. (U California, Inst of Human Learning, Berkeley) **How biased are culture-loaded tests?** *Genetic Psychology Monographs*, 1974(Nov), Vol 90(2), 185-244.—Conducted 3 studies in which the culture-loaded Peabody Picture Vocabulary Test (PPVT) and the culture-reduced Raven's Progressive Matrices (Colored and Standard forms) were compared on various internal criteria of culture bias; Ss were a total of 6,170 Anglo-American, black, and Mexican-American school children, from kindergarten through 8th grade, in 3 California school districts. On both the PPVT and the Raven, the 3 ethnic groups (which showed large mean differences) showed little difference in the rank order of item difficulties, the relative difficulty of adjacent items, the loadings of items on the first principal component, and the choice of distractors for incorrect responses. Analysis of variance (ANOVA) revealed very small Ethnic Group  $\times$  Items interaction, but an index of item bias derived from ANOVA indicates that the Raven was considerably less biased than the PPVT, especially in the Mexican-American group. The Group  $\times$  Items interaction was shown to be attributable largely to differences in mental maturity. On both tests groups of culturally homogeneous younger and older white children (separated by 2 yrs) perfectly simulated the white-black differences in Group  $\times$  Item interactions and choice of error distractors in the Raven. Certain expectations from a culture bias hypothesis were borne out only for the PPVT in the Mexican group. It is suggested that unless the empirically unsubstantiated assumption is made that culture bias affects all kinds of test items equally, the various item analyses of the present studies lend no support to the proposition that either the PPVT or the Raven is a culturally biased test for blacks. (16 ref)—*Journal abstract.*

11720. Keith, Regina R. & Vandenberg, Steven G. (U Colorado) **Relation between orality and weight.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1205-1206.—Tested the psychoanalytic theory of obesity by administering T. Grygier's (1970) Dynamic Personality Inventory to obese and normal-weight females. No significant differences between groups were found, and the tenability of the theory of obesity and suitability of the scales are questioned.

11721. Kiener, Franz. (Technical U Berlin, Inst for Psychology, W Germany) **[Research on body image: I.]** (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1973, Vol 21(4), 335-351.—Presents an extensive survey of the methods and results of past and contemporary research on body ego, body image, and body image boundaries and their ontogenetic development through various stages of age and development. The changes induced by various factors (e.g., sex difference, physical handicaps, organic brain damage, and mental disorders) are discussed. (English summary)—T. Fisher.

11722. Kratoch, Ronald; Leventhal, Gloria & Silverstein, Barry. (William Paterson Coll) **Self-perceived transformation of Negro-to-black identity.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1071-1075.—To examine changes in self-perceptions, 25 male and 25 female low-income, black undergraduates rated personal statements in accordance with how they (a) retrospectively viewed themselves (4 and 2 yrs ago), (b) currently viewed themselves, and (c) projectively viewed themselves. Responses showed a significant transition away from a past Negro to a present and future black identity. It is suggested that social and cultural forces over time probably led to changes in racial identity more than changes in personal identity.—*Journal abstract.*

11723. Levitt, Eugene E. et al. (Indiana U, Medical School, Indianapolis) **Testing the coercive power of hypnosis: Committing objectionable acts.** *International Journal of Clinical & Experimental Hypnosis*, 1975(Jan), Vol 23(1), 59-67.—Selected 14 hypnotically susceptible individuals and 9 simulators from groups of high and low scorers, respectively, on the Harvard Group Scale of Hypnotic Susceptibility, Form A. All Ss were asked to perform 2 objectionable acts, cutting up the American flag and mutilating a Bible. 25% of all Ss declined to carry out one or the other of the experimental tasks. While no conclusions can be drawn about the power of hypnosis to induce objectionable behavior, the findings appear to indicate clearly that objectionable behavior, as opposed to dangerous, criminal, or antisocial behaviors, can be used to test the coercive power of hypnosis. (German, French, & Spanish summaries) (16 ref) —*Journal abstract.*

11724. Liebling, Barry A.; Seiler, Marilyn & Shaver, Phillip. (National Analysts, Philadelphia, PA) **Unsolved problems for self-awareness theory: A reply to Wicklund's (see PA, Vol 53:Issue 6) reply to the authors' 1974 paper contains 5 major critical points, each of which is countered here. It is concluded (a) that Wicklund misinterprets drive theory, and (b) that his elucidation of the distinction between drive theory and self-awareness theory makes it clearer than before that**

Liebling et al's experiment does not support self-awareness theory as presently formulated. Questions remain which require further research.—*Journal abstract.*

11725. Littig, Lawrence W. (Howard U) **Personality, social class, occupational aspirations, and family size intentions of young, English men and women.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 122-123.

11726. Lucisano, Bruno. (Experimental Ctr for the Measurement of Children's Intelligence, Milan, Italy) **[The stress-value of events.]** (Ital) *Medicina Psicomatica*, 1972(Apr), Vol 17(2), 125-133. Reports on I. H. Holmes's studies of the stress-value of events, based on estimates by 394 Ss of the degree of social readjustment they would require after experiencing stressful events. Mean points for minor law violations were 11, for marriage 50, for death of spouse 100. The accumulation of 200-300 stress points in a year makes a person vulnerable to psychiatric and/or psychosomatic disorders. A comparison between a sample of Italians and Americans shows significant agreement between the 2 groups. (French & English summaries) D. I. Aron.

11727. Lund, Paul A. & Ivanoff, John M. (Muskego Intermediate School, WI) **Correspondence of self-concept measures with levels of reading achievement.** *Journal of Reading Behavior*, 1974(Jul), Vol 6(2), 149-165.—227 incoming freshmen were grouped in terms of reading ability, sex, and enrollment in a reading course. Using data from the College Entrance Examination Board, the Nelson-Denny Reading Test, and the Gough Adjective Check List, significant differences in self-concept were found among the groups, particularly between those who enrolled and those who did not enroll in the reading course. W. I. Chovan.

11728. Magnusson, David & Elchammar, Bo. (U Stockholm, Sweden) **Anxiety profiles based on both situational and response factors.** *Multivariate Behavioral Research*, 1975(Jan), Vol 10(1), 27-43. Argues that a comprehensive picture of an individual's anxiety pattern can be obtained by taking into account different types of anxiety reactions and different categories of stressful situations reacted to. An anxiety inventory utilizing these 2 factors was analyzed with regard to the anxiety profiles of different subgroups of 116 15-17 yr old students. The original situation and response scales were categorized on the basis of factor analyses in order to reduce the total matrix. Ss with similar response profiles across categories of situations were classified in homogeneous groups using latent profile analysis. For each sex, 3 categories of Ss were obtained, 2 of which differed mainly in anxiety level whereas the 3rd group was characterized by a high transsituational inconsistency. For the total sample, "Psychic" responses were reported as more intense than "Somatic" responses, and "Anticipation fear" situations were reported as less anxiety provoking than "Inanimate threat" situations and "Threat of punishment" situations. (29 ref) *Journal abstract.*

11729. Mahler, Irwin. (Occidental Coll) **A comparative study of locus of control.** *Psychologia: An International Journal of Psychology in the Orient*, 1974(Sep), Vol 17(3), 135-139.—Describes the preparation of a Japanese translation of the Levenson (PC) Scale, a revision of

Rotter's I-E Scale. The Levenson scale was administered to university students of both sexes in Japan and the US. American students scored in a more internal direction than the Japanese. Japanese students felt themselves to be more controlled by chance or luck; but contrary to prediction, they did not score higher on control by powerful others. However, Japanese females scored significantly higher than Japanese males in this respect.—R. D. Nance.

11730. Mathers, James. (Radnor House, Hay on Wye, England) **The gestation period of identity change.** *British Journal of Psychiatry*, 1974(Nov), Vol 125, 472-474.—Discusses the hypothesis that critical experiences which initiate change in a person's sense of identity are not usually emotionally digested until about 18 mo have elapsed. It is suggested that the hypothesis has significant implications for those programs in education and therapy from which personality change commonly results and that the effectiveness of such programs cannot be adequately assessed in less than 18 mo from their initiation.—*Journal summary*.

11731. Mehryar, A. H.; Khajavi, F. & Helmat, H. (Pahlavi U, Shiraz, Iran) **Comparison of Eysenck's PEN and Lanyon's Psychological Screening Inventory in a group of American students.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 9-12.—Administered Eysenck's Psychoticism, Extraversion, and Neuroticism Inventory and the Psychological Screening Inventory (PSI) to 178 male and 297 female undergraduates. Included in the study was an 18-item Lie scale taken from the Eysenck Personality Inventory. A factorial analysis of the intercorrelations showed that 3 major factors could account for the bulk of correlations among the 9 differently labeled characteristics covered by the 2 inventories. These 3 factors were identified as Psychological Disturbance, Extraversion, and Defensiveness, respectively. The 1st factor was characterized by alienation, psychoticism, discomfort, and neuroticism. The 2nd factor was mainly identified by high loadings on Eysenck's Extraversion and the PSI Expression scales. The Defensiveness factor was mainly marked by the Lie scale and the PSI Defensiveness scale. The PSI Social Nonconformity scale loaded equally moderately on both the Psychological Disturbance and Defensiveness factors for both male and female groups. In the case of the male group, its highest loading was on the Extraversion factor. (16 ref)—*Journal abstract*.

11732. Merrens, Matthew R. & Garrett, James B. (State U New York, Plattsburgh) **The Protestant Ethic Scale as a predictor of repetitive work performance.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 125-127.—Administered the Protestant Ethic Scale as part of a large test battery to 333 undergraduates. 40 male and female Ss, of whom 20 had scored at least 1 standard deviation above the mean score on the Scale (high Protestant ethic group) and 20 had scored at least 1 standard deviation below that mean (low Protestant ethic group), were selected to participate in a repetitive task. Results show that the high Protestant ethic group spent significantly more time working on the task ( $p < .01$ ) and produced significantly more output ( $p < .001$ ). It is concluded that the type of work

behavior studied is a component of the Protestant ethic personality variable.—*Journal abstract*.

11733. Metcalfe, R. J. (Trinity & All Saints' Coll.) Leeds, England. **Own vs provided constructs in a repeated measure of cognitive complexity.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1305-1306.—On Kelly's Role Construct Repertory Test, both cognitive complexity and cognitive differentiation scores of 50 education students were calculated using own vs provided constructs. Both indices were significantly correlated over treatments, but they were independent of each other.

11734. Millham, Jim. (U Houston) **Two components of need for approval score and their relationship to cheating following success and failure.** *Journal of Research in Personality*, 1974(Dec), Vol 8(4), 378-392.—50 male and 41 female undergraduates completed a simulated "intelligence test" on which they were given bogus feedback indicating that they had either met college norms or had failed substantially to meet norms. Immediately following was a period in which Ss could modify their scores and believe that their modification would go undetected. The relationship of need for approval to "cheating" and amount of "cheating" was analyzed. Need for approval was measured by the Marlowe-Crowne Social Desirability scale. Results support an "avoidance" interpretation of approval motivation. 2 separate components of need for approval score were identified and found to be differentially related to avoidance behavior for men and for women. (15 ref)—*Journal abstract*.

11735. Mlott, Sylvester R. & Mlott, Yvonne D. (Medical U South Carolina) **Dogmatism and locus of control in individuals who smoke, stopped smoking and never smoked.** *Journal of Community Psychology*, 1975(Jan), Vol 3(1), 53-57.—Tested the hypothesis that individuals who are able to terminate their smoking habits are less dogmatic and more internally controlled than those who continue to smoke or have never smoked. 25 men and 25 women were studied in each of 3 categories: terminated smoking, never smoked, and smoking. Both the Rokeach Dogmatism Scale and the Rotter Internal-External Control Scale were administered. Results show that (a) there was a significant ( $p < .05$ ) interaction between sex and smoker in relation to dogmatism score: males generally scored higher than females; (b) male nonsmokers were lowest on dogmatism; (c) no significant differences were obtained among the 3 female groups; and (d) Ss who had stopped smoking were more internally controlled than those who smoked or had never smoked. (18 ref)—R. S. Albin.

11736. Naditch, Murray P. (Cornell U) **Locus of control and drinking behavior in a sample of men in Army basic training.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 96.—Studied the relationship between internal-external control and drinking behavior in 517 men in basic training whose drinking behavior ranged from abstinence to problem drinking. Results show a clear pattern of increased externality with increased drinking.

11737. Netter-Munkelt, P. & Meyer, A. E. (U Mainz, Inst of Medical Statistics & Documentation, W Germany) **Sex differences in the intercorrelations of psychofe-**

mininity-masculinity variables.] (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1973, Vol 21(4), 352-375.—Examined data obtained from 61 male and 61 female students to study the question of whether there exist sufficiently significant sex-specific differences in the intercorrelations of psychic variables to explain the different androgyny patterns of men and women. Ss were tested by masculinity-femininity questionnaires and Es compared the correlations and factor matrices from questionnaire scale scores and single questionnaire items. Results indicate that only 2 associations (femininity-schizothymia and masculinity-cyclothymia) and 3 factors (sturdiness, care for others, and social dominance) were common to both groups. The discrepancies between all the other factor pairs could not be compensated even by similarity rotation of factor matrices. It is concluded that the dimensions of psychomascularity-femininity in the 2 sexes are different and that the difference in the intercorrelations of psychic and morphologic variables in men and women may be understood as a consequence of their different psychic configurations. (English summary) (34 ref)—*T. Fisher*.

11738. Neuringer, Charles; Goldstein, Gerald & Gallahe, Richard B. (U Kansas) **Minimal field dependency and minimal brain dysfunction.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 20-21.—Hypothesized that the "normal range" of field dependency may be associated with minimal levels of undiagnosed brain damage. Data from 54 undergraduates given the Rod-and-Frame test and the Halstead Neuropsychological Test Battery suggest that there is a small but significant relationship between field dependency and performance on tests sensitive to brain dysfunction.

11739. Nogas, Catherine; Schweitzer, Kathy & Grumet, Judy. (Mt Holyoke Coll) **An investigation of death anxiety, sense of competence, and need for achievement.** *Omega: Journal of Death & Dying*, 1974(Fal), Vol 5(3), 245-255.—80 female undergraduates were administered 4 written questionnaires (e.g., the California Psychological Inventory) measuring death anxiety, sense of competence, need for achievement, and general anxiety. An open-ended question on the personification of death was also included. As predicted, a negative correlation was found between death anxiety and sense of competence. No correlation was found between death anxiety and need for achievement and no interaction effect occurred between need for achievement and sense of competence. General anxiety correlated highly with death anxiety. Degree of death anxiety and type of personification were also related.—*Journal abstract*.

11740. Nuttall, Ronald L. & Poggio, John P. (Boston Coll) **A cross-cultural, American and Puerto Rican study of personality structure.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 193.

11741. Parlee, Mary B. & Rajagopal, Jayalakshmi. (Radcliffe Inst, Cambridge, MA) **Sex differences on the Embedded-Figures Test: A cross-cultural comparison of college students in India and in the United States.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1311-1314.—Administered the Embedded Figures Test to 24 male and 24 female US undergraduates and to 23

male and 24 female Indian undergraduates. Data show significant sex differences, with males scoring higher than females in both samples ( $p < .01$ ). Some considerations relevant to the interpretation of such data are briefly discussed. (17 ref)—*Journal abstract*.

11742. Radley, A. R. (Loughborough U, England) **The effect of role enactment upon construed alternatives.** *British Journal of Medical Psychology*, 1974(Dec), Vol 47(4), 313-320.—Conducted a study of a total of 20 university students to examine how individuals choose between alternative roles which they might play. 10 Ss were asked to outline from their usual perspectives, and then to enact in written form, those roles which they were most and least prepared to extend in the future. Results indicate that Ss were more prepared to change in ways outlined by use of the enactment procedure, and indicated these ways of changing to be of greater possible use to them than ways outlined from their usual role perspectives. A control procedure did not produce this effect when used by the other group of 10 Ss. It is argued that role enactment may be a formalized reflection of the constructive process through which a person is able to make explicit the alternative roles which his personal constructs define, in order that he might choose between them.—*Journal summary*.

11743. Ray, John J. (U New South Wales, Kensington, Australia) **Are trait self-ratings as valid as multi-item scales? A study of achievement motivation.** *Australian Psychologist*, 1974(Mar), Vol 9(1), 44-49.—13 sociology students administered to Ss they selected a questionnaire composed of attitude scales that measure achievement motivation and a 5-point self-rating scale on need achievement. The 30-item Ray-Lynn "AO" scale and the 10-item Costello Task Orientation scale were used to measure achievement motivation. They correlated .323 and .243 with peer-rated need for achievement. Self-rating correlated only .19 with peer rating. Results support the expectation that multi-item scales do provide an increment in validity. (15 ref)—*J. C. Figurelli*.

11744. Reavley, William. (Graylingwell Hosp, Chichester, England) **The relationship of life events to several aspects of "anxiety."** *Journal of Psychosomatic Research*, 1974(Dec), Vol 18(6), 421-424.—18 male and 22 female Ss completed the Social Readjustment Rating Scale (SRRS), a modified form of the Taylor Manifest Anxiety Scale, the Anxiety Questionnaire of the Institute for Personality and Ability Testing, and the symptom rating test (a sensitive measure of "state" anxiety). Scores on the SRRS correlated highly with the somatic concomitants of anxiety, a feeling of inadequacy, and concern with ability to realize self ideals.—*W. G. Shipman*.

11745. Regan, Judith W.; Gosselink, Holly; Hubsch, Janet & Ulsh, Elizabeth. (Wells Coll) **Do people have inflated views of their own ability?** *Journal of Personality & Social Psychology*, 1975(Feb), Vol 31(2), 295-301.—Conducted 2 experiments with a total of 98 female undergraduates to test a need-for-self-esteem notion that people inflate self-appraisals of ability, deny criticism, and overrespond to praise. In Exp I actor Ss and bystander Ss rated actors' performances on a nonobjective task after hearing the performance praised or criticized or before hearing it evaluated. No evidence of

self-enhancement was found: compared to bystanders, actors rated themselves harshly, lowered their ratings after criticism equally, and showed relief after praise. Exp II compared actor and bystander ratings of actors who expected evaluation of their performances or who expected no evaluation. Results suggest self-derogation by actors as a defense against possible loss of self-esteem. (15 ref)—*Journal abstract*.

11746. Robbins, Fred P. & Sadow, Leo. (Chicago Inst for Psychoanalysis, IL) **A developmental hypothesis of reality processing.** *Journal of the American Psychoanalytic Association*, 1974, Vol 22(2), 344-363.—Describes the evolution of the function of reality processing beyond basic reality testing. A developmental approach is utilized. Reality processing is seen as primarily dependent on object relations and self-development. Biological and sociocultural contexts within which the psychological factors operate are briefly commented upon. (29 ref)—*Journal summary*.

11747. Roll, Samuel & Hertel, Paula. (U New Mexico) **Arrow-Dot measures of impulse, ego, and superego functions in noncheaters, cheaters, and supercheaters.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1035-1038.—The Impulse (I), Ego (E), and Superego (S) scales of the Arrow-Dot subtest (from the IES Test) and the Psychopathic Deviance scale of the MMPI were correlated with a measure of resistance to temptation. Using data from 76 male undergraduates (classified as noncheaters, cheaters, or supercheaters) positive correlations ( $p < .05$  and  $p < .001$ ) were found between the Impulse scores and yielding to temptation and the Ego scores and resistance to temptation. The correlations of the Psychopathic Deviance scale with both the Arrow-Dot test and the behavioral measure were not significant. The study provides evidence for the predictive validity of the Arrow-Dot test.—*Journal abstract*.

11748. Rotter, Julian B. (U Connecticut) **Some problems and misconceptions related to the construct of internal versus external control of reinforcement.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 56-67.—Research involving perceived internal vs external control of reinforcement as a personality variable has been expanding at a rapid rate. It seems clear that for some investigators there are problems associated with understanding the conceptualization of this construct as well as understanding the nature and limitations of methods of measurement. This article discusses in detail (a) the place of this construct within the framework of social learning theory, (b) misconceptions and problems of a theoretical nature, and (c) misuses and limitations associated with measurement. Problems of generality-specificity and unidimensionality-multidimensionality are discussed as well as the logic of predictions from test scores. (35 ref)—*Journal abstract*.

11749. Schatzberg, Alan F.; Westfall, Michael P.; Blumetti, Anthony B. & Birk, C. Lee. (McLean Hosp, Belmont, MA) **Effeminacy: I. A quantitative rating scale.** *Archives of Sexual Behavior*, 1975(Jan), Vol 4(1), 31-41.—Describes the evaluation of a 67-item yes-no rating scale for effeminacy in homosexual males. The presence or absence of 37 behaviors is recorded, and 30 questions dealing with dress and grooming, based on the

hypothesis that such a dress-grooming scale would correlate poorly with indicators of effeminacy, are included. The scale was evaluated in individual interviews conducted with 16 homosexual and 16 heterosexual 21-50 yr old males. Results show that there were no significant differences between heterosexual and homosexual Ss on the Dress-Grooming scale. Data on the relationship between Kinsey numbers and effeminacy ratings are presented. It appears that knowledge of S's effeminacy rating is of little predictive value in determining his sexual orientation. High interrater reliability was obtained (.93) which suggests that the scale can be of value in studying effeminacy quantitatively. (15 ref)—*L. Gorsev*.

11750. Schill, Thomas & Althoff, Michael. (Southern Illinois U, Carbondale) **Drug experiences, knowledge, and attitudes of high- and low-guilt individuals.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 106.—Administered the Mosher Forced-Choice Guilt Inventory and a drug attitude and use questionnaire to 121 undergraduates. Findings clearly indicate a relationship between guilt and experience, attitudes, and knowledge about drugs and support D. Mosher's view that guilt as a personality predisposition results in the inhibition of behaviors that are culturally prohibited.

11751. Schneider, Johann F. & Schneider-Düker, Marianne R. (U Saar, Saarbrücken, W Germany) **Conservative attitudes and reactions to menstruation.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1304.—Results of a previous study by R. Ullrich (1973) show a significant correlation between female university students' scores on a German version of the Wilson-Patterson Conservatism Scale and various menstrual complaints. Additional data by the present authors suggest that conservative attitudes do not greatly influence somatic and psychic experiences of the menses but determine to some degree the way of handling possible somatic and psychic consequences.

11752. Schumacher, Gerhard & Cattell, Raymond B. **[Factor analysis of the German HSPQ: Investigations of the cross-cultural constancy of primary personality factors.]** (Germ) *Zeitschrift für Experimentelle und Angewandte Psychologie*, 1974, Vol 21(4), 621-636.—Translated Forms A and B of R. B. and M. D. Cattell's High school Personality Questionnaire (HSPQ) into German and added 56 new items. Administration of the German HSPQ to 327 pupils 14-15 yrs old, factor analysis of the results, and rotation to maximum simple structure yielded 14 primary personality factors which correspond with high significance to the congruence coefficients of the American HSPQ. Consequently the structure of the primary personality factors in American and German pupils is basically the same. (English & French summaries) (29 ref)—*W. J. Koppitz*.

11753. Seitz, Frank C.; Andersen, Dennis O. & Braucht, George N. (Montana State U) **A comparative analysis of Rorschach signs of homosexuality.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1163-1169.—Previous research has suggested that content analysis of the Rorschach may be a useful tool in diagnosing homosexuality. To test this position, 5 Rorschach sign approaches were compared within a 3-group design employing a total of 45 heterosexual, sex-role disturbed, and homo-

sexual male psychiatric inpatients. Results indicate that all signs were able to differentiate the homosexual and heterosexual groups, but only R. Schafer (1954) and G. Ulett's (1950) signs discriminated between the sex-role disturbed and homosexual groups. Step-wise discriminant analyses were computed to determine what combinations of signs could most accurately differentiate the 3 groups.—*Journal abstract.*

11754. Sewell, Trevor E. & Severson, Roger A. (Temple U) **Intelligence and achievement in first-grade black children.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 112.—Studied the relationship between WISC IQ and academic achievement (Stanford Achievement Test) in 84 regularly placed 1st-grade black children. Subtest scores, intercorrelations, and IQ-achievement relations suggest that this sample differs from the WISC normative population and urge caution in the use of the individual subtests for diagnostic or predictive purposes.

11755. Shakurov, R. Kh. (Scientific Research Inst of Psychology, Kiev, Ukrainian SSR) **[A psychological analysis of the leadership quality of school directors.]** (Russ) *Voprosy Psikhologii*, 1974(Jul Aug), No 4, 105-114. Studied the structure of leadership among the directors of 38 outstanding and 35 average schools. Ss were rated by the teaching staff on 36 characteristics, sociometric studies were conducted, and questionnaire data collected. Reliability and validity of the measures were established, and Kendall's tau coefficients computed for all pairs of data. 5 personality characteristics appeared to underlie superior leadership: effective communication, group-based leadership, businesslike efficiency, innovation, and expectation of performance. Leadership was characterized not by one of these attributes but by all of them. The most important was group-based leadership, which was closely related to effective communication and dealing with people. This complex attribute differentiated the leadership styles of directors of the outstanding and the average schools. (English summary)—L. Zusne.

11756. Spreitzer, Elmer; Snyder, Eldon E. & Larson, David. (Bowling Green State U) **Age, education, and occupation as correlates of the meaning of leisure.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1105-1106.—Examined the extent to which leisure activity serves as a source of self-identity. Data from a mail survey of 236 males and 121 females aged under 65 yrs indicates that when age, education, and occupation were predictor variables, only about 10% of the variance in meanings was accounted for.

11757. Svinicki, John G.; Bundgaard, Christopher J.; Schwensohn, Carl H. & Westgor, Daniel J. (U Texas, Austin) **Physical activity and visual field-dependency.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1237-1238.—Results of administering the rod-and-frame test to active and inactive male and female students show no significant sex differences, that inactive Ss had more difficulty in adjusting the rod to true verticality on the 1 trial given, and that physically inactive Ss may be more dependent on the visual field than the active Ss.

11758. Tobacyk, Jerome J.; Broughton, Andrew & Vaught, Glen M. (State University Coll New York, Oswego) **Effects of congruence-incongruence between**

**locus of control and field dependence on personality functioning.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 81-85.—Studied H. Lefcourt and M. Telegdi's (see PA, Vol 47:903) concepts of congruence and incongruence between perceptual skills and expectancies. 132 undergraduates were given Rotter's Internal-External Control Scale and the rod-and-frame test. 4 groups were formed, with 5 male and 5 female Ss with extreme scores in each group. As predicted, the 2 theoretically congruent groups demonstrated better personality adjustment on a real-self, ideal-self Q sort than did the incongruent groups. The congruent groups also proved to be less susceptible to the autokinetic effect than did the incongruent groups.—*Journal abstract.*

11759. Wagner, Carl; Bourgeois, Anthony; Levenson, Hanna & Denton, Jane. (Texas A&M U) **Multidimensional locus of control and voluntary control of GSR.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1142.—Used H. Levenson's multidimensional locus of control scale with undergraduate Ss in order to understand more precisely the relationship between personality and the ability to control galvanic skin response (GSR) using biofeedback. It was found that those Ss who were best able to lower their GSR had significantly higher Internal (control of self) scale scores than those who could not make use of the biofeedback.

11760. Wagstaff, Graham F. (U Newcastle upon Tyne, England) **The effects of repression-sensitization on a brightness scaling measure of perceptual defence.** *British Journal of Psychology*, 1974(Aug), Vol 65(3), 395-401.—Investigated the relationship between perceptual sensitivity and stimulus emotionality employing a methodology designed to preclude the intervention of response variables. 23 male and 23 female university students estimated the relative brightness of pairs of physically identical light signals superimposed on subliminal words presented below the awareness threshold. The Repression-Sensitization (R-S) scale was used as a possible personality correlate. Results support the perceptual defense hypothesis, and significant differences in modes of responding were found between sexes and categories on the R-S scale.—*Journal abstract.*

11761. Wakefield, James A. et al. (U Houston) **Personality types and traits in the Vocational Preference Inventory.** *Journal of Vocational Behavior*, 1975(Feb), Vol 6(1), 19-26.—Investigated the relationships between the 6 scales on which J. L. Holland's (1973) theory is based (Realistic, Investigative, Social, Conventional, Enterprising, and Artistic) and the 5 other scales of the Vocational Preference Inventory (VPI) developed by Holland in 1970 (Self-control, Masculinity Status, Infrequency, and Acquiescence), using canonical analysis. Considering the 6 personality-type scales as set of variables and the 5 trait scales of the VPI as the 2nd set of variables, 5 significant canonical correlations were obtained for 373 (mostly white) undergraduates. In a 2nd study, 3 significant canonical correlations were found for 115 black college students at another school. The weights of the VPI scales suggest that 3 patterns of relationships among the scales were shared by the black sample and the mostly white sample.—*Journal abstract.*

11762. Weisgerber, Charles A. (U Detroit) **A review of research on the use of the Minnesota Multiphasic**

**Personality Inventory (MMPI) with Catholic nuns, 1950-1973.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 192-193.

11763. Weitzenkorn, Steven D. (U Nebraska, Lincoln) **An adjusted measure of achievement motivation for males and females and effects of future orientation on level of performance.** *Journal of Research in Personality*, 1974(Dec), Vol 8(4), 361-377.—Developed an adjusted measure of achievement motivation using the Mehrabian Achievement Scale and Sarason's Test Anxiety Questionnaire. Ss were 59 female college and 279 high school students. Contingent instructions, in which college Ss were told success on a test was necessary to qualify for opportunities to succeed on subsequent tests (Exp I), were contrasted to performance in equivalent noncontingent situations and relative to adjusted achievement motivation for both male and female high school Ss (Exp II). In noncontingent situations Ss were told performance on any one test did not affect their opportunity to take subsequent tests. Support was obtained for the use of the above mentioned scales as a predictor of performance for both sexes but not for the Mehrabian by itself. Both male and female Ss high in achievement motivation consistently scored significantly higher than Ss low in achievement motivation in all conditions. Results do not provide statistically reliable support to the elaborated theory of achievement motivation. (17 ref) —*Journal abstract*.

11764. Wicklund, Robert A. **Discrepancy reduction or attempted distraction? A reply to Liebling, Seiler, and Shaver.** *Journal of Experimental Social Psychology*, 1975(Jan), Vol 11(1), 78-81.—In the context of an experiment that shows enhanced cigarette smoking due to the presence of a mirror, B. A. Liebling et al (see PA, Vol 52:12184) argued that drive theory has been pitted successfully against self-awareness theory. It is noted, however, that their experimental conditions did not allow for an unambiguous application of either theory, and that their results have little to say about the relative accuracy of the 2 theoretical approaches.—*Journal abstract*.

11765. Wilkie, Raymond. (U Kentucky, Coll of Education) **Authenticity in helping relationships.** In *Selected papers delivered at The Ninth Annual West Virginia School on Alcohol and Drug Abuse Studies*, June 17-22, 1973. Morgantown, WV: West Virginia University, 1973. 165 p.—Presents a model of authentic personhood, arguing that effective helping relationships are not merely techniques but must be an integral part of the helper. Authenticity includes the concept of psychological health, but goes beyond it to include the response of a helper who is an integrated person, seeking a more authentic life for himself, to another person for whom the helper desires authentic, integrated personhood.

11766. Witte, Hannelore & Witte, Erich H. (U Hamburg, Psychologisches Inst, W Germany) **[Self-descriptions of actual and ideal personality by juveniles from different social strata and by juvenile delinquents.]** (Germ) *Zeitschrift für Sozialpsychologie*, 1974, Vol 5(3), 219-232.—Studied the differences between personality self-descriptions of the "real self" and "ideal self" by 222 German male adolescents 16-18 yrs old as a function of their socioeconomic status. Students and a

special sample of juvenile delinquents answered the Cattell 16 Personality Factor Questionnaire, first as they believed themselves actually to be and then as they wished themselves to be. Differences between "real" and "ideal" self were largest for the highest social level and smallest for the juvenile delinquents. Ratings for "real self" were similar across social strata, while "ideal self" ratings were dissimilar. "Real self" ratings differed more between social strata in the emotionality sphere than in the extraversion sphere. Adolescents from higher socioeconomic levels described themselves as more radical than those from lower strata, and delinquents showed less persistence than matched groups of lower-class adolescents. (23 ref)—*English abstract*.

11767. Wortman, Camille B. (Northwestern U) **Some determinants of perceived control.** *Journal of Personality & Social Psychology*, 1975(Feb), Vol 31(2), 282-294.—Tested the hypothesis that an individual will feel control over an outcome if he causes the outcome and if he knows before causing it what he hopes to obtain. 65 male undergraduates were shown 2 consumer items and told that they would get to win 1 by a chance drawing. 2 marbles of different colors were placed in a can and mixed up. One-third of the Ss were told that the E would pick a marble to determine their prize and were told beforehand which marble stood for which prize. Another third were told to select a marble to determine their prize and were told beforehand which marble stood for which prize. The remaining Ss were told to select a marble to determine their prize but were not told until after they had picked their marble which marble stood for which prize. Ss then received a marble which led them to win either the item they preferred or the item they did not prefer. Results strongly support the hypothesis: Ss who caused their own outcome and knew beforehand what they hoped to obtain perceived themselves to have more control over the outcome, more choice about which outcome they received, and more responsibility for their outcome than Ss in the remaining conditions. These results were replicated in a 2nd experiment with the same Ss. The relationship between these studies and previous experiments on control is explored, and some possibilities for future research on control are considered. (23 ref) —*Journal abstract*.

11768. Wunderlich, Richard A. (Catholic U of America) **Personality characteristics of super-obese persons as measured by the California Psychological Inventory.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1029-1030.—Results of a study of 23 super-obese males and females (mean weights = 341 and 263 lbs, respectively) show that females scored significantly differently from the normative group on 6 of the 15 California Psychological Inventory scales and males were different from the normative group on 9 scales.

11769. Yurkevich, V. S. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General & Pedagogical Psychology, Moscow) **[Individual differences in self-regulation and the ability to learn.]** (Russ) *Voprosy Psikhologii*, 1974(Jul-Aug), No 4, 84-95.—Studied the relationship between learning ability and a number of indices of self-regulation. 31 9th graders participated. Learning ability was assessed by asking teachers to evaluate each student on his facility in

learning, and by computing each student's grade point average. Self-regulation indices were obtained from Brunder's task of artificial concept formation, response time stability, attentiveness, and questionnaire data concerning the S's behavior in everyday life. The high correlations among the indices of self-regulation are taken to indicate the existence of a general factor of self-regulation, and their correlation with school performance is considered to support the idea that individual differences in self-regulation are related to that aspect of general intelligence that manifests itself as learning ability. (English summary) (44 ref)—L. Zusne.

11770. Zuckerman, Miron & Gerbasi, Kathleen C. (U Rochester) **The relationship between four factors of Rotter's I-E Scale and other personality and attitudinal measures.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 191.

## PROFESSIONAL PERSONNEL

11772. Androghetti, Teresa. (Appalachian Regional Hosp, AR-CAP, Beckley, WV) **The nurse and the alcoholic patient.** In *Selected papers delivered at The Ninth Annual West Virginia School on Alcohol and Drug Abuse Studies, June 17-22, 1973*. Morgantown, WV: West Virginia University, 1973. 165 p.—Discusses the quality of the nursing care received by the alcoholic patient from the viewpoint of adequate preparation of the nurse. The role and training of the nurse as conceived and implemented by the Appalachian Regional Comprehensive Alcoholism Program are detailed.

11773. Bachrach, Henry; Luborsky, Lester & Mechanick, Philip. **The correspondence between judgements of empathy from brief samples of psychotherapy, supervisors' judgements and sensitivity tests.** *British Journal of Medical Psychology*, 1974(Dec), Vol 47(4), 337-340.—Conducted a study of 25 psychiatric residents to investigate the relationship between segment-based judgments of empathy and skill with supervisors' ratings of empathy and skill based on 6 mo or more of meetings with each therapist. The Sundberg Test of Implied Meanings was employed as a measure of the therapist's ability to detect implied verbal meanings; the Spence-Rubin Double Profile was used as a measure of the therapist's sensitivity to nonverbal, subliminal cues. Results show that (a) judgments of empathy and skill obtained from brief segments correlated significantly with such judgments obtained from supervisors; (b) not only with such judgments obtained from supervisors and systematic relationships emerged between empathy and skill and the other sensitivity measures; and (c) the ability to detect implied verbal meanings was related to judgments of empathy and skill obtained from segments, but not supervisors' estimates of the same qualities. (Ontario Dept of Health, Canada) **Advisory council provincial associations of psychologists: Archival comment.** *Canadian Psychologist*, 1974(Oct), Vol 15(4), 368-375.—Presents an account of the origins, growth, and current programs of the Advisory Council of Provincial Associations of Psychologists. The new national organization is discussed in relation to the Canadian Psychological Association, and some ongoing tensions in Canadian psychology are elaborated. (French abstract)

11776. Boyd, John D. & Pate, Robert H. (U Virginia) **An analysis of counselor verbal response scale scores.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 198.

11777. Carrera, Michael A. & Rosenberg, Gary. (Hunter Coll, Inst of Health Sciences, City U New York) **Inservice education in human sexuality for social work practitioners.** *Clinical Social Work Journal*, 1973, Vol 1(Special Issue), 261-267.—Outlines inservice human sexuality seminars developed at a medical center on Long Island. Emphasis in the training is on general education, rather than specific therapeutic and technical approaches. Rationale for the curriculum is provided. Cognitive, affective, and skill components combine to make up the total program. Though research evaluation of the seminars' effects has not yet been done, positive feedback from participants has been obtained.—S. R. Stein.

11778. Carroll, Jean & Becker, Selwyn. **The paucity of course work in medical care evaluation.** *Journal of Medical Education*, 1975(Jan), Vol 50(1), 31-37.—Out of 107 medical schools responding to a mailed survey, 24 indicated that they were providing training in the techniques of medical care evaluation. The need for physicians to become familiar with the principles and methods of scientific evaluation of medical care is discussed.

11779. Carter, Dianne K. & Pappas, James P. (U Iowa, Counseling Service) **Systematic desensitization and awareness treatment for reducing counselor anxiety.** *Journal of Counseling Psychology*, 1975(Mar), Vol 22(2), 147-151.—Compared the effects of systematic desensitization, an awareness treatment designed to increase awareness of interpersonal anxiety, and no treatment on the reduction of counselor's anxiety. 4 counseling graduate students assigned to 1 of the treatment conditions served as Ss. With treatment intervening, Ss participated in pre- and postcounseling interviews with a client-accomplice. A multivariate analysis of postanxiety measures showed no difference between the treatment groups, but in comparison to the no-treatment control group both treatments were associated with significant anxiety reduction on 4 measures related to speech disturbance, extraneous body move-

ment, and self-reported anxiety. (24 ref)—*Journal abstract*.

11780. Degner, Lesley. (U Manitoba, School of Nursing, Winnipeg, Canada) **The relationship between some beliefs held by physicians and their life-prolonging decisions.** *Omega: Journal of Death & Dying*, 1974(Fal), Vol 5(3), 223-232.—Developed a Guttman scale to elicit physicians' tendencies in regard to life-prolonging decisions. 92 physicians in a nonsectarian hospital returned a mailed questionnaire containing the scale. It was found that the great majority (79.4%) of the Ss favored withdrawing treatment from terminally ill patients in at least 2 out of 3 imaginary situations. A comparison of the Ss' life-prolonging decisions by their beliefs in God and afterlife yielded no significant differences. Comparison of the Ss' life-prolonging decisions by their beliefs about death indicated that physicians who favored withdrawal of treatment from terminally ill patients viewed death more as a negative than as a neutral or positive phenomenon. (17 ref)—*Journal abstract*.

11781. Doyle, Brian B. & Smith, Walter J. (George Washington U, School of Medicine & Health Sciences) **Using short-term intervention with priests.** *Hospital & Community Psychiatry*, 1975(Jan), Vol 26(1), 30-32.—Discusses a short-term group program designed to increase priests' effectiveness in helping others. 10 1½-hr weekly sessions were held with 6 priests, aged 23-47 yrs, to increase their knowledge of mental health resources, break down stereotypes of mental health professionals and priests, and help them deal with changes occurring in the church organization. It was found that the priests were able to deal only superficially with issues such as identity and intimacy, but as a result of the experience, they could cope better with their day-to-day work and were better able to use mental health professionals as consultants.—*Journal abstract*.

11782. Dörken, Herbert. (U California, Langley Porter Neuropsychiatric Inst, San Francisco) **Private professional sector innovation in higher education: The California School of Professional Psychology.** *Journal of Community Psychology*, 1975(Jan), Vol 3(1), 15-21.—Describes the Doctor of Psychology (PsyD) degree program offered by the California School of Professional Psychology, the only autonomous school in psychology in the country to offer this degree. The process leading to the funding, approval, and establishment of this school is discussed, and its educational innovations are outlined. Faculty appointments range from 1/5 to 3/4 time, over half of these being 1/2 time. The balance of the teaching load is carried by contract instructors. Since its inception in 1970 the number of formal applications for admission, complete with application fee, has substantially exceeded the projected student openings. Currently, there are 527 full-time students. The present curriculum model is described as emphasis on the need for well-trained professions. For those entering with a BA, completion of the PsyD can be done within 4 yrs; for those entering as PhD candidates, completion normally takes 2 yrs. The critical factor in training is that, throughout the program, students must demonstrate a capacity and interest for involvement in social problems and helping people.—R. S. Albin.

11784. Elthammar, Olof. [A training program for mental health personnel in a northern county of Sweden.] (Swed) *Psykisk Hälsa*, 1972, Vol 13(2), 127-132.

11785. Eskedal, Glen A. (Suffolk U) **Symbolic role modeling and cognitive learning in the training of counselors.** *Journal of Counseling Psychology*, 1975(Mar), Vol 22(2), 152-155.—Investigated the effects of symbolic role modeling on the cognitive learning of counseling techniques. The purpose was to test the relative efficacy of 2 different symbolic role modelings on the desired learning. The posttest-only control group design was used. Ss were 56 master's level counselor education students randomly assigned to the following treatment groups: (a) symbolic role modeling with attentional variables, (b) symbolic role modeling only, (c) control with attentional variables, and (d) control only. Results show statistical significance ( $p < .05$ ) in the level of acquisition responses by the 2 modeling treatments over the 2 control treatments and the modeling treatment with attentional variables over the modeling-only treatment. Implications for practice are discussed.—*Journal abstract*.

11786. Eysenck, H. J. (Inst of Psychiatry, London, England) **Some comments on the relation between A-B status of behavior therapists and success of treatment.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 86-87.—Argues that several weaknesses in L. E. James and M. E. Foreman's (see PA, Vol 51:7703) study do not support their conclusion that the A-B therapist variable is associated with outcomes of behavior therapy. The authors' concept of enuresis as a neurotic disorder is questioned, and the failure of the experimental design to insure a random assignment of the therapist to each case and the failure to investigate personality factors in both the children and their mothers are examined.

11787. Fischer, Michael J. & Apostol, Robert A. (U North Dakota) **Selected vocal cues and counselor's perceptions of genuineness, self-disclosure, and anxiety.** *Journal of Counseling Psychology*, 1975(Mar), Vol 22(2), 92-96.—Investigated whether or not selected vocal cues emitted by a counselee influence the perception of her personality by observing counselors. Ss were 20 male and 20 female 2nd-semester master's level students in counseling and guidance. 2 vocal cues (filled and unfilled pauses) were selected, and it was determined whether a difference existed between them in their influence on the perception of the counselee's genuineness, self-disclosure, and anxiety. A significant difference was found among selected filled and unfilled pauses in the perception of self-disclosure but not in the perception of genuineness or anxiety. Findings are discussed, a possible pause gradient is hypothesized (increasing total pause time may lead to perceptions of increasing self-disclosure), and further research is recommended. (21 ref)—*Journal abstract*.

11788. Goepfert, S. [A sketch of a university curriculum for specialization in psychoanalysis.] (Germ) *Zeitschrift für Psychotherapie und medizinische Psycholo-*

gie, 1974(Jan), Vol 24(1), 21-30.—Notes that a university curriculum leading to specialization in psychoanalysis does not exist in West Germany even though student interest in psychoanalysis is increasing. Postgraduate training programs for psychoanalysis in the US and recently in West Germany give rise to questions about curriculum. Postgraduate psychoanalysis programs which stress clinical therapeutic aspects involve 2 dangers: (a) Too little attention will be paid to the development of psychoanalytic theories. (b) Public discussion of self-understanding and of the relationship between psychoanalysis and society will be avoided. A tentative curriculum for psychoanalysis training is offered for criticism.—*S. D. Babcock.*

11789. Halleck, Seymour L. (U North Carolina) **A troubled view of current trends in forensic psychiatry.** *Journal of Psychiatry & Law*, 1974(Sum), Vol 2(2), 135-157.—Discusses the increased involvement of psychiatrists in the resolution of social conflicts. It is suggested that while psychiatrists can sometimes help the courts make more informed decisions, there is reason to question whether much of current psychiatric involvement in legal issues serves a useful social purpose. The validity of attacks on certain psychiatric practices and the potential long-term effects on the treatment of patients are also discussed.—*Journal abstract.*

11790. Halliday, Gordon W. (U Kansas) **Reference time depth and duplications in doctoral dissertations in psychology.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 112.

11791. Heikkinen, Charles A. & German, Steven C. (Yale U, Medical School, Physician's Assoc Program) **Change of counselor attitudes: Complications due to closed-mindedness.** *Journal of Counseling Psychology*, 1975(Mar), Vol 22(2), 170-172.—In line with C. G. Kemp's (see PA, Vol 37:6922) study, the present study examined the possibility that closed-mindedness as measured by the Rokeach Dogmatism Scale, Form E, may interfere with attitude-change findings in counselor education. Ss were 16 practicum and 16 control group students enrolled in a master's level counselor education program. Although results are not statistically significant, trends in the data conform closely enough to those of Kemp to raise the possibility that previous findings of counselor attitude change may be subject to reinterpretation once the distorting influence of conformism due to closed-mindedness is taken into consideration. Further research is recommended with larger and more representative samples.—*Journal abstract.*

11792. Hes, Jozef Ph. (Hebrew U, Jerusalem, Israel) **The changing social role of the Yemenite Mori.** In A. Kiev (Ed), *Magic, faith, and healing: Studies in primitive psychiatry today*. New York, NY: Free Press, 1974. xvii, 475 p. \$2.95.

11793. Hummel, Thomas J.; Lichtenberg, James W. & Shaffer, Warren F. (U Minnesota, Education Career Development Office, Minneapolis) **CLIENT 1: A computer program which simulates client behavior in an initial interview.** *Journal of Counseling Psychology*, 1975(Mar), Vol 22(2), 164-169.—Presents details of CLIENT 1 in which, through interaction with the counselor, a programmed client progresses toward the goal of verbalizing a specific problem statement. Client movement is a

function of the simulated variables: threat value of counselor and client statements, strength of the relationship, and an index of counselor competence. The simulation project is valuable as a means of training and evaluation in counselor education and in studying counselor cognitive processes. The program, written in FORTRAN IV, also provides an opportunity to test the sufficiency of an explicit set of theoretical constructs for explaining client behavior.—*Journal abstract.*

11794. Kaplan, Seymour R. et al. (Albert Einstein Coll of Medicine, Yeshiva U) **Teaching mental health administration to psychiatric residents and fellows: A progress report.** *Administration in Mental Health*, 1972(Win), 30-39.—Describes how to recruit, where to train, and what to teach in a curriculum for administrative psychiatry and mental health administration. (25 ref)

11795. Lally, John J. & Barber, Bernard. (Lehman Coll, City U New York) **"The compassionate physician": Frequency and social determinants of physician-investigator concern for human subjects.** *Social Forces*, 1974(Dec), Vol 53(2), 289-296.—Medical authorities have commented that the "compassion" of the physician-investigator for human Ss, together with his professional expertise and other individual qualifications, is more important than, and preferable to social controls, for the protection of Ss' rights and welfare. Data from interviews with 337 research physicians were used to study the concept, "compassion," and permit estimation of the frequency of general concern for human Ss among physician-investigators and their specific concern for the actual Ss of their own investigations. Some research-related social conditions which tend to engender or activate this concern are specified. Findings of earlier studies, which can lead to an unwarranted conclusion that virtually all research physicians are deeply concerned and involved with their Ss, are thus qualified. Data indicate that physician-investigator "compassion" for Ss is far from universal. The need for social controls, such as peer review, is reaffirmed. (23 ref)—*Journal abstract.*

11796. Lennard, Henry L.; Bernstein, Arnold & Epstein, Leon J. (U California, Family Study Station, San Francisco) **The psychotherapist as a double agent.** *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 419-422.—Discusses the extent to which a mental health professional's actions are determined by himself and the extent to which they are determined by the organization in which he acts. The therapist is viewed as an agent of the social system, the legal system, the medical system, and the hospital. Conflicts between personal values and career goals, and the treating of a patient's problem without regarding his/her social circumstances, are considered. The often crippling impact of a therapist's attention being directed to a theoretical model instead of focusing on what is actually going on with the patient is noted. The therapist is encouraged to first demystify the situation in which he practices before treating a client's problems.—*R. Tomasko.*

11797. Levinson, Daniel J. & Klerman, Gerald L. (Yale U) **The clinician-executive revisited.** *Administration in Mental Health*, 1972(Win), 64-67.—Discusses a reprinted 1967 paper by the authors (see PA, Vol 41:13723) on the problems of the mental health clinician

serving in an executive capacity and examines its relevance in 1972. All of the points made in the original paper are considered to be still valid, but even stronger emphasis is now placed on the need of the clinician-executive to be trained for managerial responsibilities. The concepts of power, external boundaries, and negotiation are particularly discussed.

11798. Maslin, Audrey & Davis, Jerry L. (Temple U) **Sex-role stereotyping as a factor in mental health standards among counselors-in-training.** *Journal of Counseling Psychology*, 1975(Mar), Vol 22(2), 87-91. —Examined the possibility of multiple standards of mental health due to sex-stereotypic expectations in 45 male and 45 female counselors-in-training. 22 Ss were doctoral students and 68 were in the master's program. On a shortened version of the Stereotype Questionnaire, female Ss held an approximately uniform standard for healthy males, females, and adults (sex unspecified); male Ss subscribed to this standard for healthy males and adults but held another, more stereotypically feminine standard for healthy females. Possible restrictive effects of a double standard upon female clients, the need for determining by research the prevalence and forms of sex-biased attitudes and behaviors among counselors, and ways of reducing sex biases through counselor training are discussed.—*Journal abstract*.

11799. Maxmen, Jerrold S. (Albert Einstein Coll of Medicine, Yeshiva U) **Forecasting and medical education.** *Journal of Medical Education*, 1975(Jan), Vol 50(1), 54-65.—Describes modern forecasting techniques and criteria to evaluate prognostic endeavors, including intuitive forecasting, consensus methods, cross-impact matrix methods, and trend extrapolation. Examples of how these "futures research" techniques can be applied to medical education are provided. (22 ref)

11800. Melnick, Rosalie R. **Counseling response as a function of method of problem presentation and type of problem.** *Journal of Counseling Psychology*, 1975(Mar), Vol 22(2), 108-112.—Investigated the effects of different methods of problem presentation and client problems on the counseling responses of 42 graduate students enrolled in counseling methods courses. Ss responded to client statements which involved both social-personal and vocational-educational concerns, and which were presented by typescript, videotape, and role-playing actors. Responses were rated for levels of empathy, respect, and genuineness, and for proportions of affective and exploratory responses. Analyses of variance and correlational procedures indicate that the method of problem presentation and type of problem had significant effects on counseling response, and that some predictable relationships existed. Implications for educators involved in the evaluation of counseling behaviors are discussed. (16 ref)—*Journal abstract*.

11803. Murray, Patricia. (Methodist Hosp, Brooklyn, NY) **Death education and its effect on the death anxiety level of nurses.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1250.—30 female nurses who participated in a 6-wk death education program were administered Templer's Death Anxiety Scale before, at the end of, and 4 wks after training. Death anxiety had decreased significantly during the 4th wk after but not during the 6 wks of the program.

11804. Naftulin, Donald H. & Andrew, Barbara J. (U Southern California, Medical School) **The effects of patient simulations on actors.** *Journal of Medical Education*, 1975(Jan), Vol 50(1), 87-89.—Medical histories, clinical interviews, and MMPI scores suggest that professional actors who have simulated patients for educational purposes demonstrate no greater physical or emotional consequences associated with their roles than professional actors who have not simulated patients.

11805. Nay, W. Robert & Kerkhoff, Thomas. (Virginia Commonwealth U) **Informational feedback in training behavioral coders.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1175-1181.—Used videotapes of children's behavior in a natural setting to train 24 undergraduates to use a coding system. Ss were randomly assigned to training under conditions of immediate feedback, delayed feedback, and no feedback. Analyses of Ss' responses to a criterion videotape following training showed that feedback was superior to no feedback. The superiority of immediate feedback to delayed feedback was shown in evaluating performance during training but not in comparing criterion responses after training.—*Journal abstract*.

11806. Patton, Kenneth. (U Maryland) **On cultural diversity.** *Journal of Community Psychology*, 1975(Jan), Vol 3(1), 22-25.—Describes efforts made by faculty and students in the clinical psychology training program at the University of Maryland that reflects their support of the cultural diversity of the community. In trying to remedy the evident lack of minority group students in this program, members are trying to get out into the community more often. In addition, the clinical area is seeking to be a more central part of community life. The meaning of the term "scientist-professional" is discussed. Relationships between graduate students and faculty members are explored with reference to parent-child models and transference. Specific feelings of black students are cited.—R. S. Albin.

11807. Perlstadt, Harry. (Michigan State U) **MCAT: A gate in admissions and internship placements.** *Journal of Medical Education*, 1975(Jan), Vol 50(1), 78-81.—Surveyed 78 medical schools to examine the relationship between the admissions process, school characteristics resulting from the admissions process, and the proportion of the school's seniors placed in rotating internships. Results indicate that 3 mechanisms control the admissions "gateway": residency regulations, tuition costs, and scores on the Medical College Admission Test.

11808. Peterson, Craig M. (VA Hosp, Palo Alto, CA) **An experimental study of the effects of training on the ability of nonprofessionals to modify the behavior of psychiatric patients.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 197-198.

11811. Resta, Giorgio. [The teaching of psychosomatic medicine with special reference to the main aspects of psychology.] (Ital) *Medicina Psicosomatica*, 1972(Apr), Vol 17(2), 113-123.—Charges that to define psychology as "the science of behavior" is inadequate. The different disciplines studying behavior must be precisely distinguished: the study of behavior within the physical and clinical environment (psychophysiology), the study of behavior in the normal human environment (social psychology), and the study of behavior in a pathological human environment and in the process of recovery (psychotherapy). Psychosomatic medicine must evaluate its relationship with each of these 3 psychological disciplines. (French & English summaries)—D. L. Araoz.

11812. Rieger, Norbert I. & Devries, Alcon G. **The need and some specific suggestions for a standardized training program for a new professional: The child mental health specialist.** *Child Care Quarterly*, 1974(Fal), Vol 3(3), 177-187.—Proposes a standard training program for a new child care professional to be called a child mental health specialist (CMHS). The CMHS would work with children and adolescents who have problems of varying severity, in a wide variety of settings. Skills to be possessed by the CMHS and 4 levels of competency and training, ranging from 1 yr to the MA level, are proposed. Specific objectives of training are enumerated. Practical training in a variety of child care settings is stressed and a core program of academic subjects is described.—J. H. Feldstein.

11813. Rocky Mountain Psychological Assn. **Proceedings of the forty-fourth annual meeting.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 111.

11814. Rusconi, S. [Human rapport in medicine.] (Ital) *Medicina Psicosomatica*, 1972(Apr), Vol 17(2), 135-144.—Stresses the importance of the doctor-patient relationship in view of the great incidence of psychosomatic symptoms. A theoretical-formative training is advocated, i.e., traditional teaching together with practical or formative training in psychological principles of communication and understanding. It is suggested that formative training is best carried on in self-awareness groups. (French & English summaries)—D. L. Araoz.

11815. Selfridge, Fred F. et al. (Valley Central Middle School, Montgomery, NY) **Sensitivity-oriented versus didactically oriented in-service counselor training.** *Journal of Counseling Psychology*, 1975(Mar), Vol 22(2), 156-159.—Compared the effectiveness of 2 different in-service training workshops for counselors. 18 male and 15 female secondary school counselors with a mean age of 37.3 yrs and mean counseling experience of 6.3 yrs served as Ss. 22 Ss were given a 16-hr Carkhuff-type

refresher in facilitative interpersonal process plus 8 hrs either of sensitivity experiences or traditional didactic learning. 11 volunteers whose schedules could not be accommodated served as controls. Pre-post criteria of relationship skill were assessed in actual and simulated interviews. Results demonstrate the usefulness of Carkhuff-based training supplemented by group encounter as a professional-skills enhancer, and underscored the transferability of sensitivity training gains to counseling. It is concluded that the interpersonal learning that occurs in a sensitivity context may be a more valuable resource in real-life counseling situations than the learning effected by didactic materials. (17 ref)—*Journal abstract*.

11819. Southern Society for Philosophy and Psychology. **Proceedings of the sixty-sixth annual meeting.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 110.

11820. Southwestern Psychological Assn. **Proceedings of the twenty-first annual meeting.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 111.

11821. Valko, Robert J. & Clayton, Paula J. (Washington U, Medical School) **Depression in the internship.** *Diseases of the Nervous System*, 1975(Jan), Vol 36(1), 26-29.—Conducted structured psychiatric interviews with 53 1st-yr residents to investigate depression and suicidal thoughts during the internship year. 30% of the residents experienced depressions during this time, the majority occurring during the initial months of the internship. Comparisons between depressed and nondepressed groups indicate that more depressed interns had suicidal thoughts, marital problems, previous depressions, and positive family psychiatric histories. There was a high correlation between long working hours and depression. The cause of the depression symptom complex is discussed in terms of a predisposition to depression and reaction to stress. It is suggested that changes in the internship be considered.—F. L. Beyer.

11822. Wehmer, Gerald; Cooke, Gerald & Gruber, John. (Harbor Light Alcohol Treatment Ctr, Detroit, MI) **Evaluation of the effects of training of paraprofessionals in the treatment of alcoholism: A pilot study.** *British Journal of Addiction*, 1974(Mar), Vol 69(1), 25-31.—Describes a pilot program for training paraprofessionals in the treatment of alcoholism. Ss were respondents

to a notice of the availability of training, which was conducted 4 days/mo for 5 mo by members of the Salvation Army Harbor Light Alcoholism Treatment Center and consultants from Wayne State University, Detroit. Demographic and background data regarding the Ss were obtained, and several questionnaires were administered pre- and posttest and during training. Training was followed 1 yr later by a standardized telephone interview to determine the effect of the program on the trainee's work. The statistical treatment of the data is described. Hypotheses were that (a) training would produce a positive change in attitude toward alcoholism and (b) information about alcoholism would increase. Tentative conclusions support the 1st hypothesis but not the 2nd. An important effect was that the trainees' therapeutic technique changed from directive to nondirective. Overall, the program enabled trainees to use a wider range of techniques to progress to higher-level jobs. (15 ref)—A. P. Balvère.

11823. Weitz, Lawrence J.; Anchor, Kenneth N.; Benefee, Lee & Sandler, Howard M. (George Peabody Coll for Teachers) **Professional preparedness, identity status, and graduate training in the counseling professions: A survey.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 132-133.

## PHYSICAL AND PSYCHOLOGICAL DISORDERS

11826. Alley, Gordon R.; Snider, Bill; Forsyth, Robert A. & Optiz, Erica. (U Kansas) **Comparative parental MMPI protocols of children evaluated at a child development clinic.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1147-1154.—144 pairs of parents completed an MMPI upon evaluation of their children at a clinic before diagnosis. Parents were divided into 3 groups according to the diagnostic classification of the child: (a) minimal cerebral dysfunction, (b) behavior disorder, and (c) normal child. Separate multivariate analyses, computed for the groups by comparing the mean MMPI scores on the validity scales and the clinical scales for fathers and mothers, showed no significant differences in MMPIs of fathers on the validity scales. Also, no difference appeared on the 3 sex-determined analyses of the clinical scales. However, significant differences were found when scores for both the mothers alone and the combined fathers and mothers were analyzed across the

validity scales. The mothers of children with behavior disorders produced lower K scores (test-taking attitude). It is concluded that, while these parents could not be differentiated on the basis of clinical scales of the MMPI, they could be on the test-taking attitude of the mothers of those children evidencing behavior disorders.—*Journal abstract.*

11827. Brekke, Beverly W. & Williams, John D. (U North Dakota) **Educational disability and conservation.** In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.

11828. Green, Richard. (State U New York, Stony Brook) **The behaviorally feminine male child: Pretranssexual? Pretransvestic? Prehomosexual? Preheterosexual?** In R. C. Friedman, R. M. Richart, R. L. Vande Wiele & L. O. Stern (Eds), *Sex differences in behavior*. New York, NY: John Wiley & Sons, 1974. xvi, 495 p.

11829. Heiman, Elliott M. & Cao Van Lê. (U Arizona) **Transsexualism in Vietnam.** *Archives of Sexual Behavior*, 1975(Jan), Vol 4(1), 89-95.—Reports the case of a man raised in the Vietnamese peasant countryside who clearly fits the transsexual syndrome. On physical examination he appeared to be a normal male, yet he insists that he is a female. He dresses as a woman and is able to successfully "pass" in society. He relates that he felt he was a female from earliest childhood. He prefers nonhomosexual men, denies any heterosexual experience, and has an all-consuming desire for the sexual transformation operation. The social aspect of transsexualism and the manner in which a society, particularly the Vietnamese, may handle transsexual behavior is discussed. A case of a female transsexual is also briefly reported. (18 ref)—*Journal abstract.*

11830. Hoffmann, Norman G. & Butcher, James N. (U Minnesota) **Clinical limitations of three Minnesota Multiphasic Personality Inventory short forms.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 32-39.—Compared 3 MMPI short forms, the Mini-Mult, T. Faschingbauer's 166, and the MMPI-168, which were constructed by different methodologies, using 1,028 male psychiatric patients as Ss. Although the short-to standard-form correlations for all 3 short forms were generally high (ranging from .74 to .96 for the MMPI scales), the success in accurately predicting the code type was quite low. The hit rates in predicting the 58 code types used in the study were 36.7% for the Mini-Mult, 40.4% for the MMPI-168, and 49.4% for Faschingbauer's 166 form. An analysis of false positive and false negative test misses showed further weaknesses in MMPI short forms. Results question the use of MMPI short forms for clinical interpretation based on usual profile interpretation procedures (code-type analysis). (25 ref)—*Journal abstract.*

11831. Mikulec, A. & Rajsiglová, E. (Neurologické oddělení psychiatrické léčebny, Kroměříž, Czechoslovakia) **[Importance of echoencephalography for psychiatry.]** (Czec) *Československá Psychiatrie*, 1973(Jun), Vol 69(3), 170-179.—Describes echoencephalography as a time-saving and undemanding diagnostic tool. It helps differential diagnosis to reveal expansive processes in

pseudoneurasthenias and psycho-organic syndromes, and to identify hydrocephalic ventricular changes in some psychotic states. Several echograms are presented and explained. (Russian & English summaries) (40 ref) —V. Fischmann.

11832. Money, John. (Johns Hopkins U, School of Medicine & Hosp) **Ablatio penis: Normal male infant sex-reassigned as a girl.** *Archives of Sexual Behavior*, 1975(Jan), Vol 4(1), 65-71.—Reports 45 cases of genetic males who were assigned and habituated as females, 43 because of a congenitally defective penis (micropenis with or without hypospadias), and 2 because of infantile ablatio penis. One of the latter has an identical twin brother as a control. Now 9 yrs old, she has differentiated a female gender identity in marked contrast to the male gender identity of her brother. Some of the other patients are now adolescent or adult in age. They demonstrate that the twin can expect to be feminine in erotic expression and sexual life. Maintained on estrogen therapy, she will have normal feminine physique and a sexually attractive appearance. She will be able to establish motherhood by adoption.—*Journal abstract.*

11833. Rassidakis, N. C.; Erotocritou, A. & Volidou, M. (U Athens, Greece) **The study of the etiology and pathogenesis of schizophrenia, the psychosomatic illnesses, diabetes mellitus and cancer.** *International Mental Health Research Newsletter*, 1973(Win), Vol 15(4), 14-16.—Presents the argument based on the findings of others and on personal work and observations that schizophrenia, the psychosomatic illnesses, diabetes mellitus, and cancer are all psychosomatic transformations of nuclear anxiety, and that these diseases all fall on the illness continuum first described by C. B. Bahnson (1969). Evidence mustered in support of the argument includes (a) the frequent appearance of these diseases around adolescence and the involutional periods; (b) the disappearance of anxiety once the disease is established; (c) the existence of carcinogenic, schizophrenogenic, and diabetogenic agents; and (d) the basic incurability of all these illnesses.—C. A. Heikkinen.

11834. Rorsman, B. (Lund U, Inst of Psychiatry, Sweden) **Mortality among psychiatric patients.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(3), 354-375.—A study of mortality over a 6-yr span among patients seen during 1962 in the psychiatric department of a Swedish hospital revealed 260 deaths compared to 159 expected deaths in a corresponding general population sample. To determine high-risk groups within the psychiatric population, the patients who died were compared with a random sample of psychiatric patients still alive at the end of the observation time, on social and medical factors previously found to be related to mortality. Divorced persons were more common among those who died than among controls, and more males who died were living alone, alcoholics, unemployed, or invalid pensioners. The one outstanding psychiatric diagnosis among those who died was organic brain syndrome. More than 50% of the patients who committed suicide had previously attempted suicide. A high proportion of those who died were hospitalized in somatic wards and sent to the psychiatric outpatient department for psychiatric assessment. Common reasons for referral

were recently attempted suicide and pain, often of unknown origin. (50 ref)—*Journal abstract.*

11835. Shoham, S. Giora. (U Tel-Aviv, Law Faculty, Criminology Inst, Israel) **Society and the absurd.** New York, NY: Springer, 1974. xvii, 214 p. \$9.50.—Approaches "the absurd" from a sociological point of view and uses the concept as the basis for discussing various social themes, including social deviance, alienation, and madness. The relation of the absurd to the concept of norms and normative behavior is also considered. (12 p ref)

11836. Stever, Larry et al. (Stanford U, Medical School) **Gradients of biogenic amine metabolites in cerebrospinal fluid.** *Diseases of the Nervous System*, 1975(Jan), Vol 36(1), 13-16.—Assayed the concentrations of 5 hydroxyindoleacetic acid and homovanillic acid in the lumbar cerebrospinal fluid of 6 neurological and psychiatric patients in either sitting, lying, or after somersaulting positions. Patients tapped in the sitting position were shown to have a clear concentration gradient of acid metabolites in the spinal cord, which was not seen in patients tapped in the lying position or after somersaulting. The appropriateness of using cerebrospinal fluid metabolite concentrations as indexes of central nervous system metabolism is discussed. (42 ref) —F. L. Beyer.

11837. Stine, Oscar C.; Pacanowski, John P.; Roffman, Ruth V. & Heald, Felix P. **Two health questionnaires for adolescents.** *Journal of School Health*, 1974(Mar), Vol 44(3), 136-139.—Compared the sensitivity of a short and long health questionnaire to a physician's diagnosis in identifying problem areas in adolescents. Specific strengths and weaknesses in each form's ability to communicate between adolescent and physician are discussed in detail.

### Mental Disorders

11838. Fields, Francis R. & Fullerton, John R. (VA Hosp, Lebanon, PA) **Influence of heroin addiction of neuropsychological functioning.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 114.—Compared performance of 25 heroin-addicted veterans, 25 brain-damaged veterans, and 25 normal controls on the Halstead Impairment Index. All subtests significantly discriminated between the brain-damaged group and the heroin-addicted and normal groups, but there were no significant differences between the latter 2 groups.

11839. ———. **Identifying schizophrenia on worldwide basis.** *Health Services Reports*, 1973(Dec), Vol 88(10), 975-976.—Announces release by the World Health Organization of Vol 1 of an International Pilot Study of Schizophrenia, the result of a 10-yr research project that investigated 1,202 patients in 9 countries. The study proved that international collaboration is feasible, that research procedures for international use can be developed, and that similar types of schizophrenia could be found in the 9 countries.

11840. Allodi, F. A. (Clarke Inst of Psychiatry, Toronto, Ontario, Canada) **Accident neurosis: Whatever happened to male hysteria?** *Canadian Psychiatric Association Journal*, 1974(Jun), Vol 19(3), 291-296.—Reports on 50 patients referred by the Workmen's Compensation Board for psychiatric evaluation, after disabling acci-

dents. Little evidence was found that the patients had had psychiatric problems before their accidents. Symptoms were mainly hysterical (conversion reactions). The patients did not respond to treatment; the question of their right to compensation had not yet been settled, which may have caused secondary gain. Suggestions are offered for planning further research on accident neurosis. (French summary) (23 ref)—*F. Auld*.

11841. **Andreasen, N. J. & Powers, Pauline S.** (U Iowa, Medical School) **Overinclusive thinking in mania and schizophrenia.** *British Journal of Psychiatry*, 1974(Nov), Vol 125, 452-456.—Evaluated 16 manics, 15 schizophrenics, and 15 normal controls using R. Payne's (see PA, Vol 37:3228) battery of tests for overinclusive thinking. The manics showed significantly more overinclusive thinking than the schizophrenics on 2 out of 3 tests in the battery and on total transformed score. Schizophrenics were underinclusive when compared with normal controls, and manics were overinclusive. These data suggest that overinclusiveness is not specific to schizophrenia and that it is associated with illnesses which remit or have a good prognosis. (19 ref)—*Journal summary*.

11842. **Antonelli, Ferruccio & Ancona, Leonardo.** (Catholic U, School of Psychiatry, Rome, Italy) **[Methodology in psychosomatic research.]** (Ital) *Medicina Psicosomatica*, 1972(Apr), Vol 17(2), 103-111.—Because the psychosomatic process affects the individual in every aspect of his existence—social, mental and biological—it is difficult to outline methodology appropriate to psychosomatic research. It is suggested that it would be more useful to differentiate methods according to possible research directions: etiology, pathogenesis, diagnosis, or therapy. (English & French summaries) (27 ref)

11843. **Aronow, Edward; Reznikoff, Marvin & Tryon, Warren W.** (Fordham U) **The interpersonal distance of process and reactive schizophrenics.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 94.—Attempted to determine whether process and reactive schizophrenic males would use their interpersonal space differently from each other and from a normal control group. Data from 4 measures of interpersonal distance do not indicate that process schizophrenics were more interpersonally distant than reactive schizophrenics or normals, but suggest that the hypothesized differences in social adequacy between process and reactive patients and normals were not reflected in their use of interpersonal distance.

11844. **Berg, Ian & Collins, Tony.** (Scalegor Park Hosp, High Lands Adolescent Unit, Burley-in-Wharfedale, England) **Willfulness in school-phobic adolescents.** *British Journal of Psychiatry*, 1974(Nov), Vol 125, 468-469.—Conducted a study with 43 school-phobic and 37 non-school-phobic Ss admitted to an adolescent inpatient unit to determine the amount of oppositional behavior shown by the Ss in the family setting. Ss were administered a 12-question rating scale designed to measure this behavior. No sex, age, social class, or school differences emerged from 1-way analyses of variance on the 1st 5 factor scores on the questionnaire. When comparisons were made between the 24 acute school phobics, the 19 chronic school phobics, the 12 Ss with

conduct disorders, and the 25 with other problems, it was found that Ss with conduct disorders were significantly more resistive. Results do not support the view that school-phobic children are unduly willful toward their parents, as compared to other psychiatric cases.—*Journal summary*.

11845. **Berg, Ian; Butler, Alan & Pritchard, Janice.** (Scalegor Park Hosp, High Lands Adolescent Unit, Burley-in-Wharfedale, England) **Psychiatric illness in the mothers of school-phobic adolescents.** *British Journal of Psychiatry*, 1974(Nov), Vol 125, 466-467.—Investigated maternal psychiatric illness in 100 school-phobic and 113 non-school-phobic children admitted to an adolescent unit. Results indicate that approximately 20% of the parents had a history of psychiatric disorder in both groups. Over 50% of the affected mothers in each group had suffered from an affective disorder. It was not possible to relate school phobia to the type of maternal mental illness.—*Journal summary*.

11846. **Campagna, Anthony F. & Harter, Susan.** (Whiting Forensic Inst, Middletown, CT) **Moral judgment in sociopathic and normal children.** *Journal of Personality & Social Psychology*, 1975(Feb), Vol 31(2), 199-205.—A total of 44 mental age- and IQ-matched 10-13 yr old normal and sociopathic boys were administered L. Kohlberg's moral development interview and the WISC. Results reveal that level of moral reasoning was higher for normal than for sociopathic Ss at both mental age levels. Within each group, high-mental-age Ss tended to have higher moral judgment scores than low-mental-age Ss, suggesting the presence of a general cognitive factor underlying moral development. The poorer performance of the sociopathic Ss was interpreted as supporting the formulation that sociopathy is related to an arrest in moral development. Discussion focuses on the relative lack of opportunities for role-taking and identification in the families of sociopathic children. (20 ref)—*Journal abstract*.

11847. **Chesno, Frank A. & Kilmann, Peter R.** **Societal labeling and mental illness.** *Journal of Community Psychology*, 1975(Jan), Vol 3(1), 49-52.—Studied the perceptions of mental illness among 52 male and female patients recently committed to a large state mental hospital. Their mean educational level was 9.8 yrs with a range from 3 to 16 yrs. 3 dependent measures were employed: (a) the Ego-strength Scale (F. Barron, 1953) as an index of health and adjustment, (b) the Critical Items Scale as an estimate of pathology, and (c) the determination made by staff concerning the patient's ability to cope with release from the hospital. Ss were seen within 12 hrs after arrival at the hospital. After completing the test items, 35 were randomly assigned to return to their wards. The remaining 17 were informed that although their test results did not reveal mental illness, they would have to remain for a 30-day observation period because of hospital regulations. This 2nd group showed a higher release rate than did the group labeled as mentally ill. Results are interpreted in terms of society's power to label and confirm mental illness.—*R. S. Albin*.

11848. **Clayton, Paula J.; Herjanic, Marijan; Murphy, George E. & Woodruff, Robert.** (Washington U, Medical School) **Mourning and depression: Their similarities and**

differences. *Canadian Psychiatric Association Journal*, 1974(Jun), Vol 19(3), 309-312.—Compared 34 randomly-selected persons whose spouses had died within a month previously with 34 psychiatric inpatients, matched on age and sex, diagnosed as having a primary affective disorder. The patients had more symptoms (average 15) than the grieving normals (average 7). However, there was so much overlapping of symptoms that the 2 groups cannot be differentiated by the symptoms they exhibited. For research purposes, it is recommended that people who are depressed after the death of a close relative should not be considered as suffering from primary affective disorder. (French summary)—*F. Auld*.

11849. Copeland, J. R. et al. (Inst of Psychiatry, London, England) **Diagnostic differences in psychogeriatric patients in London and New York: United Kingdom-United States diagnostic project.** *Canadian Psychiatric Association Journal*, 1974(Jun), Vol 19(3), 267-271.—Compares 50 patients 65 yrs old and older, consecutive admissions to 2 hospitals in New York City, with 50 similar consecutive admissions to 4 hospitals in London. A project team of psychiatrists diagnosed all patients, with satisfactory reliability. Although the New York psychiatrists called more of their patients "organic" than London psychiatrists did, the project diagnosticians did not find any marked difference between the New York and London patients. (French summary)—*F. Auld*.

11850. Costello, C. G.; Christensen, S. J. & Rogers, T. B. (U Calgary, Alberta, Canada) **The relationships between measures of general depression and the endogenous versus reactive classification.** *Canadian Psychiatric Association Journal*, 1974(Jun), Vol 19(3), 259-265.—Tested 95 patients, mostly consecutive admissions to the psychiatric unit of a general hospital, using the Pilowsky Questionnaire and 4 self-report measures of general depression. The measures of depression correlated strongly (average  $r = .72$ ) with the Pilowsky measures of endogenous and reactive depression; but these scales correlated weakly (average  $r = .33$ ) with the Pilowsky classification score, which is intended to discriminate endogenous from reactive depression. It is concluded that H. J. Eysenck's assumption that there is a sharp, binary distinction between endogenous and reactive depression is wrong. (French summary)—*F. Auld*.

11851. Crisp, A. H. & Kalucy, R. S. (U London, England) **Aspects of the perceptual disorder in anorexia nervosa.** *British Journal of Medical Psychology*, 1974(Dec), Vol 47(4), 349-361.—Conducted 2 studies with a total of 10 female anorexia nervosa patients and 6 female hospital staff with normal and stable weight to investigate some of the factors contributing to anorexia nervosa. Ss' reported overestimates of their body widths. Results show that (a) in both studies, the anorexia nervosa patients' initial self-reports of body widths were in the same direction and of the same magnitude as those reported by P. Slade and G. Russell (see PA, Vol 51:9223); (b) the younger "normal" Ss exaggerated their body size almost as much as the anorexia nervosa patients; and (c) the anorexia nervosa patients who did well still overestimated their body widths by about 10% after recovery. (24 ref)—*M. E. Pounsel*.

11852. Davids, Anthony. (Brown U) **Effects of human and nonhuman stimuli on attention and learning in psychotic children.** *Child Psychiatry & Human Development*, 1974(Win), Vol 5(2), 108-116.—Explored the effect of human stimuli on the performance of psychotic children in a visual fixation experiment and a simple discrimination learning task. In a comparison of psychotic, younger normal, and older normal boys (5 in each group), the psychotics showed attentional deficits ( $p < .05$ ), but they were not influenced by the social vs nonsocial nature of the stimuli. The psychotic children showed improvement under conditions of positive reward for correct performance ( $p < .05$ ).—*Journal abstract*.

11853. Delany, Frances I. & FitzPatrick, Mary M. (League School, Brooklyn, NY) **The use of conservation-type tasks with seriously disturbed, non-institutionalized children.** In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.

11854. Elsnitz, Alan J. (State U New York, Downstate Medical Ctr, Psychoanalytic Inst, Brooklyn) **On the metapsychology of narcissistic pathology.** *Journal of the American Psychoanalytic Association*, 1974, Vol 22(2), 279-291.—Discusses modification of Freud's concepts of (a) object choice, wherein the major cathexis is directed to the self representation and (b) attachment object choice, wherein the major cathexis is directed to the object representation. The major advantages of the modification are presented. From this frame of reference narcissistic conflict, narcissistic defenses, and narcissistic pathology are discussed. Some clinical examples are given.—*D. R. Marino*.

11855. El-Gaaly, A. A. (Queen Street Mental Health Ctr, Toronto, Ontario, Canada) **Social dysfunction in depressives and attempted suicides.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(3), 341-345.—Used the Depression Rating Scale of M. Hamilton and the Social Dysfunction Rating Scale of M. W. Linn et al to compare 17 female depressed patients who did not attempt suicide with 21 female depressed patients who attempted suicide. The 2 groups were comparable in social class and marital status. The suicidal group was younger. Results show no significant difference between the 2 groups in the degree of severity of depression, but there was a significant difference in the degree of social dysfunction: the suicidal younger group showed more dysfunction.—*Journal abstract*.

11856. Fast, Irene. (U Michigan) **Multiple identities in borderline personality organization.** *British Journal of Medical Psychology*, 1974(Dec), Vol 47(4), 291-300.—Discusses the multiplicity of identities as a particular characteristic of borderline personality organization. These identity characteristics are conceptualized as stemming from the period in development in which the infant is making the transition from narcissism to a commitment to objective reality. Object relations show characteristics of the separation-individuation phase—a movement beyond symbiosis, but a continuing heavy dependence on the other person's confirming reaction

for a continuing sense of identity. It is suggested that, depending on other personality developments, these characteristics may occur in a wide range of age and pathology. (21 ref)—*Journal summary*.

11857. Finch, A. J.; Deardorff, P. A. & Montgomery, L. E. **Reflection-impulsivity: Reliability of the Matching Familiar Figures Test with emotionally disturbed children.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1133-1134.—Administered the Matching Familiar Figures Test to 30 emotionally disturbed children (mean age = 11 yrs) at the beginning and end of a 3-mo period. Neither latencies nor errors were reliable.

11858. Finch, A. J.; Nelson, W. M.; Montgomery, L. E. & Stein, A. B. (Virginia Treatment Ctr for Children, Richmond) **Reflection-impulsivity and locus of control in emotionally disturbed children.** *Journal of Genetic Psychology*, 1974(Dec), Vol 125(2), 273-275.—Conducted a study of 10 reflective and 10 impulsive emotionally disturbed boys (as determined by scores on the Matching Familiar Figures Test) to investigate the relationship between the cognitive dimension of reflection-impulsivity and locus of control. It was hypothesized that reflective Ss would be more internal in their locus of control than impulsive ones. Findings indicate that there was no difference between Ss employing an impulsive and a reflective cognitive style on the Nowicki-Strickland Locus of Control Scale for Children.—*M. E. Pounsel*.

11859. Fleischer, J.; Kolibás, E. & Žucha, I. (U Komenského, Bratislava, Czechoslovakia) **[Problems of multifactorial genesis of mental disorders.]** (Slovak) *Československá Psychiatrie*, 1973(Jun), Vol 69(3), 153-158.—Theorizes about the multifactor etiology of endogenous psychoses and examines the relative importance of the endogenous, reactive, and semantic factors in their pathogenesis. It is concluded that when the involvement of the endogenous factor decreases, the importance of the other 2 factors increases, the course of the illness becomes more complicated and its symptomatology more variable, and a more differentiated use of pharmacotherapy is then appropriate and necessary. Graphic schemes are presented in which the position of each type of psychosis is determined by the relative pathogenic importance of the 3 factors. (Russian & English summaries) (17 ref)—*V. Fischmann*.

11860. Fleiss, Joseph L.; Gurland, Barry J. & Goldberg, Kenneth. (New York State Dept of Mental Hygiene, Biometrics Research, New York) **Independence of depersonalization-derealization.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 110-111.—Used data from structured mental state interviews given to 866 psychiatric inpatients to investigate the hypothesized independence of the depersonalization-derealization syndrome from diagnosis and other factors of psychopathology. Results support the hypothesized relation, and confirm previous findings that depersonalization and derealization are nonspecific to other behaviors, are not related to sex, and decrease with age.

11861. Gandini, G. **[Psychosomatic aspects of the cephalalgic syndrome.]** (Ital) *Medicina Psicosomatica*, 1972(Apr), Vol 17(2), 153-157.—Estimates that over 30% of all headaches are psychosomatic. Diagnosis is based

on the absence of organic alterations and on the presence of a real psychoaffective imbalance. Administration of psychomedication is indicated, but psychotherapy must accompany any chemotherapy for the latter to be effective and lasting. (French & English summaries)—*D. L. Araoz*.

11862. Gelfand, Michael. (University Coll Rhodesia, Salisbury) **Psychiatric disorders as recognized by the Shona.** In A. Kiev (Ed), *Magic, faith, and healing: Studies in primitive psychiatry today*. New York, NY: Free Press, 1974, xvii, 475 p. \$2.95.

11863. Ginath, Yigal. (Talbieh Psychiatric Hosp, Jerusalem, Israel) **Psychoses in males in relation to their wives' pregnancy and childbirth.** *Israel Annals of Psychiatry & Related Disciplines*, 1974(Sep), Vol 12(3), 227-237.—Describes the normal psychic reaction of the male to the pregnancy and childbirth of his wife, subscribing to the opinion that normally these processes form an important step in the mental development of the male. The many ramifications of these events are surveyed. Against this background an attempt is made to survey the psychic difficulties aroused under these circumstances in the male (e.g., envy of the woman for her capability to become pregnant and give birth, enmity feelings and rivalry toward the fetus or the baby, and inclination towards regression). Psychic difficulties generally revive the unsolved childhood conflicts of those fathers. The possible psychopathological reactions in the male in this condition are described, including psychoses in connection with pregnancy and childbirth. 2 patients in whom a psychosis developed after the 1st childbirth of their wives are described. In both cases the condition was re-exacerbated after further pregnancies and childbirths.—*Journal abstract*.

11864. Glatzel, J. (Johannes-Gutenberg-U, Neuro-Psychiatrische Klinik, Mainz, W Germany) **[Psychopathological aspects of cyclothymic depressive courses.]** (Germ) *Psychiatria Clinica*, 1974, Vol 7(2), 120-128.—Only some of the main symptoms of cyclothymic depression can be considered as autochthonic. The syndrome which usually constitutes the clinical picture of cyclothymia, and determines its transformation in the course of time, is the result of the patient's coping patterns with the impairments caused by the illness and the modifications of the expectations of those with whom they interact. At the beginning, both sides try to keep the behavioral nonconformity below the level of social perception. Later on, the environment reacts to the behavioral disorder of the patient, branding him as mentally ill, and finally, the patient finds in his depressive delusions a new pseudo-identity, which allows him through his delusionally newly adopted role to create new interactional relationships and, in this way, to achieve a partial comeback to social life. (18 ref)—*English summary*.

11865. Golding, Stephen L.; Becker, Ellen; Sherman, Scott & Rappaport, Julian. (U Illinois) **The Behavioral Expectations Scale: Assessment of expectations for interaction with the mentally ill.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 109.—Describes the development and evaluation of a behaviorally specific expectation scale to facilitate investigations of behavior-expectation effects in social interactions with

the mentally ill. Data indicate that the 21-item true-false scale may be useful in further studies of the role of expectation in attitudes toward the behavior of persons labeled "mentally ill."

11866. Halonen, P. E.; Rimon, R.; Arohonka, Katve & Jäntti, V. (U Turku, Finland) **Antibody levels to herpes simplex type I, measles and rubella viruses in psychiatric patients.** *British Journal of Psychiatry*, 1974(Nov), Vol 125, 461-465. Serum specimens from 318 psychiatric patients and 32 healthy medical personnel (controls) were collected for herpes simplex Type I virus plaque neutralization test, measles hemagglutination inhibition test, and rubella hemagglutination inhibition test. The *k*-values of herpes simplex Type I antibody were significantly higher in 56 patients with psychotic depression than in 32 controls, and 27% of the patients with depression had higher antibody values than the highest value in the controls. In 54 patients with schizophrenia and in 32 patients with other psychiatric diseases, the *k*-values of herpes simplex Type I antibody were also significantly higher than in the controls, but the difference was not as marked as in the patients with psychotic depression. The mean rubella antibody titres were not significantly higher in the patients with psychotic depression than in the controls, whereas the mean measles hemagglutination inhibition titres were lower in each psychiatric group tested than in the controls. (15 ref)—*Journal summary*.

11867. Harper, Juliet. (New South Wales Coll of Paramedical Studies, Sydney, Australia) **Infantile autism: Subclassification on the basis of neurological impairment.** *Australian Journal of Mental Retardation*, 1974(Jun), Vol 3(2), 49-55.—Reviewed case history data on 131 autistic children (mean age = 10.8 yrs) to test the proposition that subclassification based on the presence or absence of positive neurological findings is of prognostic value. Results indicate that this measure was of limited use in defining subclusters of the epidemiological data included in the research. However, it did suggest that reproductive complications were a frequent variable in the etiological histories of the organic group and that environmental stresses were associated with the non-organic group. With respect to follow-up on intellectual functioning and language development, evidence of neurological impairment had no predictive significance. (21 ref)—*Journal abstract*.

11868. Herzog, Alfred & Detre, Thomas. (Hartford Hosp, CT) **Postpartum psychoses.** *Diseases of the Nervous System*, 1974(Dec), Vol 35(12), 556-559.—Present a follow-up of 13 cases selected from admissions to the Yale-New Haven Hospital Psychiatric Unit between April 1960 and April 1963. Follow-up letters were sent to all 13 patients who were interviewed either in person or by telephone. The interval since hospitalization ranged from 6 mo to 12 yrs. All patients were married and came from a middle-class background. The average age was 28.6 yrs. 3 patients were diagnosed as having a schizophrenic episode, 5 as having a unipolar depression, and another 5 as having manic-depressive states. Patients with rapidly alternating manic-depressive states are discussed in detail. The correlation of these mood states with the multiple and rapid hormonal changes occurring postpartum is discussed. These patients re-

sponded uniformly and well to electroconvulsive treatment. (24 ref)—R. S. Albin.

11869. Hoenig, J. (Memorial U Newfoundland, St John's, Canada) **The schizophrenic patient at home.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(3), 297-308.—Conducted a 4-yr follow-up study to assess the progress of 120 schizophrenic patients, all 1st admissions to 4 different psychiatric units. The patients were managed largely extramurally and lived mostly at home. They spent little time in the hospital, but only a few of them remained symptom-free throughout the follow-up period. Many patients were able to work. The effect the patient had on the household was considerable in terms of loss of earnings, separations from children, and frequent disturbing behavior. Nevertheless, many families were able to endure this without complaining, especially if the psychiatric services were part of a general rather than a mental hospital.—*Journal abstract*.

11870. Houlihan, John P. (Malcom Grow Medical Ctr, Andrews Air Force Base, Camp Springs, MD) **Visual word recognition and autonomic responsivity of schizophrenic patients.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 195.

11871. Hullin, R. P. et al. **Urinary cyclic AMP in the switch process from depression to mania.** *British Journal of Psychiatry*, 1974(Nov), Vol 125, 457-458.—Results of a study of a 42-yr-old manic-depressive female indicate that variations of urinary excretion of adenosine cyclic 3' 5' monophosphate (cyclic AMP) were not always related to mood. The transient increase of urinary cyclic AMP excretion associated with a rapid change from depression to mania found by M. Paul et al (see PA, Vol 46:7189), did not occur in the S. Calculation of the results in terms of  $\mu$ Moles cyclic AMP excreted per gram of creatinine also showed no correlation between cyclic AMP and mood.—*Journal summary*.

11872. Ingvar, D. H. & Franzén, G. (U Lund Hosp, Sweden) **Abnormalities of cerebral blood flow distribution in patients with chronic schizophrenia.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(4), 425-462.—Studied 11 younger (mean age = 25 yrs) and 9 older (mean age = 61 yrs) chronic schizophrenic inpatients. The younger patients were well preserved intellectually. All the older ones showed advanced deterioration with autism, bizarre behavior, symptoms of catatonia, and ongoing hallucinations. Regional cerebral blood flow (rCBF) was measured in the dominant hemisphere at rest and during attempts at mental activation. Both groups showed normal mean rCBF variables. In the older group, significant correlations were established between the mean hemisphere flow level and the degree of psychosis. The regional rCBF distribution was normal in the younger group, with a predominance of high flows in frontal regions. In the older patients, a hypofrontal pattern was found with relatively low flows frontally, and, in many cases, relatively high flows occipitally. Psychological testing with Raven's Progressive Matrices in the younger group gave normal flow augmentations within expected hemisphere regions. In the most autistic older patients, only very slight flow changes were recorded postcentrally in connection with a simple picture test. The hypofrontal rCBF distribution pattern found in older deteriorated schizophrenics

indicates that an abnormally low level of activity may prevail within the frontal lobe in such patients. Similarities between the emotional defects, speech, and motor abnormalities seen in chronic schizophrenia, and symptoms found in patients with frontal lobe lesions are pointed out. (71 ref)—*Journal abstract*.

11873. Jacobson, Shirley; Fasman, Jean & DiMascio, Alberto. (Boston State Hosp. Collaborative Depression Study, MA) **Deprivation in the childhood of depressed women.** *Journal of Nervous & Mental Disease*, 1975(Jan), Vol 160(1), 5-14.—Tested the hypothesis that childhood deprivation (i.e., the lack, loss, or absence of an emotionally sustaining relationship prior to adolescence) is associated with the occurrence of adult depression using data from 347 depressed inpatient women, 114 outpatient women, and 198 normal control women. All Ss were white and ranged in age from 18 to 60 yrs. Interviews were conducted with all Ss to document events occurring during childhood that could be considered within the definition of deprivation. Ss were also assessed as to depriving childrearing experiences. Findings indicate no association between adult depression and overt childhood loss events, but do provide evidence to support an association of depriving childrearing processes with adult depression. Evidence of a relationship between the degree of the depriving childrearing experience with the severity of the adult illness as measured by hospital status was also obtained. (26 ref)—*Journal abstract*.

11874. Jones, Gerald C. (Queen Street Mental Health Ctr. Toronto, Ontario, Canada) **Classification of mental illness: The value of certain French nosological concepts.** *Canadian Psychiatric Association Journal*, 1974(Jun), Vol 19(3), 273-277.—Argues that a reintroduction of the concepts of psychosis derived from French psychiatry would be of value in terms of clinical precision, research, and treatment. The relatively few diagnoses used in North America for psychoses other than depressive and organic are contrasted with the more extended French classification system. The demonstrated usefulness of the precise classification of depressive patients suggests that similar discrimination applied to other psychoses would be useful.—*Journal abstract*.

11875. Kinston, Warren & Rosser, Rachel. (Maudsley Hosp. London, England) **Disaster: Effects on mental and physical state.** *Journal of Psychosomatic Research*, 1974(Dec), Vol 18(6), 437-456.—Reviews the literature concerning phenomenological and dynamic descriptions of mental effects of disaster as observed in individuals and groups, and suggests its implications for the planning of services associated with disaster. Preventive and planning measures are discussed. (117 ref)—*W. G. Shipman*.

11876. Klerman, Gerald L. (Massachusetts General Hosp. Boston) **The broadening scope of research in depressive disorders.** *Journal of Nervous & Mental Disease*, 1975(Jan), Vol 160(1), 3-4.—Briefly examines some of the sources of the renewed interest in the study of depression and its treatment. The importance of integrating not only biological but also sociological and psychodynamic factors in the study of human affect is noted.

11877. LaTorre, Ronald A. (McGill U, Montreal, Quebec, Canada) **Gender and age as factors in the attitudes toward those stigmatized as mentally ill.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 97-98.—36 male and 72 female undergraduates read 2 case histories of either a male or female and young or old obsessive-compulsive patient or a schizophrenic patient. Ss' ratings of the patients on 5 rating scales support the proposition that males rate such patients as less ill and perceive less difficulty in getting along with them than females; however, they contradict the idea that female patients are considered less severely ill than a similarly described male patient. Age had no significant effects.

11878. Locke, Susan A. (Bernard M. Baruch Coll, City U New York) **Temporal discrimination of brief auditory stimuli by schizophrenics, neurologically impaired, and normals.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1111-1120.—Compared 36 normal, 36 schizophrenic, and 36 neurologically impaired male adults for their ability to temporally discriminate brief auditory stimuli. The experimental task was the absolute judgment of 3, 5, or 9 stimuli ranging in duration from .10 to 1.90 sec. Univariate and bivariate information analysis showed that normal Ss obtained significantly higher information transmission scores than did either brain-damaged or schizophrenic Ss. The 2 clinical populations failed to produce the classical information-transmission function of a linear increase up to channel capacity, then virtually no change thereafter. Normal Ss also demonstrated less response stereotypy than did the schizophrenic and neurologically impaired Ss. (39 ref)—*Journal abstract*.

11879. MacCrimmon, D. J.; Sigal, J. J. & Streiner, D. L. (McMaster U, Hamilton Psychiatric Hosp. Ontario, Canada) **Differential diagnosis of schizophrenic and nonschizophrenic adolescents by tests based on interference theory.** *Canadian Psychiatric Association Journal*, 1974(Jun), Vol 19(3), 279-285.—Uses interference theory as a basis for choosing psychological tests to detect schizophrenic deficit. 6 tests requiring selective attention in the face of competing stimuli were given to 9 nonschizophrenic and 12 schizophrenic adolescent psychiatric inpatients aged 14-20 yrs (10 males, 11 females), consecutive admissions to the hospital. Although differences between groups were in the predicted direction for all 6 tests, only the difference on V. Rakoff's Competing Voices Task (see PA, Vol 47:5257) was statistically significant. (French summary) (21 ref)—*F. Auld*.

11880. Marfatia, J. C. **Schizophrenia in childhood.** *Child Psychiatry Quarterly*, 1972(Oct), Vol 5(4), 1-7.

11881. Meyers, C.; Donnay, J.-M. & Dethienne, F. **[Analysis of the present neuropsychiatric pathology of former prisoners of war, with special reference to age at onset of captivity.]** (Fren) *Acta Psychiatrica Belgica*, 1974(Jan), Vol 74(1), 80-99.—Examined the effect of age at the beginning of wartime captivity on later psychiatric consequences of such captivity. 80 hospitalized patients who had suffered 5 yrs of captivity in Germany during World War II were given a sociological questionnaire and a psychiatric screening test, the Cornell Index-Form N2. Results point to a significantly higher incidence of personality disorders among the Ss who were the

youngest (19-23 yrs) at the onset of captivity; they had to stop working earlier than the older Ss because of nervousness, anxiety, asthenia, hypochondria, neurocirculatory symptoms, and other psychological problems. (Dutch, English, German, Italian & Spanish summaries)—*Journal summary*.

11882. Monnelly, E. P.; Woodruff, R. A. & Robins, L. N. (VA Outpatient Clinic, Boston, MA) **Manic-depressive illness and social achievement in a public hospital sample.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(3), 318-325.—Male inpatients, 25 with bipolar and 21 with unipolar primary affective disorders and all having brothers, were studied in an attempt to replicate previous findings that bipolar patients and their family members have higher levels of social achievement than unipolar patients and their family members. Results confirm previous results among publically hospitalized patients when they had a history of previous private hospitalization. The hypothesis that a social advantage is associated with bipolar primary affective disorder was not supported by data from publically hospitalized patients without a history of previous private hospitalization. There was no evidence that the patients differed significantly in social achievement from their own siblings. Possible reasons for these findings are discussed, as well as the type of study which would be required to resolve the questions raised by the present investigation.—*Journal abstract*.

11883. Moore, N. C. (Royal Air Force Hosp, Swindon, England) **Psychiatric illness and living in flats.** *British Journal of Psychiatry*, 1974(Nov), Vol 125, 500-507.—Used Ss' Cornell Medical Index scores and consultations with general practitioners to compare psychiatric illness among house and flat dwellers in a military community. Results indicate that flat dwelling did not cause an increase in psychiatric illness, familiarity did not cause an improvement, and increased exposure did not cause a deterioration. (32 ref)

11884. Morgan, R. & Cheadle, J. (St Wulstan's Hosp, Malvern, England) **A scale of disability and prognosis in long-term mental illness.** *British Journal of Psychiatry*, 1974(Nov), Vol 125, 475-478.—Studied 184 long-stay mentally ill patients over a 10-yr period. An evaluation of relevant nosological data on each patient indicates that the best prediction was furnished by 3 variables—J. K. Wing's classification group (see PA, Vol 36:4JQ62W), social withdrawal score, and work performance score. These items were the bases of a scale which may be useful for making prognoses, quantifying and communicating degrees of disability, predicting the caseload on scarce and expensive rehabilitation facilities, and making the best use of these facilities by improving the accuracy with which appropriate patients are selected for them.—*Journal summary*.

11885. Murphy, H. B. (McGill U, Montreal, Quebec, Canada) **Differences between mental disorders of French Canadians and British Canadians.** *Canadian Psychiatric Association Journal*, 1974(Jun), Vol 19(3), 247-257.—Analyzes data indicating that Canadians of British origin differ from Canadians of French origin in their symptoms and in frequency, course, and treatability of mental disorder. French-Canadian schizophrenics show more concern with disturbances of social relation-

ships; British-Canadian schizophrenics show less concern for such relationships and for the support that goes with them. French-Canadian depressives have more motor retardation and more somatic concerns; British-Canadian depressives have more guilt, more obsessions, and more thought disorder. It is concluded that attention to maintaining social ties is more important for the French-Canadian than for the British-Canadian patient, and that the latter emphasizes intrapsychic events. (French summary) (21 ref)—*F. Auld*.

11886. Müller, E.; Presslich, O.; Schuster, P. & Zapotoczky, H. G. (Psychiatrischen Universitätsklinik, Wien, Austria) **[Types of polygraphic reaction to individual-specific stress: An experimental investigation on patients with neurotic disorders.]** (Germ) *Psychiatria Clinica*, 1974, Vol 7(2), 89-100.—32 patients with neurotic, particularly polyphobic, disorders were polygraphically investigated (using as measures their EEG, heart rate, respiratory rate, skin resistance, and blinking rate) while at rest and while exposed either to nonspecific or to patient-specific verbal stimulation. The psychophysical values thus obtained were compared with data obtained from a list of psychic as well as autonomic symptoms. The conventional diagnostic categories of the neuroses did not correspond to any typical physiological patterns; however, some such patterns do appear to be linked to certain abnormal affective states.—*English abstract*.

11887. Nelton, Arne. **[Discussion regarding the concept of mental illness.]** (Swed) *Psykisk Halsa*, 1972, Vol 13(2), 97-113.—Traces the emergence of modern psychiatry, the relationship between physician, patient, and community, and the concept of mental illness. Thomas Szasz's approach, and the Swedish debate regarding illness and health are summarized. The psychologists' role within psychotherapy is discussed and Szasz's approach is described as a therapeutic alternative to conventional psychiatry.

11888. Nichols, Keith A. (U Exeter, Washington Singer Lab, England) **Severe social anxiety.** *British Journal of Medical Psychology*, 1974(Dec), Vol 47(4), 301-306.—Discusses the classification and definition of phobic disorders and questions whether the category of social phobias should be included in such a classification. It is argued that a better term for this particular difficulty is social anxiety. Clinical data are presented in the form of a list of commonly observed features found in 35 people complaining of severe social anxiety. A tentative explanation of the development of social anxiety is discussed and emphasis is placed on certain personality traits and cognitive habits associated with the traits. (18 ref)—*Journal summary*.

11889. Peters, U. H. & Glück, A. (Johannes Gutenberg U, Neuro-Psychiatrische Klinik, Mainz, W Germany) **[The personality at the end of a depressive phase: Observations after termination of endogenous depressive phases.]** (Germ) *Nervenarzt*, 1973(Jan), Vol 44(1), 14-18.—Results of a follow-up study of 53 patients with endogenous depression suggest slow progressive transition, with restructuring of the personality, to a new "state." "Autistic" retreat from taxing interpersonal relations and various ego-protective defense strategies appeared. The relation of the findings to possible effects

of thymoleptic medication is discussed. Supportive psychotherapy for depressives is advocated. (18 ref)—*J. Rüschmann*.

11890. Pilowsky, I. (U Adelaide, SA, Australia) **Psychiatric aspects of stress.** In A. T. Welford (Ed), *Man under stress*. New York, NY: John Wiley & Sons, 1974, 140 p. \$10.95.

11891. Příbyl, R. (Psychiatrická léčebna, Velké Leváre, Czechoslovakia) [Contribution to incorporating rehabilitated psychiatric patients into primary groups.] (Czec) *Československá Psychiatrie*, 1973(Jun), Vol 69(3), 190-194.—Examines attitudes and opinions of work group leaders concerning employment and work performance of ex-psychiatric patients. 65% of the respondents to an anonymous questionnaire would employ ex-patients and 23% would not. The opinion prevailed that it is easier to reintegrate manual than intellectual workers into primary work groups which have high performance requirements. Over half of the work group leaders had never read any publications about mental patients and based their opinions on their own personal experience. (Russian & English summaries)—*V. Fischmann*.

11892. Raskin, Allen; Crook, Thomas H. & Herman, Kenneth D. (NIMH, Psychopharmacology Research Branch, Rockville, MD) **Psychiatric history and symptom differences in black and white depressed patients.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 73-80.—Compared 159 black psychiatric patients with 555 white patients on a battery of social, personality, and psychiatric history variables, as well as presenting symptoms. In making these comparisons, race differences in age, social class status, and sex were controlled. Both black and white depressed patients were remarkably similar on presenting symptoms, especially the core symptoms of depression, when the groups were equated or controlled for age and social class differences. However, some differences did emerge on a number of hostility variables. There was a greater tendency toward negativism and the introjection of anger in blacks than in whites. In addition, depressed black males indicated that they were more likely than their white counterparts to strike back, either verbally or physically, when they felt their rights were being violated. There was also a very high incidence of suicide threats or attempts among the black males. (17 ref)—*Journal abstract*.

11893. Ringel, E. & Sonneck, G. (Psychiatrischen Universitätsklinik, Wien, Austria) [On the problem of a schizophrenic suicidal act: An exceptional case.] (Germ) *Psychiatria Clinica*, 1974, Vol 7(2), 101-119.—Reports on a case in which, with the help of an extensive self-description written over a short period during the initial stages of a schizophrenic illness, a reconstruction could be made of the development of the psychosis as well as of a so-called "typical" schizophrenic suicidal act. An attempt was made to differentiate the illness from "mediumistic psychoses" as described by H. Bender (1972). The development towards the suicide, the passage through the characteristic stages, and the establishment of the presuicidal syndrome were demonstrated. It is believed that this case can contribute to a better psychopathological understanding of the suicidal tendency which builds up gradually at the beginning of a

schizophrenic psychosis. However, the suicidal behavior which often breaks through suddenly in advanced processes does require further detailed investigations. (27 ref)—*English abstract*.

11894. Sathananthan, Gregory L.; Gershon, Samuel & Lenn, Ellen. (New York U, Medical Ctr) **Psychological profiles and effects in acute trauma: A pilot study.** *Diseases of the Nervous System*, 1975(Jan), Vol 36(1), 17-19.—Conducted social and psychological assessments of 24 trauma patients at Bellevue Medical Center's Trauma Unit. All patients were administered the Problem Appraisal, adapted from the admission profile, and Burdock's Structured Clinical Interview upon admission and discharge from the trauma service. Based on differences in assessments and case profiles, 3 categories of trauma patients were developed: those "actively" risking trauma, those "passively" receiving trauma, and psychotics. In terms of these new profiles, the severe depression characteristic of those patients passively receiving trauma suggests a need for psychiatric follow-up. In contrast, psychotic patients, alcoholics, and addicts are more in need of psychiatric treatment while receiving trauma care. The personality and behavioral characteristics of these 3 groups are discussed.—*F. L. Beyer*.

11895. Schmidt, R. M. & Zacher, G. (Martin-Luther U, Halle-Wittenberg, E Germany) [Fulminating catatonia: Disease entity or multigenetic syndrome? Survey and investigation on 50 cases.] (Germ) *Psychiatria Clinica*, 1974, Vol 7(2), 65-74.—Using 50 case histories, an attempt was made to clarify the nosographic and clinical validity of fulminating catatonia as an entity among the psychoses. 4 groups could be established: fulminating catatonia without organic disease; somatic diseases with fulminating catatonia; catatonic excitement states with an intercurrent organic process; and unclassifiable fulminating catatonia. On the basis of this analysis the syndrome cannot be regarded as possessing the characteristics of a special psychosis. It seems more appropriate to regard fulminating catatonia as a nonspecific symptom complex induced by a multilayered causation. (28 ref)—*English abstract*.

11896. Sharpe, Lawrence et al. (New York State Dept of Mental Hygiene, New York) **Comparisons of American, Canadian and British psychiatrists in their diagnostic concepts.** *Canadian Psychiatric Association Journal*, 1974(Jun), Vol 19(3), 235-245.—Compares diagnoses by psychiatrists in the US ( $n = 519$ ), Canada ( $n = 142$ ), and the United Kingdom ( $n = 222$ ). Videotapes of interviews with 3 patients who were difficult to diagnose were shown to subsamples of these psychiatrists. American psychiatrists were more likely to call the patients "schizophrenic"; British psychiatrists used the diagnoses "manic-depressive psychosis" and "personality disorder" more frequently than the Americans did. Canadians fell between the Americans and the British. All 3 groups gave the patients similar ratings on M. Lorr's Inpatient Multidimensional Psychiatric Scale. (French summary)—*F. Auld*.

11897. Smith, Richard H. & Lau, Mayin. (Children's Psychiatric Ctr, Eatontown, NJ) **Developmental lines of achievement.** *Child Psychiatry & Human Development*, 1974(Win), Vol 5(2), 117-125.—Describes a technique

significant difference in enzyme activity between the patient and control groups. There were, however, significant negative correlations between dopamine  $\beta$ -hydroxylase activity and the time spent in the morgue before autopsy, and between enzyme activity of schizophrenics and dosage of chlorpromazine or its equivalent.—*Journal abstract.*

### Behavior Disorders

11906. ———. **Report on the N.Y.U. symposium: Suicide in prison: II.** *Journal of Psychiatry & Law*, 1974(Sum), Vol 2(2), 183-208.—Discusses results of the investigations of 20 suicides that occurred in New York City's correction institutions. The conceptual model on which the findings were organized and evaluated is presented.

11907. Abeleva, I. Yu. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General & Pedagogical Psychology, Moscow) [Psychology of stuttering in adults during various phases of verbal communication.] (Russ) *Voprosy Psikhologii*, 1974(Jul-Aug), No 4, 144-149.—Reviews the characteristics, factors, and possible mechanisms of stuttering. (52 ref)

11908. Ammon, Günter. [The psychodynamics of the suicide event.] (Germ) *Dynamische Psychiatrie*, 1974, Vol 7(1), 1-18.—Discusses the psychodynamics of self-destructive behavior and analyzes 2 suicide cases. The underlying reason for suicidal action is understood as the expression of an archaic hidden identity conflict which develops in the interaction with a surrounding group. It goes back to archaic ego development disturbances and anxieties, the inability to build normal ego functions and ego boundaries, and the creation of an ego deficit (hole in the ego) which can neither communicate with nor separate from the early objects and which is caused by a mother and primary group unable to grow and experience. The potential suicide remains in a subconscious state of symbiotic dependence and object addiction. The loss of this pathological symbiosis and the challenge to have to find his own identity evokes archaic anxiety and leads to self-destruction. (English summary) (22 ref)—T. Fisher.

11909. Angushev, G. I. [An investigation of the interrelationships among mental functions in normal and stuttering adolescents.] (Russ) *Voprosy Psikhologii*, 1974(Jul-Aug), No 4, 96-194.—520 Ss 11-13 yrs old, functional stutterers and normals, were given a battery of perceptual, motor, and cognitive tests. Analysis of results showed significant correlations even between seemingly unrelated functions, and support the idea of the unity of mental functions. The patterns of correlations in normals and in stutterers, however, were different. Factor analysis of the intercorrelations revealed different structures of relationships among the mental functions in the 2 groups that were related to the 2 modes of control, voluntary and involuntary. Stutterers bring to bear more voluntary control on their mental functions than do normals. This hampers the automatization of such functions. (English summary) (28 ref)—L. Zusne.

11910. Annesley, Frederick R. (James Cook U North Queensland, Townsville, Australia) **A study of the relationship between normal and behaviour problem**

**children on reading achievement, intelligence, self concept, and locus of control.** *Slow Learning Child: The Australian Journal on the Education of Backward Children*, 1974(Nov), Vol 21(3), 185-196.—Studied normal children and behavior-problem (BP) children, Grades 3-7, in North Queensland, Australia. BP children were identified by the Walker Problem Behavior Identification Checklist. Underachievement (as measured by the California Achievement Test) was shown by a large percentage of BP Ss, who also had a poorer self-concept than the normal Ss. Normals show higher intelligence (measured by the Australian Council for Educational Research Junior B Test of Intelligence). It is suggested that in working with BP children strong efforts be made to raise academic achievement in order to improve behavior, rather than trying to improve behavior in hopes of raising achievement. (28 ref)—C. L. Nicholson.

11911. Ball, John C.; Graff, Harold & Sheehan, John J. (Temple U, Health Sciences Ctr) **The heroin addicts' view of methadone maintenance.** *British Journal of Addiction*, 1974(Mar), Vol 69(1), 89-95.—Compared patient and staff attitudes on drug-taking and its treatment at the largest methadone maintenance program in Pennsylvania. 4 university medical students interviewed 224 heroin addicts in treatment on June 30, 1971, and 42 staff members at Philadelphia General Hospital and its 2 satellite clinics. 65% of the patients were black, 66% were under 30 yrs of age, and males outnumbered females 7 to 1. Analysis of responses revealed sharp disagreements between addicts and staff concerning the patients' problems. The staff saw patients as physically and mentally ill, while the addicts saw themselves as neither. This lack of agreement as to the reason for a drug problem leads to lack of communication and is aggravated by cultural conflict. The staff members seen by patients as most effective are ex-addict counselors, who are closest to the patient in background and experience. It is concluded that methadone clinics cannot expect great success until complementary views are achieved with patients.—A. P. Balevre.

11912. Bregant, Leopold. [Lowering of motivational level and deviant behavior: Significance of defense behavior and neutralization techniques.] (Slo) *Anthropos*, 1972, No 3-4, 61-62.—Discusses the relationship between deviant behavior and motivation. Deviant behavior is seen as chiefly the product of deficits in the socialization process caused by frustrations of sociocultural and family origin. These deficits lead to lower aspiration levels and to defensive behavior patterns which serve to protect the individual's self respect. If the underprivileged are subjected to the socialization criteria valid for the majority and consistent with social norms, the probability of deviant behavior increases rather than decreases through development of self-protecting mechanisms. Maintenance of motivational goals for the underprivileged based on conformity norms stabilizes deviant motivation techniques and increases the discrepancy between the high motivational requirements of the social environment and the individual's low aspirational motivation. Resocialization is often made impossible by the dogmatic belief that the same normative criteria of motivation are equally appropriate for all individuals

regardless of their different competitive abilities.—S. Slak.

11913. Cohen, Judith B. & Syme, S. Leonard. (U California, School of Public Health, Berkeley) **Epidemiologic approaches to the study of drug dependence.** *Bulletin on Narcotics*, 1973(Jul-Sep), Vol 25(3), 1-9. —Discusses (a) the distribution of drug dependence in the population, (b) clarification of the clinical picture by using exact definitions of drug dependence, (c) factors affecting the risk of drug dependence, and (d) the identification of new syndromes. (19 ref)

11914. Cornbleth, Terry. (University Drive VA Hosp, Pittsburgh, PA) **A psychosocial problem catalogue.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 194.

11915. Costello, Raymond M. & Manders, Kenneth R. (U Texas, Health Sciences Ctr, San Antonio) **Locus of control and alcoholism.** *British Journal of Addiction*, 1974(Mar), Vol 69(1), 11-17. —Studied the performances of 14 active and 14 recovered alcoholics on 2 measures of locus of control, Rotter's Internal-External (I-E) Control Scale and the Experienced Control (EC) Questionnaire by D. W. Tiffany et al. The Marlowe-Crowne (M-C) Social Desirability Scale was also administered to the 2 groups. Excessively low scores on the I-E for drinking groups, found by previous investigators, were replicated. A low scorer on the I-E tended to be a high scorer on the M-C and on EC-OE (the degree to which an individual feels he has control over forces coming from outside himself). A wider sample of Ss was employed to determine the reliability of the I-E as a monitor of the recovery process. The phenomenon measured by the I-E resisted manipulation over a 30-day treatment interval, suggesting that it was a relatively stable personality characteristic in this sample of problem drinkers. The I-E again was related to the EC at the external locus; high scorers on the I-E tended also to score high on the EC-FE (the degree to which an individual feels controlled by pressures, influences, or forces coming from outside himself). A racial effect on I-E was found, such that nonwhites scored higher than whites.—*Journal summary*.

11916. Faschingbauer, Thomas R. (Duke U. Medical Ctr, Highland Hosp, Asheville) **Enuresis: Its nature, etiology, and treatment: A review of the literature, 1924-1970.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 194-195.

11917. Gasser, Edith S.; Langrod, John; Valdés, Katharine & Lowinson, Joyce. (C. W. Post Ctr, Long Island U) **The Eysenck Personality Inventory with methadone maintenance patients.** *British Journal of Addiction*, 1974(Mar), Vol 69(1), 85-88. —Studied 3 groups, each of 34 members or less: narcotic-addict patients, addict patient-counselors (both groups on methadone maintenance), and psychology students. No using the Eysenck Personality Inventory (EPI) or significant differences in extraversion-introversion (E) or neuroticism-stability (N) were revealed; however, the student Ss showed a strong tendency to be less frank in admitting feelings and behavior than the 2 groups on methadone maintenance. The EPI did differentiate between short-term and long-term heroin users on the N scale ( $p < .05$ ). Long-term users demonstrated fewer

neurotic features. The inventory did not differentiate, however, between addicts, ex-addicts and nonaddicts; nor did it indicate addiction proneness. Heroin addicts now on methadone maintenance seemed no more anxious or unable to cope with stress than apparently normal Ss.—A. P. Baileve.

11918. Gillis, A. R. (U Western Ontario, London, Canada) **Population density and social pathology: The case of building type, social allowance and juvenile delinquency.** *Social Forces*, 1974(Dec), Vol 53(2), 306-314. —Argues that the number of individuals per unit space is less appropriate for humans than building type as a correlate of patterns that have been considered socially "pathological." Stepwise regression is used to analyze data from a Canadian city, with the census tract as the unit of analysis. Data show that when the effects of income and national origin have been removed, neither internal nor external density explains a significant amount of the variation in social allowance or delinquency, but building type remains a significant predictor of these variables. A path model is developed, showing that social allowance (welfare) rates, like the proportion of multiple dwellings, is an important predictor of juvenile delinquency rates. (61 ref)—*Journal abstract*.

11919. Goldfarb, Stephen et al. **Time perception of alcoholics and other psychiatric patients.** *Journal of Genetic Psychology*, 1974(Dec), Vol 125(2), 315-318. —A battery of time perception tests evaluating the areas of filled time estimation, empty time estimation, time in abstract reasoning, and short interval comparisons was administered to 30 alcoholic inpatients, 24 general psychiatric inpatients, and 17 normal controls. Tests of abstract reasoning and estimates of unfilled intervals discriminated between the alcoholic and general psychiatric group on the one hand, and the controls on the other. No significant differences between alcoholic and general psychiatric patients were found.—*Journal abstract*.

11920. Jacobson, George R. (De Paul Rehabilitation Hosp, Milwaukee, WI) **Field dependence among male alcoholics: Establishing norms for the Rod-and-Frame Test.** *Perceptual & Motor Skills*, 1974(Oct), Vol 39(2), 1015-1018. —Administered the Rod-and-Frame Test to 145 male alcoholic inpatients (mean age = 41.9 yrs). Data are compared with findings from normal Ss and psychiatric inpatients.

11921. Jones, Ben M. & Paredes, Alfonso. (U Oklahoma, Health Sciences Ctr) **Circadian variation of ethanol metabolism in alcoholics.** *British Journal of Addiction*, 1974(Mar), Vol 69(1), 3-10. —Determined the rate of ethanol metabolism for 20 alcoholics during afternoon and evening drinking sessions on 2 consecutive days. Ss metabolized ethanol faster in the evening than in the afternoon, suggesting a circadian variation in the rate of ethanol metabolism. Drinking on the 1st day appeared to increase the rate of ethanol metabolism on the 2nd day. This circadian variation, which was present after 2 wks of abstinence and 1 day of heavy drinking, differs from that reported for nonalcoholics. This suggests that other circadian rhythms may be affected in alcoholics, even after they have been dried out for several weeks. Altered rhythms may partially explain

alcoholics' difficulty in readjusting to social demands. —*Journal summary.*

11922. Kwaśniewski, Jerzy & Kojder, Andrzej. (U Warsaw, Poland) [Social reaction to deviant behavior: Problems, assumptions, research hypotheses.] (Polh) *Studia Socjologiczne*, 1974, No 2(53), 219-233. —Describes the construction of instruments that will be used in a national study of attitudes toward deviance. Research hypotheses, strategies, and procedures are reviewed at length.

11923. Maletzky, Barry M. (US Lyster Army Hosp, Ft Rucker, AL) **d-Amphetamine and delinquency: Hyperkinesis persisting?** *Diseases of the Nervous System*, 1974(Dec), Vol 35(12), 543-547. —Explored the clinical efficacy of dextroamphetamine for delinquent behavior in adolescents and the relationships between such delinquency and hyperactivity of childhood. 14 pairs of male delinquent teenagers were examined. All were referred for psychiatric outpatient care because of antisocial behavior. The method of sequential analysis was used. A significant positive effect documented the efficacy of dextroamphetamine as compared to placebo when both were added to an ongoing psychotherapeutic regimen. Tolerance, withdrawal, and euphoria were not associated with dextroamphetamine use in the experimental Ss. A reanalysis of the data demonstrated surprisingly close links between a history or presence of hyperactive traits and a clinical response to dextroamphetamine. Difficulties in employing dextroamphetamine in this age group are acknowledged and suggestions for further research are offered. (20 ref)—*Journal abstract.*

11924. McAuliffe, William E. & Gordon, Robert A. (Harvard U) **Issues in testing Lindesmith's theory.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 196.

11925. Ostrianska, Zofia. (Polish Academy of Sciences, Inst of Juridical Sciences, Warsaw) [Self-aggression among recidivists.] (Polh) *Przegląd Penitencjarny i Kryminologiczny*, 1972, Vol 10(2), 20-34. —Studied 220 prisoners who had previously served at least 4 sentences. 123 (56%) had committed acts of bodily harm to themselves, had refused to eat, or had attempted suicide, 76% of them several times; 41% had committed these acts both in and out of prison. Recidivists who aggressed against themselves were significantly more often diagnosed as mentally ill than those who had not. 71% of the aggressors were alcoholics. They said their acts were motivated by frustration (60%), depression (21%), drunkenness (42%), and attempts to improve prison conditions (50%). Self-aggressors scored significantly higher on the Buss-Durkee scales of aggression and guilt feelings. On the F subscale of the MMPI the self-aggressors' mean score was 85, while that of the other recidivists was 75. Self-aggressors had begun their criminal activities earlier in life and offenses were more often directed against persons. (French summary)—A. Z. Arthur.

11926. Person, Ethel S. & Ovesey, Lionel. (Columbia U, Coll of Physicians & Surgeons, Psychoanalytic Clinic for Training & Research) **The psychodynamics of male transsexualism.** In R. C. Friedman, R. M. Richart, R. L. Vande Wiele & L. O. Stern (Eds), *Sex differences in*

*behavior*. New York, NY: John Wiley & Sons, 1974. xvi, 495 p.

11927. Pospiszyl, Kazimierz. [Psychosocial characteristics of the young offenders.] (Polh) *Przegląd Penitencjarny i Kryminologiczny*, 1972, Vol 10(2), 35-51. —93 convicted young boys and girls and 62 controls in 6 schools and agencies were given the Maudsley Personality Inventory, Cattell's Test of Perseveration, and a sociometric test asking which persons the S liked, disliked, or was indifferent to. The Ss were classified according to the offenses committed: theft, hooliganism, prostitution, and rape, and into a group showing minor maladjustment or a group of normal controls. All criminal categories and the maladjusted showed more neuroticism than the controls; hooligans, prostitutes, and rapists were more extraverted; thieves and the maladjusted were more perseverative; prostitutes showed more positive sociometric ratings towards others, while hooligans, rapists, and the maladjusted showed more negative sociometric ratings. (French summary)—A. Z. Arthur.

11928. Pugliese, Anthony C. (Roosevelt Hosp, Methadone Clinic, Metuchen, NJ) **A study of the mental ability of methadone maintenance patients with the Wonderlic Personnel test.** *Journal of Drug Education*, 1974(Fal), Vol 4(3), 323-326. —Administered the Wonderlic Personnel Test to 65 ex-heroin addicts on methadone maintenance. Addicts' scores were compared with those of job applicants tested by Wonderlic and Associates. Results show a significant difference between the methadone Ss and Wonderlic's sample ( $N = 251,253$ ) of the total job market: however, when Ss were matched for education, there were no significant differences. Findings suggest that methadone clients are at a disadvantage in the job market since employers do not often consider comparable educational levels when looking for employees. —*Journal abstract.*

11929. Roessler, Richard T. & Bolton, Brian. (U Arkansas) **Behavior rating correlates of the 16 PF.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1160. —Of 256 possible correlations between major behavioral problems of 434 juvenile offenders and factors from the 16 Personality Factor Questionnaire, only 4 correlations were found.

11930. Schuckit, Marc A. & Gunderson, E. K. (US Navy Medical Neuropsychiatric Research Unit, San Diego, CA) **The use of alcoholic subtype diagnoses in the U.S. Navy.** *Diseases of the Nervous System*, 1974(Dec), Vol 35(12), 563-567. —Studied alcoholism in a military population using 5 alcoholic subtypes as an aid in diagnosis: (a) chronic alcoholism, (b) acute alcoholism, (c) alcoholic psychosis, (d) alcoholic addiction, and (e) unspecified alcoholism. Posthospital course was determined for men who remained on active duty for 6 mo or more after hospitalization from a total sample of 2,949. Ss were categorized according to both this classification system and the Department of Defense Disease and Injury Code. The percentages of alcoholic psychoses in the 2 systems were similar and suggest constancy in diagnostic criteria and judgments. It is suggested, however, that clinicians follow the basic scheme outlined by the National Council on Alcoholism and assign each alcoholic a diagnosis of alcoholism without further subdivision. Only when necessary should

the additional diagnostic subdivisions be utilized. (20 ref)  
—R. S. Albin.

11931. Scott, P. D. (Maudsley Hosp, London, England) **Battered wives.** *British Journal of Psychiatry*, 1974(Nov), Vol 125, 433-441. Defines the battered wife as a woman who has suffered serious or repeated injury from the man with whom she lives. The phenomenon is described as a failure in adaptation rather than a disease entity, or as a failure to acquire adequate social learning. Among the arbitrary types of wife battering which are described, apart from the probably major cultural type, are men with (a) immature personalities; (b) other personality disorders, including the dependent and aggressive types; (c) jealousy reactions; and (d) addictions. Previous studies of small samples of child-battering fathers suggest that at least 25% of them also batter their wives.—*Journal summary*.

11932. Silberzahn, Mary. **Sensory integrative function in a child guidance clinic population.** *American Journal of Occupational Therapy*, 1975(Jan), Vol 29(1), 28-34.—Determined (a) whether sensory integrative disorders occurred in a child guidance population, (b) the nature of sensory integrative disorders found in such a group, and (c) whether there was any relationship between certain types of sensory integrative disorders and specific behavioral traits. Ss were 87 5-9 yr old children, the total number referred to a child guidance clinic because of problems in behavior. All Ss were administered the Southern California Sensory Integration Tests and were observed for neuromuscular deviations. Data from factor analyses show a high incidence of sensory integrative dysfunction in this population. There was considerable evidence of a syndrome known as postural and bilateral integration dysfunction, as well as a strong tendency to show various kinds of behavior problems. (17 ref)—*Journal abstract*.

11933. Skalar, Vinko. [Performance and motivation of prisoners during their prison terms.] (Sloe) *Anthropos*, 1972, No 3-4, 63-66.—Presents data on differences in intelligence test scores (Beta Series and Raven's Progressive Matrices) of 11 prisoners during and after their prison terms, indicating significantly higher postterm performance in normal life conditions. Motivational factors in the prison environment that cause lowering of ability scores and modification in personality inventory results are discussed, and methodological refinements in criminological studies are suggested.—S. Slak.

11934. Sohoni, Neera K. (International Council of Social Welfare, Research & Documentation Ctr in Social Welfare & Development, Bombay, India) **Women prisoners.** *Indian Journal of Social Work*, 1974(Jul), Vol 35(2), 137-148.—The percentage increase in women convicts between 1962 and 1965 was over 4 times the male prisoners. A study of these women indicates that women prisoners should be regarded as a distinctive group deserving specialized attention. A strong effort is called for to "stem the surging crime rate among women." Demographic data showed areas of the country where the female crime rate was highest. The relatively short stay of women in prison (only 5% stay more than 6 mo) raises problems regarding effective rehabilitation during the prison term. There is a discussion of the need to prevent criminal behavior, both before a woman

becomes an offender and in the immediate postrelease period.—I. W. Kidorf.

11935. Streiberg, Gerald. (U Salzburg, Inst of Psychology, Austria) [Juvenile exhibitionists: A casuistic study using the Rorschach Test and TAT.] (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1973, Vol 21(4), 317-328.—Investigated the meaning and nature of exhibitionism in 19 randomly selected juveniles of various socioeconomic background, education, and intelligence. The case history of 1 14-yr-old boy is reported in detail. The examination consisted of the Rorschach test, the Thematic Apperception Test (TAT), a study of biographical data, and an analysis of exhibitionist occurrences. Results confirm the hypothesis that juvenile exhibitionists suffer from a typically disturbed personality structure which is characterized by an unsolved crisis of individuation; difficulties in the process of self-realization; and a distorted attitude toward sex, sex-role, and sex-specific sex-role expectations. The offenders' acts represent, symbolically, a sociopsychologically relevant attempt to break out of their developmental crisis. (English summary)—T. Fisher.

11936. Täschner, Karl-L. (Johann-Wolfgang-Goethe U, Frankfurt/Main, W Germany) **Social data and personality factors of clinically treated young drug users.** *British Journal of Addiction*, 1974(Mar), Vol 69(1), 67-74.—Compiled and interpreted clinical data on 147 habitual drug-user inpatients under 30 yrs of age. Data indicated that sex differences in drug usage are disappearing. Almost 60% of the Ss used several drugs, including opiates and hallucinogens. Nearly half were unemployed, and their social deterioration appeared to be increasing. As the average age of drug users decreases, the risk of untoward social consequences increases. More than 1/2 of the Ss had broken off their formal education. Ss' conflicts were seen as deriving from unrealistic social adjustment, with personal-familial, political, and legal repercussions. As a group, Ss were described as manifesting little psychical but great physical endurance. Physically, they were active, full of initiative, impulsive, and behaviorally uncontrolled. Although sociable and outgoing, they were seen as insecure, unstable, and sensitive, but they showed minimal anxiety and hostility. Use of alcohol was slight among these Ss, but tobacco usage was excessive. (19 ref)—A. P. Balvère.

11937. Weeks, Joseph L.; Mullins, Cecil J. & Vitola, Bart M. (Lackland Air Force Base, Personnel Research Div, TX) **Prediction of drug abuse by the Life Values Questionnaire.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 196-197.

(Charleston, WV) **Selected papers delivered at The Ninth Annual West Virginia School on Alcohol and Drug Abuse Studies, June 17-22, 1973.** Morgantown, WV: West Virginia University, 1973. 165 p.

11939. West, Letitia & Driver, M. V. (St James' Hosp, Portsmouth, England) **Antisocial behaviour, barbiturate addiction and associated electroencephalographic changes.** *British Journal of Psychiatry*, 1974(Nov), Vol 125, 470-471.—Suggests that in view of the unreliability of urine testing, the EEG can be of value in assessing

those addicts who deny taking barbiturates and yet show clinical signs of possible barbiturate intoxication or who have a recent history of violence or behavior change. If the EEG shows little fast activity the denial may perhaps be believed, but if fast activity is prominent one should be very sceptical in accepting the addict's denial of barbiturate usage.—*Journal summary*.

### Learning Disorders & Mental Retardation

11940. Boyce, Lorinne & Dax, E. Cunningham. (Community Health Services, New Town, Tasmania) **Driving behaviour as differentiated by the Tasmanian Ten Year Old Intelligence Test: I. The types and varieties of traffic offences committed by young men of lower intelligence: II. The effect of driver education on the traffic offences committed by young men of lower intelligence.** *Australian Journal of Mental Retardation*, 1974(Jun), Vol 3(2), 40-48.—Compared 2 groups of 400 17-21 yr old males, one having IQs above 100 and the other IQs of 90 or below, as measured during their school years by the Tasmanian Ten Year Old Intelligence Test. Results show that, although the lower intelligence group held the same number of driving licenses, they had more total offenses, particularly nonmoving types. Possible reasons are given as to why these Ss tended to be convicted of these traffic offenses, and preventive actions which could be taken by the police are discussed. It is also shown that a compulsory high school driver education course, when renewed at intervals, reduced the number of nonmoving convictions which characterized persons of lower intelligence.—*Journal abstract*.

11941. Brown, Jason W. & Jaffe, Joseph. (Columbia U, Coll of Physicians & Surgeons) **Hypothesis on cerebral dominance.** *Neuropsychologia*, 1975(Jan), Vol 13(1), 107-110.—Hypothesizes that cerebral dominance is a continuous process which evolves throughout life and which accounts for the age-dependent forms of aphasia. In addition to progressive (left) language lateralization, there may also be a continuing specification within the wider left-hemispheric speech zone. The notion of cerebral dominance must be qualified to mean "dominance for what function at what age under what conditions of testing?" Thus it might be argued that the right hemisphere is dominant during the prelinguistic period and that presumably nascent left-hemispheric skills are progressively brought into play as speech develops. The evidence points to a need for a "life-span" aphasiology. This hypothesis has testable consequences. (French & German summaries) (32 ref)—*Journal abstract*.

11942. de Villiers, Jill. (Harvard U) **Quantitative aspects of agrammatism in aphasia.** *Cortex*, 1974(Mar), Vol 10(1), 36-54.—Speech transcripts from 8 nonfluent aphasics and 5 normal controls were analyzed for the presence or absence of 14 grammatical morphemes in their obligatory contexts. A stable difficulty ordering was found for the aphasics which differed from the invariant order of acquisition of these morphemes established for children. Transformational and semantic complexity, redundancy, stress, and frequency are assessed as explanatory factors. Aphasics were also clearly different from normals in terms of the frequency of contexts for

the morphemes that could be identified in their speech.—*R. Gunter*.

11943. Downing, John. (U Victoria, British Columbia, Canada) **[Cultural and linguistic conflicts contributing to failure to learn to read.]** (Fren) *Enfance*, 1974(Jan-Apr), No 1-2, 93-110.—Information from 14 countries, including those that use different alphabets, those with alphabetic as opposed to ideographic writing, and those which differ markedly though using the same alphabet was examined with respect to factors involved in learning to read and write. There is more concern about reading disability in the US than in most countries but the incidence of reading disability is at least as great elsewhere, and the reason for between-country difference in concern is not clear. Whether the incidence of disability is greater among boys or girls seems to be associated with culturally determined sex-role expectations. In the interest of mental health, Scandinavian countries delay school entrance and are concerned about overall readiness for school rather than readiness for reading. Bilingualism, dialects, and the fact that in many languages words are not spelled as they are pronounced contribute to the incidence of reading retardation. Whatever the reason why a child has difficulty learning to read, lack of success produces a diminution of self-esteem which in turn hampers school learning of all kinds. (28 ref)—*S. S. Marzolf*.

11944. Flowers, Charles B. (U Washington) **Proactive interference in short-term recall by aphasic, brain-damaged nonaphasic and normal subjects.** *Neuropsychologia*, 1975(Jan), Vol 13(1), 59-68.—18 aphasic, 18 brain-damaged nonaphasic, and 18 normal Ss performed a short-term recall task, and groups were compared with regard to (a) the amount of proactive interference occurring in short-term memory and (b) amount of proactive interference release occurring in short-term memory as a result of changing stimulus material. The aphasic Ss had, in general, mild communication problems. All 3 groups demonstrated approximately the same degrees of proactive interference and proactive interference release. However, the aphasic Ss were able to recall fewer items than the others. The relatively poor recall by the aphasic Ss appeared due to factors operating within trials during the recall task. (French & German summaries) (21 ref)—*Journal abstract*.

11945. Friedland, Seymour J. & Meisels, Samuel J. **An application of the Piagetian model to perceptual handicaps.** *Journal of Learning Disabilities*, 1975(Jan), Vol 8(1), 20-24.—Discusses Piaget's proposition that the development of children's concepts of space is characterized by an advancement from an initially topological conception of space to a space characterized by Euclidean properties. The former is characterized by relationships between points which are unaffected by continuous deformation and transformation, while the latter is identified by relationships between various fixed coordinates and shapes. The usefulness of Piaget's work in providing a developmental explanation of some aspects of spatial organization associated with children with perceptual handicaps is examined.—*Journal abstract*.

11946. Gardner, James M. (U Queensland, St Lucia, Australia) **The legal rights of people in institutions.**

*Australian Journal of Mental Retardation*, 1974(Jun), Vol 3(2), 34-39.—Discussed the struggle to provide legal rights for people in institutions for the mentally retarded, with particular relevance to recent activities in the US. The major content areas include the right to treatment, the right to be free from involuntary servitude, and commitment laws. It is concluded that changes in the legal system, regardless of their positive worth, are only one phase in humanizing the lives of people who are labelled mentally retarded. (15 ref)—*Journal abstract*.

11947. **Geoffrion, Leo D.** (Johns Hopkins U) **Oral reading errors of normal and reading-disabled children.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 201.

11948. **Ghosh, A.** (Postgraduate Inst of Medical Education & Research, Chandigarh, India) **Mental retardation: Historical aspects.** *Indian Journal of Mental Retardation*, 1974(Jul), Vol 7(2), 86-88.—Sketches the history of the treatment of mental retardation. It is felt that the future is full of promise because of improved attitudes toward the retarded and widespread attacks on the problem of retardation.

11949. **Goldstein, Earl H.** (Western Psychiatric Inst & Clinic, Pittsburgh, PA) **A multidisciplinary evaluation of children with learning disabilities.** *Child Psychiatry & Human Development*, 1974(Win), Vol 5(2), 95-107.—Presents 5 clinical case studies of children with learning problems. The clinical application of the term "learning-disabled child" is discussed in relation to the cases. An informal educational evaluation for the physician in residency and in practice to recognize the learning-disabled child is outlined in detail. The role of the neurological examination and EEG in the field of learning disabilities is reviewed, and a multidisciplinary approach for the evaluation and treatment of these children is proposed.—*Journal abstract*.

11950. **Hamashige, Tamie.** (Tokyo U of Education, Japan) **[A study on the discrimination learning in mentally retarded children: Effects of attention to the stimulus dimension.]** (Japn) *Japanese Journal of Special Education*, 1974(Jun), Vol 12(1), 24-32.—Compared rates of discrimination learning of normal and retarded children, particularly with regard to color and form preferences.

11951. **Jackson, Merrill S.** (Monash U, Faculty of Education, Clayton, Vic, Australia) **The rights of the retarded.** *Australian Journal of Mental Retardation*, 1974(Jun), Vol 3(2), 30-33.—Reviews court cases as a means of illustrating the problems encountered by the mentally retarded and their families. The United Nations' "Declaration of the Rights of the Mentally Retarded Persons" is also presented and discussed.

11952. **Keele, Doman K. et al.** (Texas Southeastern Medical School) **Role of special pediatric evaluation in the evaluation of a child with learning disabilities.** *Journal of Learning Disabilities*, 1975(Jan), Vol 8(1), 40-45.—Attempted to determine the precision of the special pediatric evaluation in correctly identifying children with learning disabilities, the proportion of learning disabled (LD) children who exhibit significant pediatric findings, and which LD children are benefited by a special pediatric evaluation. 2 pediatric specialists, utilizing 9 pediatric factors, diagnosed learning disabili-

ties correctly in 91% of the 629 cases evaluated but overdiagnosed it in 30% of nonlearning disabled children. The following were present in a significantly higher percentage of cases of learning disabled children compared to nonlearning disabled children: significant high risk conditions for brain damage or dysfunction in the medical history, minor neurological dysfunction, obesity, teacher and parents reporting a learning disability in the child, poorly drawn 2-dimensional figures, and delayed word recognition. Evaluation by a pediatric specialist in learning disabilities is indicated in the learning disabled child with motor hyperactivity and in certain other instances. Since an evaluation by a specialist in learning disabilities is not possible in every learning disabled child, a procedure for referral is suggested. (15 ref)—*Journal abstract*.

11953. **Mastyukova, Ye. M.** (Central Serbsky Forensic Psychiatry Research Inst, Moscow, USSR) **[Memory disorders in children with underdeveloped speech.]** (Russ) *Defektologiya*, 1972, No 5, 12-17.—Examines memory in 106 1st-8th grade students in a school for children with speech defects. All Ss had some mastery of sentences, but the level of mastery and the specific form of speech disturbance varied. Short-term visual and verbal memory, long-term verbal memory, and the influence of retroactive inhibition were tested. The extent to which memory was disrupted depended on the degree and character of speech underdevelopment; e.g., retroactive inhibition was manifested in the difficulty experienced by most Ss in correctly reproducing the first of 2 unrelated sentences or stories. The quality of this reproduction was a function of the level of development of the lexical-grammatical aspect of the S's speech. This task was particularly difficult for children with alalia or with underdevelopment of intellect and speech.—*E. C. Koffman*.

11954. **McConkey, Roy & Herriot, Peter.** (U Manchester, Hester Adrian Research Ctr, England) **The role of the blocked presentation in the elicitation of a categorical strategy of remembering with retarded adults.** *British Journal of Psychology*, 1974(Aug), Vol 65(3), 415-425.—Conducted 3 experiments with a total of 80 retarded adults to determine the role of blocked presentation of categorical material in increasing the number of items recalled by retarded Ss. With visually and simultaneously presented items in a multitrial free-recall procedure, it was found that (a) although blocked presentation of categorical material facilitated recall, the provision of category cues did not do so; (b) blocked presentation of unrelated items did not facilitate recall; and (c) those Ss who could form their own blocked presentation improved their recall as a result. It is concluded that blocked presentation facilitates recall because it draws attention to previously existing inter-item associations. (15 ref)—*Journal abstract*.

11955. **Murthy, R. S.** **Mental retardation: Scope for prevention: I. Nutrition.** *Indian Journal of Mental Retardation*, 1974(Jul), Vol 7(2), 49-57.—Briefly reviews literature (chiefly research in India) on the relationship between retardation and malnutrition; the studies indicate a causal link. Recommended preventative measures are (a) improved agricultural methods, (b) curtailing population growth, (c) public education, and

(d) intensive research into fetal and infantile brain development. (20 ref)—J. H. Pflaum.

11956. Nagafuchi, Masaaki & Murakami, Teiji. (Tohoku U, Sendai, Japan) [Intelligibility of distorted speech sounds shifted in frequency and time in normal children and the mentally retarded.] (Japn) *Japanese Journal of Special Education*, 1974(Jun), Vol 12(1), 43-53.—20 monosyllabic sounds and 10 trisyllabic words were distorted by means of a speech stretcher; 3 levels of expansion and 3 levels of compression were used both on the frequency and the time. Ss were 160 normal children of chronological age (CA) 6-17, 10 young adults, and 97 retarded children of CA 6-17, mental age (MA) 3-12, and IQ 31-77. Intelligibility decreased with greater frequency distortion. It increased with CA up to 11 yrs in normal Ss, and with MA in retarded Ss. For time-compressed stimuli, the intelligibility was similar for both groups, while for time-expanded stimuli it was better for retarded children than for normals matched in MA. No sex differences were found. The intelligibility of greatly distorted stimuli dropped sharply in retarded Ss and was significantly lower in Ss with IQ 30 than in those with IQ 40. (English summary)—S. Ohwaki.

11957. Panda, Kailash C. & Lynch, William W. (SCS Coll, Puri, India) Effects of race and sex on attribution of intellectual achievement: Responsibility for success and failure situations among educable mentally retarded children. *Indian Journal of Mental Retardation*, 1974(Jul), Vol 7(2), 72-80.—Conducted a locus-of-control study with 249 educable mentally retarded (EMR) children—157 boys (100 black, 57 white) and 92 girls (50 black, 42 white)—from 2 inner-city junior high schools in a midwestern city in the US. The Intellectual Achievement Responsibility test was administered. Ss indicated greater externality in described failure situations than in success situations ( $p < .05$ ), and male Ss appeared to be more internally controlled than females ( $p < .05$ ). Ethnic-group membership did not produce a significant main effect or a significant interaction with sex. Differences between EMR and normal Ss are discussed. (22 ref)—J. H. Pflaum.

11958. Robinson, M. R. (U Queensland, Fred & Eleanor Schonell Educational Research Ctr, St Lucia, Australia) The role of instruction in the acquisition of a concept of space: An exploratory clinical investigation. *Slow Learning Child: The Australian Journal on the Education of Backward Children*, 1974(Nov), Vol 21(3), 164-177.—Conducted an experiment on the acquisition of a concept of space, according to J. Piaget's theories and levels. Ss were 9 retarded children 3-5 yrs old. The various levels are described. Results confirm Piaget's observations. The age levels of spatial concept development need not be fixed, although their order may be constant. Instruction tended to improve Ss' performance. All were from culturally advantaged homes and were able to utilize language as a learning mediator in their approach to the task. It is suggested that the mentally retarded child may be capable of attaining higher levels of concept development than is generally assumed, given special instruction emphasizing his abilities.—C. L. Nicholson.

11959. Rosenheim, Harold D. & Ables, Billie S. (US Army Mental Hygiene Consultation Service, Ft Buckner,

Okinawa) Social deprivation and "mental retardation." *Child Psychiatry & Human Development*, 1974(Sum), Vol 4(4), 216-226.—Proposes that study of the effects of social deprivation may help to understand psychological etiological factors in "mental retardation." Social deprivation, a relative construct, is viewed as resulting from the difference between predeprived and deprived levels of adult social stimulation, and as being greatly affected by the rate of change. A case history illustrates how the relative social deprivation thesis can contribute to a better understanding of the child's emotional and intellectual development and of treatment techniques. (21 ref)—*Journal abstract*.

11960. Sasanuma, Sumiko. (Tokyo Metropolitan Inst of Gerontology, Japan) Kanji versus kana processing in alexia with transient agraphia: A case report. *Cortex*, 1974(Mar), Vol 10(1), 89-97.—A 43-yr-old, right-handed, Japanese school teacher exhibited the syndrome of alexia with transient agraphia as a result of a cerebrovascular accident. Examination of the syndrome revealed that 2 types of orthographic symbols in Japanese, *kana* ("syllabic" symbols) and *kanji* ("ideographic" symbols), were impaired in different manners; i.e., the patient used different strategies in trying to retrieve graph-meaning associations of words written in each type of symbol. The finding is interpreted to indicate that the processing of *kana* and *kanji* represents distinctively different modes of operation of linguistic behavior. The additional nonverbal symptoms exhibited by the patient included color-naming difficulty, topographical disorientation, impairment in written calculation, and visuoperceptual and visuoconstructional disabilities. Most of these symptoms were transient, however, and disappeared during the 1st few months after onset of illness.—R. Gunter.

11961. Schechter, Marshall D. (State U New York, Upstate Medical Ctr, Syracuse) Psychiatric aspects of learning disabilities. *Child Psychiatry & Human Development*, 1974(Win), Vol 5(2), 67-77.—Discusses the necessity of the differential diagnostic and treatment processes required for working with learning-disabled children. Special consideration is given to the psychiatric implications of symptoms which accompany minimal cerebral dysfunction. Anxiety, depression, disturbance in primary attachment to adults, and negative self-image are considered.—E. S. Goodman.

11962. Schoenwetter, Charles D. (U Wisconsin, Madison) Primary care's responsibility to early success in school. *Journal of School Health*, 1974(Jun), Vol 44(6), 307-309.—Describes a treatment approach for children who are diagnosed early in their school careers as high risks to fail. Specific suggestions are made for ways in which physicians can contribute to the early diagnosis and help for children with perceptual difficulties.

11963. Semel, Eleanor M. & Wiig, Elisabeth H. (Boston U) Comprehension of syntactic structures and critical verbal elements by children with learning disabilities. *Journal of Learning Disabilities*, 1975(Jan), Vol 8(1), 46-51.—Assessed the comprehension of syntactic structures and critical verbal elements in 34 learning disabled (LD) children using the Northwestern Syntax Screening Test (NSST) and the Assessment of Children's Language Comprehension (ACLC). Performances were

compared with normative data and with performances by 17 academically achieving controls. LD children scored significantly lower than their controls on the NSST receptive subtest, and a significant percentage scored below the 10th percentile when compared with normative data. Performances on the receptive and expressive subtests of the NSST correlated positively and significantly. LD children performed similarly to normative 6½-yr-olds on the ACLC while the academically achieving controls showed a ceiling effect. Findings suggest that the NSST and ACLC may be used for screening and identification of language comprehension deficits in LD children. Performances by younger (ages 7-9) and older (ages 9-11) LD children did not differ significantly, suggesting that deficits in auditory comprehension may not improve spontaneously with age. (19 ref)—*Journal abstract*.

11964. Spitz, Herman H.; Winters, John J.; Johnson, Shirley J. & Carroll, Janice G. (E. R. Johnstone Training & Research Ctr, Bordentown, NJ) **The effects of spatial, temporal, and control variables on the free-recall serial position curve of retardates and equal-MA normals.** *Memory & Cognition*, 1975(Jan), Vol 3(1), 107-112.—In Exp I 7 pictures were sequentially illuminated at a 3-sec rate through 7 translucent windows. A different window provided the starting point for each of 7 tests. 14 retarded and 14 normal children (mean chronological ages = 16.1 and 8.7 yrs, respectively) of equal mental ages (9.6 and 9.5 yrs, respectively) produced equivalent free recall and reliable recency effects. Although groups did not differ significantly at any portion of the curve, only the normals produced a significant primacy effect. The spatial end anchors produced no significant primacy or recency effects. In Exp II with similar numbers and types of Ss, total presentation time remained the same but the pictures were presented at a 1-sec rate. Variations in elapsed time and number of presentations produced a negative primacy effect, a result attributed to the prevention of selective rehearsal and the resultant interaction of trace decay and order of recall. Superior recall by the normals, particularly in the recency portion of the curve, was attributed to group differences in order of recall strategies. (19 ref)—*Journal abstract*.

11965. Tallal, Paula & Piercy, Malcolm. (John F. Kennedy Inst, Baltimore, MD) **Developmental aphasia: The perception of brief vowels and extended stop consonants.** *Neuropsychologia*, 1975(Jan), Vol 13(1), 69-74.—12 developmental aphasic children and their 12 matched controls were examined for their ability to discriminate (a) 2 synthesized vowel-vowel syllables in Exp I and (b) 2 synthesized consonant-vowel syllables in Exp II. For both vowels and consonants, dysphasics were impaired when the discriminable components of the 2 stimuli were brief (43 msec) but unimpaired when these components were 95 msec or longer. It is concluded that developmental dysphasics have no difficulty in discriminating transitional auditory information as such and that their impaired discrimination of synthesized stop consonants is attributable solely to the brief duration of the discriminable components. (French & German summaries)—*Journal abstract*.

11966. Tomiyasu, Yoshikazu; Matsuda, Sei; Murakamai, Eiji & Emi, Yoshitoshi. (Inst for Develop-

mental Research, Aichi Prefectural Colony, Japan) **[Structure of the adaptive behavior of the mentally retarded: I. A factor-analytic study.]** (Japn) *Japanese Journal of Special Education*, 1974(Jun), Vol 12(1), 10-23.—Administered the Japanese translation of the Adaptive Behavior Scale to 1,971 retarded children and 6,092 retarded adults. Significant factors in Part I of the scale were Personal Independence (e.g., self-care and motor ability), Social Adjustment (e.g., telephone usage, locomotion, money handling, speaking, and writing), and Personal and Social Responsibility (e.g., initiative, persistence, self-direction, and socialization). In Part II, Antisocial-aggressive Behavior, Self-stimulating Behavior, and Deficient Interpersonal Behavior were 3 significant factors both for children and adults. (English summary)—S. Ohwaki.

11967. Vellutino, Frank R.; Steger, Joseph A.; Harding, Constance J. & Phillips, Forman. (State U New York, Albany) **Verbal vs non-verbal paired associates learning in poor and normal readers.** *Neuropsychologia*, 1975(Jan), Vol 13(1), 75-82.—A total of 60 normal and 60 poor readers from 4th, 5th, and 6th grades were compared on verbal and nonverbal paired-associates tasks involving visual and auditory components. The performance of the poor readers was equivalent to that of the normals on the nonverbal tasks but inferior on the verbal tasks. Results are interpreted as consistent, either with the possibility of select language (intrahemispheric) disorder, in poor readers, or with dysfunction, unique to visual-verbal (interhemispheric) integration. These alternatives are discussed, and it is suggested that additional research is needed to evaluate their validity. (French & German summaries) (23 ref)—*Journal abstract*.

11968. Weinstein, Edwin A. & Pulg-Antich, Joachim. (Mt Sinai Hosp, New York, NY) **Jargon and its analogues.** *Cortex*, 1974(Mar), Vol 10(1), 75-83. Two patients with jargon aphasia exhibited verbal stereotypy, echolalia, and "officialese" in the course of recovery. It is suggested that these forms of language are analogous to jargon in that while the content lacks referential meaning, they serve as a mode of adaptation to stress.

11969. Wunderlich, Richard A. (Catholic U of America) **Effect of S-R discontinuity and double responding on two-odd oddity learning by retardates.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1327-1331.—36 institutionalized children whose mental age scores were at least 3 yrs below their chronological ages (12-17 yrs) were divided into 3 matched groups of 12 Ss each and presented with a 2-odd oddity discrimination. In 2 groups—stimulus-response (S R) and double-response—a 6-in spatial gap was imposed between the oddity stimuli and the site response. Group double-response differed from Group S-R only in requiring a double response (i.e., touching a chosen stimulus before making a response). In a 3rd group (S + R), no spatial discontinuity between stimulus and response existed; Ss responded directly to the oddity stimulus and not to the remote response block. In contrast to earlier studies there was little effect of discontinuity or of double responding on performance. Most Ss learned the oddity discrimination regardless of their experimental condition and in this regard were unlike retardates of other studies. (15 ref)—*Journal abstract*.

11970. Yeni-Komshian, Grace H.; Isenberg, David & Goldberg, Herman. (Johns Hopkins U, Medical School) **Cerebral dominance and reading disability: Left visual field deficit in poor readers.** *Neuropsychologia*, 1975(Jan), Vol 13(1), 83-94.—Compared the performance of 19 good- and 19 poor-reading 5th-7th graders on dichotic listening of digits (DL), visual half-field presentation of Arabic numerals (VHF-N), and visual half-field presentation of digits written as words (VHF-W). Right ear superiority on the DL test was equal in both groups. The poor readers were more lateralized than the good readers on the VHF-N and VHF-W tests. Right VHF scores were at about the same level of accuracy in both groups. The deficit that the poor readers showed was most evident in their left VHF scores. Results suggest that poor readers either suffer from some form of degraded processing in the right hemisphere or that the transmission from the right to the left hemisphere is degraded. (French & German summaries) (33 ref) —*Journal abstract.*

### Speech Disorders

11971. Adams, Martin R. & Hutchinson, John. (Purdue U) **The effects of three levels of auditory masking on selected vocal characteristics and the frequency of disfluency of adult stutterers.** *Journal of Speech & Hearing Research*, 1974(Dec), Vol 17(4), 682-688.—Tested the hypothesis that the growth function of the masking effect in stuttering behavior is promoted by systematic increases in vocal intensity. 16 normal-hearing young adult stutterers read aloud in 4 conditions (quiet and 10-, 50-, and 90-db sensation levels of continuous white noise). The oral readings were tape recorded. The recorded data were analyzed later to quantify Ss' vocal intensity, stuttering frequency, and reading time in each condition. Results show that under various levels of masking, there was an inverse relationship between vocal intensity and stuttering frequency. Results of reading time comparisons between conditions were affected by the absolute frequency of stuttering in quiet or the magnitude of the masking effect or both. Changes in vocal intensity are translated into physiological terms and interpreted in light of how they might promote fluency and reduce stuttering.—*Journal abstract.*

11972. Conture, Edward G. (Syracuse U) **Some effects of noise on the speaking behavior of stutterers.** *Journal of Speech & Hearing Research*, 1974(Dec), Vol 17(4), 714-723.—Determined the influence of the loudness and spectrum of noise stimuli on stuttering frequency, reading rate, and vocal level of 9 adult male stutterers. During each of 6 noise conditions and 1 non-noise condition, Ss continuously read aloud prose passages during 4 successive 5-min periods. Low-pass, high-pass, and broad-band noise, psychophysically equated for loudness at 2 different levels, was presented during the 3rd period of the 6 noise conditions. Stuttering frequency, reading rate, and vocal level were measured for the 2nd and 3rd periods of all conditions. Ss increased their vocal level while decreasing their stuttering frequency as a result of the loudness rather than of the frequency spectrum of the noise. Reading rate was not significantly influenced by changes in loudness or frequency spec-

trum. Results do not support the findings of others that low-pass noise decreases stuttering more than does high-pass noise. (18 ref)—*Journal abstract.*

11973. Gabriyal, Talat M. (Ein-Shamskii U, Cairo, Egypt) **[An analytic study of situations associated with stuttering.]** (Russ) *Defektologiya*, 1972, No 5, 23-28.—Constructed a questionnaire containing a list of 129 situations and a scale to indicate the degree to which a given situation provokes stuttering. 50 stutterers (high school, institute, and university students) were asked to rate each situation on the scale, from 0 (stuttering absent) to 3 (marked stuttering present). The 129 situations were classified into 11 categories, each consisting of 2 groups of situations: those associated with an increase in stuttering and those associated with a decrease in or absence of stuttering. For each category the *M* values ascribed to its 2 groups were calculated and the statistical significance of the difference between the *M*s was ascertained through the use of a *t* test. This difference was significant in 10 of the categories. It is concluded that most situations leading to stuttering can be so classified and even predicted.—*E. C. Koffman.*

11974. Gilmore, Stuart I. (Louisiana State U) **Social and vocational acceptability of esophageal speakers compared to normal speakers.** *Journal of Speech & Hearing Research*, 1974(Dec), Vol 17(4), 599-607.—Conducted a study with 2 esophageal and 2 normal male speakers which estimated the effect of (a) visual, auditory, and simultaneous audiovisual presentation of the speakers and (b) simple expository introductions of the speakers. A group of 480 members of business and professional men's groups evaluated the 4 speakers on 1 social and 3 vocational criteria. Statistical analysis indicated the esophageal speakers were perceived as being significantly less acceptable ( $p < .001$ ) than the normal speakers regardless of whether the judgments were based on visual, auditory, or simultaneous visual and auditory impressions. Information about the esophageal speakers significantly raised their acceptability, with the exception of the criterion of public contact in employment. The criterion measures used in this study might serve as objective indicators of the degree to which communicative disorders handicap adults. (35 ref) —*Journal abstract.*

11975. Soltøft-Jensen, Per. (School Psychological Office, Hobro, Denmark) **[Elective mutism in school psychological practice.]** (Danish) *Skolepsykologi*, 1975, Vol 12(1), 3-16.—Reviews the literature and presents 3 cases. The symptom is defined by selective speech even if language functions are sufficient for normal verbal reaction to situations. Etiological considerations may distinguish between simple-reactive and neurotic mutism; these may be total, elective, or hysterical-demonstrative. In separate categories are mutism connected with psychoses and cerebral disturbances of speech. Elective mutism patients seen in clinics are shy, withdrawn, and sensitive and often exhibit other neurotic symptoms. Intelligence seems normally distributed but the symptom may appear in families. Treatments may involve psychotherapy or behavior modification. The school has a central role in early diagnosis, support, and treatment.—*P. Mylov.*

11976. Woods, C. Lee. (U Iowa) **Social position and speaking competence of stuttering and normally fluent boys.** *Journal of Speech & Hearing Research*, 1974(Dec), Vol 17(4), 740-747.—Obtained ratings of social position and speaking competence from 48 male, stuttering 3rd and 6th graders (24 mild and 24 moderate or severe) and from 562 of their normally fluent male classmates. Peer ratings, self-estimates of ratings, and reasons for certain ratings also were obtained. No significant differences between groups of stuttering Ss were found. Upon comparison with fluent Ss, stutterers expected to be and were rated significantly poorer as speakers than were the normally fluent. No significant differences were found, however, between stuttering and fluent Ss on social position measures, suggesting that whether or not an elementary-school-age male stuttered was of minor importance in determining his social role among his peers. (24 ref)—*Journal abstract*.

11977. Zimmermann, Gerald N. & Knott, J. R. (U Iowa, Div of Electroencephalography & Neurophysiology) **Slow potentials of the brain related to speech processing in normal speakers and stutterers.** *Electroencephalography & Clinical Neurophysiology*, 1974(Dec), Vol 37(6), 599-607.—Used a contingent negative variation (CNV) paradigm to study slow potential shifts of the brain in stutterers and normal speakers during speech and nonspeech verbal tasks and a nonverbal manual task. Ss were 9 male stutterers and 5 normal speakers ranging in age from 20 to 29 yrs. Results show that vertex CNVs were similar in normal speakers and stutterers in the verbal and nonverbal tasks. Differences were found between groups at the lateral electrode derivations in both verbal tasks. Preceding speech, 4 of 5 normal speakers showed a larger shift in the left hemisphere than in the right, while only 22% of the stutterers showed a left greater than right asymmetry. In the verbal condition in which Ss did not speak, similar relationships were observed. It is concluded that left and right inferior frontal areas of nonstutterers and stutterers performed differently even when stutterers were not approaching a moment of stuttering. (French summary) (29 ref)—*Journal summary*.

### Physical & Toxic Disorders

11978. Assal, G. & Müller, C. (U Lausanne, Switzerland) **[Delirious manifestations of long duration following traumatic and tumorous injuries of the central nervous system.]** (Fren) *Schweizer Archiv für Neurologie, Neurochirurgie und Psychiatrie*, 1973, Vol 112(1), 115-121.—Examined the clinical records of 244 patients with post-brain-damage traumas and 124 patients with brain tumors to investigate the occurrence of ensuing delirious-psychotic manifestations of long duration. 3 case histories are described and discussed. The delirium case histories are described and discussed. The delirium is seen as different from schizophrenia and interpreted as a psychotic reaction of compensation, its duration explained by the severely limited possibilities of readaptation.

11979. Baker, Susan W. & Ehrhardt, Anke A. (State U New York, Medical School, Buffalo) **Prenatal androgen, intelligence, and cognitive sex differences.** In R. C. Friedman, R. M. Richart, R. L. Vande Wiele & L. O.

Stern (Eds), *Sex differences in behavior*. New York, NY: John Wiley & Sons, 1974. xvi, 495 p.

11980. Basso, A.; Bisiach, E. & Faglioni, P. (U Milan, Ctr of Neuropsychology, Italy) **The Mueller-Lyer illusion in patients with unilateral brain damage.** *Cortex*, 1974(Mar), Vol 10(1), 26-35.—Assessed linear length discrimination and susceptibility to the Müller-Lyer illusion in normals and unilateral brain-damaged patients. Right brain-damaged patients with visual field defects were found impaired in linear length discrimination. Left brain-damaged patients showed a reduced susceptibility to the illusion. Corrections in the Müller-Lyer scores brought about by the scores of a test of oral comprehension were not significant. These findings are discussed in relation to the theory that hemispheric asymmetry in perception can be explained in terms of analytic vs holistic processing of patterns.—R. Gunter.

11981. Bauer, Rudolph & Kenny, Thomas. (U Maryland Hosp, Medical School, Baltimore) **An ego disturbance model of MBD.** *Child Psychiatry & Human Development*, 1974(Sum), Vol 4(4), 238-245.—Interprets minimum brain dysfunction (MBD) in terms of impairment of ego function, a concept which permits differentiation from other childhood disorders. The MBD child is described as mildly disturbed in the areas of autonomous function, cognitive focusing, and concept formation, whereas reasoning skills, reality testing, and synthetic function are normal. The disorder may be understood by the individual pattern of ego strength and impairment, which also suggests an appropriate therapeutic regimen, i.e., one which concentrates on areas of deficiency.—E. S. Goodman.

11982. Becker, Sheila. (Montreal Oral School for the Deaf, Quebec, Canada) **The performance of deaf and hearing children on a logical discovery task.** *Volta Review*, 1974(Dec), Vol 76(9), 537-545.—Adapted a nonverbal concept attainment task of Bruner and Goodnow for use with 42 deaf and 48 hearing children of school age. Scores of both groups improved with age, but at all ages the deaf Ss had a higher error score than the normals. Deaf Ss' oral ability was not related to their ability to form concepts. Deaf children used trial-and-error strategies slightly more than hearing children, and tended to apply sophisticated but inappropriate strategies. Results may provide some support for J. Piaget's theories about the relation between language and intellectual development.—W. A. Hass.

11983. Brown, Bill R.; Morgan, Ben B. & Alluin, Earl A. (Eds.). (U Louisville, Performance Research Lab) **Final report on the behavioral effects of infectious diseases.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 157.

11984. Chandrasekaran, R. (Postgraduate Inst of Medical Education & Research, Chandigarh, India) **Galactosemia: A short communication.** *Indian Journal of Mental Retardation*, 1974(Jul), Vol 7(2), 98-102.—Galactosemia is a metabolic disorder involving a deficiency of galactose-1-phosphate uridyl transferase and making it impossible for the patient to assimilate milk or milk products. It is manifested in infants by listlessness, jaundice, failure to gain weight, and mental retardation. If a diet of atta, and/or other nutrients which do not contain galactose, is substituted for milk in early infancy.

intelligence can in many cases develop normally.—J. H. Pflaum.

11985. Diehl, L. W. (Freien U, Psychiatrische Klinik, Berlin, W Germany) [**Psychopathological syndromes in epilepsy.**] (Germ) *Psychiatria Clinica*, 1974, Vol 7(2), 75-83.—Systematic presentation of psychopathological syndromes in epilepsy indicates that the preoccupation with these phenomena is important to clarify essential problems in general psychiatry. Although there is a division into reversible and irreversible psychopathological syndromes, the different complexes of symptoms can nevertheless overlap. There is no nosologic specificity of psychopathological phenomena in epilepsy, which corresponds to general psychiatric experience. The division presented is to be understood as a coordinate system. The current state of development of pathological cerebral dysfunctions in a epileptic person is thus to be recorded in its course on the strength of psychopathological effects. (21 ref)—*English abstract.*

11986. Ehrhardt, Anke A. & Baker, Susan W. (State U New York, Medical School, Buffalo) **Fetal androgens, human central nervous system differentiation, and behavior sex differences.** In R. C. Friedman, R. M. Richart, R. L. Vande Wiele & L. O. Stern (Eds), *Sex differences in behavior*. New York, NY: John Wiley & Sons, 1974. xvi, 495 p.

11987. Ellingson, Robert J.; Dutch, Stephen J. & McIntire, Matilda S. (U Nebraska, Medical Ctr, Omaha) **EEG's of prematures: 3-8 year follow-up study.** *Developmental Psychobiology*, 1974(Nov), Vol 7(6), 529-538.—A classification of apparently normal neonatal EEGs into 4 classes (A-D) on the basis of progressive maturity was devised and applied to 273 EEGs of 117 apparently normal newborns recorded between 24 and 50 wks conceptional age (CA). Both the order in which the 4 classes of EEGs occurred for Ss upon whom more than 1 EEG was obtained, and the distributions of the ages over which the 4 classes were observed confirm that the classes represented a maturational sequence of EEG pattern changes. Of the 81 original premature Ss, 46 underwent comprehensive clinical evaluation between 3 and 8 yrs. Results do not demonstrate the usefulness of the routine EEG as a prognostic indicator in neonates not displaying specific pathology at birth; they do offer some evidence of a relationship between immaturity of the EEG relative to CA in the neonatal period and the later manifestation of congenital disorders involving the brain. (21 ref)—*Journal abstract.*

11988. Forster, Francis M. et al. (U Wisconsin, Epilepsy Ctr, Madison) **Reflex epilepsy evoked by decision making.** *Archives of Neurology*, 1975(Jan), Vol 32(1), 54-56.—Describes the case of a 20-yr-old male patient who had seizures while playing chess or cards or when filling out complex forms, doing complex mathematical problems, and during certain parts of the neuropsychological testing. Seizures were myoclonic and accompanied an EEG dysrhythmia of the atypical spike and wave type. Evoked seizures were not related to visual, tactile, or auditory stimuli or clues. In chess, seizures occurred when he was on the defense and threatened. Simple decision making or physiologic stress did not evoke seizures nor did nonsequential decision making under verbal pressure. Evoking factors were

complex decision making in a sequential fashion and an element of stress or concern regarding the outcome of the decision making. Stimulus was usually nonverbal. 3 major factors—decision complexity, sequential factor, and related stress or concern—may have some reciprocal relationships.—*Journal abstract.*

11989. Froese, Arthur; Hackett, Thomas P.; Cassem, Ned H. & Silverberg, Elizabeth L. (Massachusetts General Hosp, Boston) **Trajectories of anxiety and depression in denying and nondenying acute myocardial infarction patients during hospitalization.** *Journal of Psychosomatic Research*, 1974(Dec), Vol 18(6), 413-420.—Out of 36 acute myocardial infarction patients (9 female, 27 male), 17 were classified as deniers and 19 as nondeniers; all were scored for anxiety, depression, and denial at 6 intervals (Days 1-2, 3-4, 5-7, 8-10, 11-14, and 15-25) during their hospital stay. Anxiety scores, high for both groups on the 1st 2 days, declined more rapidly for deniers. The latter were rated significantly less anxious by Days 3-4, while the nondeniers' level of anxiety remained elevated until Days 5-7. Depression scores dropped for deniers on Days 5-7; nondeniers showed no such change. Denial scores dropped significantly in both groups but occurred sooner for nondeniers (Days 8-10) than for deniers (Days 11-14). The decline of denial followed a fall in anxiety scores; however, denial continued to operate after this fall 3 times longer for the denier.—W. G. Shipman.

11990. Gallart Capdevila, José M. (U Barcelona, Spain) [**Psychological aspects of children suffering from cerebral palsy: Spastic and/or nonspastic.**] (Span) *Anuario de Psicología*, 1973, No 8, 53-71.—Presents a psychological analysis of 600 children with cerebral palsy, patients at a rehabilitation center (mean IQ = 60). Many psychometric and psychoaffective tests were administered. Analysis of results revealed no significant differences between spastic and nonspastic Ss. Therefore results did not support the findings of J. F. Garret and others that spastic Ss have experienced greater anxiety than normal Ss and that athetoid Ss have a greater need of affection and less tolerance of frustration than the normal population. (23 ref)—*English summary.*

11991. Goldman, Herbert et al. (VA Hosp, St Louis, MO) **Correlation of diastolic blood pressure and signs of cognitive dysfunction in essential hypertension.** *Diseases of the Nervous System*, 1974(Dec), Vol 35(12), 571-572.—Studied the relationship between the degree of diastolic hypertension and frequency of errors made on a psychological test sensitive to cognitive dysfunction in a sample of 14 male essential hypertensives. 3 white and 11 black Ss were recruited from the St. Louis Veterans Administration Hospital Outpatient Clinic. Their mean age was 47.6 yrs and their mean educational level 9.3 yrs. None had been previously diagnosed or treated for hypertension. Both a subtest of the Halstead-Reitan Neuropsychological Test Battery for Adults and the WAIS were administered. While the correlation between degree of systolic hypertension and test scores was not significant, the correlation between diastolic hypertension and test score was significant. It is concluded that these findings support the concept that

hypertension has neuropsychological as well as cardiovascular consequences.—*R. S. Albin.*

11992. Gordon, H. W. (Technion-Israel Inst of Technology, Haifa) **Comparison of ipsilateral and contralateral auditory pathways in callosum-sectioned patients by use of a response-time technique.** *Neuropsychologia*, 1975(Jan), Vol 13(1), 9-18.—6 epileptic patients with complete forebrain commissurotomy were used in a vocal response time test to contrast ipsilateral and contralateral auditory pathways. Callosal bisection and use of verbal stimuli and responses ensured exclusive use of the left hemisphere. Consequently, scores for the right and left ears reflected performance by contralateral and ipsilateral pathways, respectively. Simple words were repeated faster, but no more accurately, when presented to the right ear than to the left. Control Ss, including 2 partial commissurotomy patients, 5 normal Ss, and 2 epileptics, showed no ear differences. Nor were there differences on other control tests given to complete commissurotomy Ss. Possible sources for the difference between the ipsilateral and contralateral pathways are discussed. (French & German summaries) (25 ref) —*Journal abstract.*

11993. Grissom, Julie J.; Weiner, Barbara J. & Weiner, Elliot A. (Oklahoma State U) **Psychological correlates of cancer.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 113.—Administered the Recent Life Changes Questionnaire and the Tennessee Self-Concept Scale to 30 male lung cancer patients, 30 male emphysema patients, and 30 male well controls. Data suggest that there are definite indications of distinctive personality characteristics possessed by people who have cancer, which may have been characteristic of those people before their illness.

11994. Gustafson, Lars & Risberg, Jarl. (U Lund Hosp, Sweden) **Regional cerebral blood flow related to psychiatric symptoms in dementia with onset in the presenile period.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(5), 516-538.—Measured regional cerebral blood flow (RCBF) by the intra-arterial <sup>133</sup>Xenon injection technique in 8 regions of the dominant hemisphere in 50 40-65 yr old patients with presenile dementia. Psychiatric ratings on 67 symptoms were factor analyzed, and the 14 factors obtained were correlated to the RCBF variables. 3 factors containing symptoms of pronounced mental deterioration (e.g., amnesia, apraxia, agnosia, and aphasia) showed the largest negative correlations to RCBF, suggesting that the most demented Ss had reduced oxygen metabolism and atrophic cortical changes in these regions. Symptoms of affective or other changes in these regions. Symptoms of affective or other changes of personality in organic dementia were found changes of personality in organic dementia were found in Ss with a relatively better preserved cerebral circulation. Ss with paranoid symptoms had a high grey matter blood flow, especially frontally in combination with decreased flow in the posterior temporal region. It is concluded that the RCBF technique can be applied to measure quantitatively general or regional cerebral dysfunction underlying various forms of dementia. (3 p ref) —*Journal abstract.*

11995. Harley, Randall & Spollen, John. (George Peabody Coll for Teachers) **A study of the reliability and validity of the Visual Efficiency Scale with low vision children.** *Education of the Visually Handicapped*,

1973(Dec), Vol 5(4), 110-114.—The Visual Efficiency Scale (VES), designed to assess visual discrimination of low-vision children, has 48 visual discrimination items grouped in 4 subtests. It was administered to 78 6-8 yr old low-vision children in residential schools. Results indicate that the VES has both content validity and internal consistency. Item analysis shows that most of the test items sufficiently discriminated between high and low scorers. Some items were inappropriately placed according to efficiency rating. Results agreed with those of a previous study with preschool normally-seeing children.—*C. L. Nicholson.*

11996. Hemsley, David. (Inst of Psychiatry, London, England) **Relationship between two tests of visual retention.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1132-1134.—Conducted a retrospective investigation of the relationship between the Revised Visual Retention Test (Administration A) and the Rey-Osterrieth test, used clinically in the assessment of brain damage on 31 patients. Differences between the tests are discussed, and agreement between the tests is noted to be dependent on the cut-off points chosen. Results indicate once again the difficulties inherent in the unitary concept of brain damage.—*Journal abstract.*

11997. Hoffmann, S. O. (Freie U Berlin, Psychiatrische Klinik II, W Germany) **[Reversion of a so-called dermatozoophobia after implantation of a pacemaker: On the problem of symptomatic psychoses in heart disease.]** (Germ) *Nervenarzt*, 1973(Jan), Vol 44(1), 48-51.—Describes 74-yr-old female with congestive heart failure (blood pressure 230/50, pulse rate 40), complex atrial arrhythmias and intermittent atrioventricular (AV) block, with a history of delusions and dermatozoophobia dating back about 2 mo. Neither pulse rate nor psychotic symptoms responded to pharmacologic treatments. After development of complete AV block, transitory spontaneous increases of pulse rate were associated with partial remission of psychopathological symptoms. Implantation of a pacemaker resulted in 160/80 blood pressure, 74 pulse rate, and complete reversion of delusions, with persistence of a mild organic brain syndrome. 2 possible mechanisms for psychosis associated with heart disease are suggested: (a) Up to age 55-60 with presumably only minimal arteriosclerotic changes, severe cardiac decompensation may lead to "absolute" insufficiency of cerebral blood flow; in patients that survive, the psychosis may be termed "cardiogenic." (b) After age 55-60 and with signs of arteriosclerotic changes, severe cardiac decompensation may lead to "relative" insufficiency of cerebral blood flow, and the appropriate label may be "symptomatic circulatory psychosis." (33 ref)—*J. Rutschmann.*

11998. Holland, Audrey L. & Sonderman, Judith C. (U Pittsburgh) **Effects of a program based on the token test for teaching comprehension skills to aphasics.** *Journal of Speech & Hearing Research*, 1974(Dec), Vol 17(4), 589-598.—Designed a programmed training task based on the token test and administered it to 24 left-brain damaged adult aphasic patients. The point at which the failed the token test determined where he began the program and how many training sessions he would receive, provided he did not exceed the error rate before he finished the program. Improvement and errors within

the program were analyzed to evaluate this training. Mildly or mild to moderately impaired Ss showed significant improvement, while moderately and severely handicapped Ss did not. This training, however, did not generalize to other "direction-following" tasks for any group of Ss. Within the program, generalization items were the most difficult for all aphasics. Neither inpatient vs outpatient status nor frequency of training sessions were significantly related to success with this program. The only overlap between groups which emerged in this study involved the youngest S (24 yrs old), whose aphasia was the result of a recent traumatic injury.—*Journal abstract.*

11999. Jerger, Susan & Jerger, James. (Methodist Hosp, Texas Medical Ctr, Houston) **Extra- and intra-axial brain stem auditory disorders.** *Audiology*, 1975(Mar-Apr), Vol 14(2), 93-117.—Compared auditory test results in 28 patients with extra-axial, 11 patients with intra-axial, and 6 patients with combined extra- and intra-axial brain stem disorders. Ss with extra-axial lesions usually demonstrated sensitivity loss, marked adaptation on Békésy audiometry, impairment in maximum percent correct in performance on monosyllabic word lists (PBmax) and auditory symptoms on the ear ipsilateral to the radiographic abnormality. Ss with intra-axial brain stem lesions usually showed slight, if any, sensitivity loss, normal Békésy audiograms, relatively good PBmax scores, and auditory symptoms on both ears or on the ear contralateral to the radiographic disorder. In Ss with combined extra- and intra-axial disorders, auditory findings varied in relation to the extent of extra-axial involvement. (French summary) (41 ref)—*Journal abstract.*

12000. Johns, M. W. (Monash U, Melbourne, Vic, Australia) **Stress and coronary heart disease.** In A. T. Welford (Ed), *Man under stress*. New York, NY: John Wiley & Sons, 1974, 140 p. \$10.95.

12001. Kershner, John R. & King, Audrey J. (Ontario Inst for Studies in Education, Toronto, Canada) **Laterality of cognitive functions in achieving hemiplegic children.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1283-1289.—7 left- and 7 right-hemiplegic 6-9 yr old children were compared with 7 physically normal children on the WISC and Reitan-Indiana Neurological Test Battery. Although the brain-injured Ss were achieving satisfactorily in school and no differences were found among the 3 groups on the Wide Range Achievement Test, the left hemiplegics were poorer than the normals in visuo-perceptual performance, and the right hemiplegics poorer than the normals in verbal intelligence. Results suggest that even in educationally advanced children, compensation for early, asymmetrical brain damage is not complete. Recommendations are made for early assessment of asymmetrical cognitive abilities and differential instructional procedures. (27 ref)—*Journal abstract.*

12002. Ketterings, K. & Korten, J. J. (Neurologische Klinik, Nijmegen, Netherlands) **[Psychological and clinical neurological observations in cases of essential tremor: With introductory brief literature review and concluding comparison between essential and parkinsonian tremor.]** (Germ) *Nervenarzt*, 1973(Jan), Vol 44(1), 19-25.—Presents neurological, personality, and bio-

graphical data on each of 7 males and 1 female with essential tremor and describes differences and similarities between these patients and patients with paralysis agitans. (32 ref)

(Ontario Inst for Studies in Education, Toronto, Canada) **Recreation as one of the needs of the physically disabled.** *Journal of Leisureability*, 1974(Apr), Vol 1(2), 21-28.—Describes the obstacles to social interaction faced by handicapped individuals (e.g., environmental barriers, transportation, and social stigma). Recreation is suggested as an area in which these obstacles could be overcome, permitting the disabled to develop feelings of self-worth and social skills.

12005. Klein, Robert F.; Garrity, Thomas F. & Gelein, Janet. (U Rochester, Medical School) **Emotional adjustment and catecholamine excretion during early recovery from myocardial infarction.** *Journal of Psychosomatic Research*, 1974(Dec), Vol 18(6), 425-435.—Studied 38 patients hospitalized for acute myocardial infarction in a cardiac care unit, using nurses' behavioral ratings, interviews, and bedside observations during the 1st 5 days after admission. Urinary epinephrine (E) and norepinephrine were measured for the same days from 8-hr collections corresponding to the period of behavioral observation. Ss with no adjustment during the study had significantly higher E excretion during the 1st day of hospitalization and on a repression-expression dimension. Rating periods characterized by high expression were associated with lower E excretion than periods characterized by high repression. (35 ref)—*W. G. Shipman.*

12006. Levine, Edna S. & Wagner, Edwin E. (New York U) **Personality patterns of deaf persons: An interpretation based on research with the Hand Test.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1167-1236.—Attempts to breach the stereotyped image of the "deaf personality" and to approach the study of the deaf with an instrument—the Hand Test—not previously used in the creation of that stereotype. Psychological research, measures used, and problems encountered in assessing the effects on personality of early severe deafness are reviewed, and theories concerning ego and superego development, mental functioning, and the role of nonverbal elements of human communication in the growth of the deaf personality are outlined. A description of the Hand Test and an investigation of its use in a study with 4 groups of deaf adults comprising 3 sharply divergent levels of linguistic competence (exceptional, marginal or illiterate, and average of typical high school) are detailed. Statistical findings and basic interpretations of the data from this study show that 20 of 24 Hand Test variables significantly discriminated among the 4 deaf groups. Protocols for administering, interpreting, and using the Hand Test for clinical assessment are described. It is provisionally concluded that, subject to further research and validation, the Hand Test is a useful diagnostic instrument, easily integrated into a battery of psychological tests for evaluating the individual deaf person. 12007. Litman, Theodor J. (U Minnesota, School of Public Health) **The family as a basic unit in health and medical care: A social-behavioral overview.** *Social Science & Medicine*, 1974(Sep), Vol 8(9 10), 495-519. —Reviews the literature on the role of the family in physical illness. It is suggested that future research efforts be directed at (a) developing a more reliable and valid measure of family interaction; (b) determining the impact of illness on the family; (c) investigating family adaptation, adjustment, and response to illness; and (d) exploring home treatment. —*M. E. Pounsel.*

12008. Lucas, Richard A. (VA Hosp, Durham, NC) **A comparative study of measures of general anxiety and death anxiety among three medical groups including patient and wife.** *Omega Journal of Death & Dying*, 1974(Fal), Vol 5(3), 233-243. A problem not yet extensively researched among hemodialysis patients and their families concerns matters of dying and death. This paper presents a comparative study of general and death anxiety among 3 different groups of 20 physically ill males (center and home hemodialysis patients and surgery patients) and their wives. The MMPI, the State-Trait Anxiety Inventory, and Templer's Death Anxiety Scale were administered to all Ss. In addition, a death questionnaire was used in a structured interview setting with dialysis patients and their spouses in their homes. Results show that (a) there were no significant differences between groups in death anxiety; (b) for both hemodialysis groups, wives had higher death anxiety than their husbands; and (c) for all Ss, death anxiety was no higher than that of previous normative samples. Results indicate that serious physical illness does not necessarily lead to heightened death anxiety. (19 ref) —*Journal abstract.*

12009. Mahapatra, S. B. (U Leeds, England) **Psychiatric and psychosomatic illness in the deaf.** *British Journal of Psychiatry*, 1974(Nov), Vol 125, 450-451. —Studied the prevalence of psychiatric and psychosomatic diseases in patients who had become deaf from otosclerosis in adolescence or in adult life. Assessment of 40 control Ss with a hearing loss of 40 db or more in 1 ear and of 49 deaf patients with bilateral hearing loss of 40 db or more, using the Cornell Index N2 Questionnaire and psychiatric interview, showed a significantly higher prevalence of psychiatric illness among the deaf. Among the deaf, depressive illness was found to be the predominant type of psychiatric illness. No significant difference emerged between deaf and control Ss with respect to psychosomatic illness. —*Journal summary.*

One method makes use of an ultrasonic system which quantifies all motor activity. The 2nd method monitors only locational changes; it employs a matrix of electric pressure mats under the carpet. —*Journal abstract.*

12013. Nabelek, Anna K. & Pickett, J. M. (Gallaudet Coll) **Monaural and binaural speech perception through hearing aids under noise and reverberation with normal and hearing-impaired listeners.** *Journal of Speech & Hearing Research*, 1974(Dec), Vol 17(4), 724-739. —Studied speech perception with 5 normal and 5 hearing-impaired college students in a single sound-treated room at reverberation times  $T = .3$  and  $.6$  sec. Binaural and monaural perception through hearing aids was compared in quiet and in the presence of a babble of 8 voices. The speech and noise sources subtended an angle of  $60^\circ$  on a circle 11 feet in radius centered at the S to give an advantage for binaural perception. Binaural gain was taken as the difference in speech-to-noise ratios for the same word-recognition score comparing binaural and monaural results. The average binaural gain was 3 db for normal and 1.5 db for hearing-impaired Ss at both values of reverberation. Only the hearing-impaired Ss showed an advantage for binaural listening in quiet. The small increase in reverberation caused a substantial decrease in word intelligibility. Hearing-impaired Ss performed an average of 7% poorer under the longer reverberation in the presence of noise and also in quiet. Normal Ss performed 15% poorer at longer reverberation only in the presence of masking noise. Data are presented describing the effects of these experimental conditions on perception of certain types of consonants and phonetic features of consonants. (33 ref) —*Journal abstract.*

12014. Oettinger, Leon; Majovski, Lawrence V.; Limbeck, George A. & Gauch, Ronald. **Bone age in children with minimal brain dysfunction.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1127-1131. —53 children (mean age = 8.5 yrs) diagnosed as having minimal brain dysfunction had X-rays of their left wrist and hand for the determination of bone age. All X-rays were read independently by 3 physicians skilled in radiology. The films were read blind (i.e., sex and case numbers but not age were available). The degree of interrater reliability was very high. Bone age for the group was significantly retarded ( $p < 0.01$ ) compared with the standard group's norms. Two-thirds of the Ss with the standard group's norms. No fell below the mean of the standard norms. No correlation was found between bone age and thyroid level. Findings suggest that children diagnosed as having minimal brain dysfunction may be physiologically retarded in their bone age, although marked individual variations remain. The concept of physiological immaturity should be considered by professionals in the education and social planning for the child with minimal brain dysfunction. —*Journal abstract.*

12015. Oleron, P. (U René Descartes, Lab of Genetic Psychology, Paris, France) **[Visual detection of differences by deaf children under simultaneous and successive presentation conditions.]** (Russ) *Defektslogiya*,

1972, No 5, 18-23.—Studied the ability of 31 deaf boys 11-15 yrs old to detect differences between 2 relatively complex illustrations. For 12 pairs of illustrations both cards were presented simultaneously; for 12 other pairs, the 1st and 2nd cards were presented successively. The Ss' performance on these tasks was compared to that of 11-15 yr old hearing Ss in a study by A. Pieron. While deaf and hearing Ss did equally well under conditions of simultaneous presentation, deaf Ss did less well when the stimuli were shown successively. Results are interpreted as indicating that the deaf do not experience a compensatory increase in the quality of their visual perception. The deaf Ss' difficulty with successive discrimination is explained by the presence in this task of a memory factor. Several theories about why the deaf might show a memory deficit are discussed.—*E. C. Koffman.*

12016. **Perenin, M. T. & Jeannerod, M.** (INSERM, Lab de Neuropsychologie expérimentale, Bron, France) **Residual vision in cortically blind hemifields.** *Neuropsychologia*, 1975(Jan), Vol 13(1), 1-7.—Tested residual visual ability in perimetricaly blind regions of the visual field in 8 adult patients (6 with postgeniculate and 2 with pregeniculate lesions) by using patterned afterimages. None of the Ss experienced an afterimage, nor could they detect the shape of the pattern when flashed within their scotoma. Postgeniculate lesioned Ss, however, were able to point the finger at the origin of the flashes with good accuracy, although those with pregeniculate lesions could not. (French & German summaries) (22 ref)—*Journal abstract.*

12017. **Pöppel, Ernst & Shattuck, Stefanie R.** (Max Planck Inst for Psychiatry, Munich, W Germany) **Reading in patients with brain wounds involving the central visual pathways.** *Cortex*, 1974(Mar), Vol 10(1), 84-88.—Investigated the reading ability of 22 patients with penetrating head injury. In 12 Ss the injury had affected the central visual pathways, producing visual field defects; the remaining 10 had suffered lesions in more anterior parts of the brain not involving visual functions, and these Ss were used as a control group. The task was to read aloud 56 short sentences, presented not only in the usual format from left to right, but also in 7 other directions, around the clock. Although none of the patients with visual field defects complained of reading difficulties in daily life, their reading times for sentences presented in this fashion were twice as long as those of the control group. Reading time was not affected by the presence of a blind area in the reading direction.—*R. Gunter.*

12018. **Pritchard, Michael.** (London Hosp Medical Coll, England) **Meaning of illness and patients' response to long term haemodialysis.** *Journal of Psychosomatic Research*, 1974(Dec), Vol 18(6), 457-464.—Further observations on the meaning of illness to 5 male and 9 female patients undergoing long-term hemodialysis were made using a semantic differential along with the Response to Illness Questionnaire (RIQ). Analysis of the combined data produced 12 dimensions of meaning and/or response to illness (accounting for 99% of the total variance). These ranged from challenging appraisal/informed tolerance to self-involvement/positive acceptance. It is proposed that ratings on these dimensions

will relate to supposed determinants and outcome of illness.—*W. G. Shipman.*

12019. **Quarrington, Bruce & Solomon, Barbara.** (York U, Toronto, Ontario, Canada) **A current study of the social maturity of deaf students.** *Canadian Journal of Behavioural Science*, 1975(Jan), Vol 7(1), 70-77.—Administered the Vineland Social Maturity Scale to profoundly and prelingually deaf 5-16 yr olds. 40 Ss attended day school and 75 were in residential programs with frequent or rare home visits. In institutionalized Ss, the social maturity quotients derived from residential informants were significantly lower than those obtained from parental informants and were not significantly correlated. Social maturity quotients derived from parental interviews were found to be related to type of educational program and to be lowest for children in residential programs who visited their homes infrequently. (French summary)—*Journal abstract.*

12020. **Quigley, S. P.; Wilbur, R. B. & Montanelli, D. S.** (U Illinois, Inst for Research on Exceptional Children) **Question formation in the language of deaf students.** *Journal of Speech & Hearing Research*, 1974(Dec), Vol 17(4), 699-713.—422 10-18 yr old deaf students and 60 hearing 3rd, 4th, and 5th graders responded to and judged the grammaticality of yes-no questions, wh-questions, and tag questions. Results indicate improvement with increasing age for deaf Ss. Even the youngest hearing Ss consistently obtained higher scores than most of the deaf. Yes-no questions were easier to comprehend and judge the grammaticality of than were wh-questions, which, in turn, were easier than tag questions. The acceptability of question variants, such as "Who did the boy hit the girl?" (copying) is also reported.—*Journal abstract.*

12021. **Sarachan-Deilly, Ann B. & Love, Russell J.** (Vanderbilt U, Medical School, Div of Hearing & Speech Sciences) **Underlying grammatical rule structure in the deaf.** *Journal of Speech & Hearing Research*, 1974(Dec), Vol 17(4), 689-698.—Conducted a study using A. B. Sarachan's (1971) measure for assessing underlying language structure in the deaf. The rule-bound organization of the syntactic subcomponent of deep structure was investigated in 42 15-19 yr old congenitally deaf students with no known formal oral language stimulation prior to entering school and with 21 15-18 yr old normal-hearing high school students. Evidence suggests that deep structural differences in syntactic rules exist between congenitally deaf and hearing individuals. The evidence is interpreted as suggesting that these differences exist regardless of the method used in school to teach the deaf language, when the benefits derived from formal preschool language exposure are denied them. (29 ref)—*Journal abstract.*

12022. **Segers, Marie-Jeanne & Mertens, Charles.** (U Louvain, Ctr d'Etudes psycho-médico-sociales, Belgium) **Psychological and bioclinical CHD risk factors: Quantitative differences between obese, normal and thin subjects.** *Journal of Psychosomatic Research*, 1974(Dec), Vol 18(6), 403-411.—To clarify the etiological role played by obesity in coronary heart disease, 1,694 men in 2 age groups (over and under 45) and 3 weight categories (thin, normal, and obese) were given the Anxiety and the Depression Self-Rating Scales of the Institute for

**Personality and Ability Testing.** They were then compared on a number of bioclinical variables. Obese Ss, both under and over 45, exhibited higher bioclinical risks, but lower anxiety and depression, than normal and thin Ss. It is suggested that anxiety, depression, and their style of expression are key elements in the relationship between relative weight and proneness to coronary heart disease. (37 ref)—*W. G. Shipman.*

12023. **Sher, Abigail B.** (Michigan State U) **Factor-defined abilities in patients with unilateral brain lesions.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 101.—Administered a battery of 4 tests adapted from the structure of intellect model of differential abilities to 72 adults with right and left cerebral lesions and normals. Findings show that both brain-damaged groups exhibited slower response times than normals and that there was a relation between locus of the lesion and performance. However, results do not sufficiently demonstrate the advantage of factor-defined ability tests over tests of global intelligence and question the validity of these factor-defined tests in that they do not distinguish behaviors that are factorially distinct in normal populations.

12024. **Sher, Annabelle E. & Owens, Elmer.** (U California, Medical Ctr, San Francisco) **Consonant confusions associated with hearing loss above 2000 Hz.** *Journal of Speech & Hearing Research*, 1974(Dec), Vol 17(4), 669-681.—Presented a 100-item test for the identification of phonemes to 2 groups of listeners: 35 adult patients with normal hearing up to 2,000 Hz accompanied by a high-tone loss and 28 adults with normal hearing who heard the speech stimuli presented through a low-pass filter with a cutoff at 2,040 Hz. There were no significant differences between the 2 groups in overall scores, in probabilities of error for individual phonemes, or in the kinds of error substitutions made. Findings show that (a) the overall scores indicated difficulty in phonemic identification and (b) the phonemes substituted for the stimulus phonemes in the initial position were the same in manner of articulation as the stimulus phoneme, and typically only 1 confusion occurred per stimulus phoneme. The phonemes substituted for the stimulus phonemes in the final position were not necessarily the same in manner of articulation as the stimulus phoneme, and more than 1 confusion generally occurred for each stimulus phoneme. (19 ref)—*Journal abstract.*

12025. **Sohmer, H.; Feinmesser, M. & Szabo, G.** (Hebrew U, Hadassah Medical School, Jerusalem, Israel) **Sources of electrocochleographic responses as studied in patients with brain damage.** *Electroencephalography & Clinical Neurophysiology*, 1974(Dec), Vol 37(6), 663-669.—Attempted to find corroborating evidence for the brain-stem origin of the set of 5 waves recorded from the ear lobe and vertex in both human and animal (cat) Ss. A comparison of electrocochleographic responses with clinical evidence in patients with various types of brain-stem tumors confirm the existence of brain-stem lesions and show that the 1st wave represents the response of the auditory nerve and that the later 4 waves are generated in the auditory nuclei. (French summary) (16 ref)

12026. **Spence, Michelle & Feth, Lawrence L.** (U Southern Mississippi) **Effects of off-frequency detection in brief-tone audiometry.** *Journal of Speech & Hearing Research*, 1974(Dec), Vol 17(4), 576-588.—Cites studies of auditory temporal integration by pathological ears which have used listeners with an abrupt high-frequency hearing loss. While this configuration may lend itself to use of the listener as his own control, it presents the opportunity for detection of the low-frequency energy of the brief-tone bursts. The present study assessed the role of low-frequency energy in the determination of brief-tone thresholds of 6 adult male listeners with abrupt high-frequency losses due to cochlear pathology. 6 normal-hearing adult males also served as Ss. Low-frequency energy was reduced to subthreshold levels by passing the brief tones through a filter system which had a sharp high-pass characteristic. For both normal and impaired Ss, no significant differences in threshold were found between filtered and unfiltered brief tones. It is concluded that, although the opportunity for off-frequency detection was present, the abnormal temporal integration functions could not be attributed to stimulus artifact.—*Journal abstract.*

12027. **Stendig-Lindberg, G.** (Karolinska Inst, Stockholm, Sweden) **Hypomagnesaemia in alcohol encephalopathies.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(5), 465-480.—Examined serum magnesium concentrations in patients with acute delirium tremens and patients with a diagnosis of alcohol encephalopathy (AE). Results indicate that a combination of hypomagnesaemia with delirium-predelirium tremens is of etiological significance for the occurrence of AE, which develops as a sequel to delirium tremens. (43 ref)

12028. **Sussman, Harvey M. & MacNellage, Peter F.** (U Texas, Austin) **Hemispheric specialization for speech production and perception in stutterers.** *Neuropsychologia*, 1975(Jan), Vol 13(1), 19-26.—Tested 25 right-handed and 3 left-handed 16-41 yr old stutterers on presumed indices of hemispheric specialization for speech production (pursuit auditory tracking) in Exp I and for speech perception (dichotic listening) in Exp II. 19 of the original sample plus one additional S served in Exp II. Previous studies of normal Ss have revealed a significant right ear advantage (REA) for tracking with a speech articulator but not with manual tracking. Stutterers showed no significant REA in either tracking condition but did show a significant REA, similar to that of normal speakers, in dichotic listening. Results are considered to differentiate this population of stutterers from normals in terms of hemispheric specialization for speech production but not for speech perception. (French & German summaries) (29 ref)—*Journal abstract.*

12029. **Tonkin, Roger S.; Robinson, Geoffrey C. & Kinnis, Claire.** (U British Columbia, Vancouver, Canada) **A study of kindergarten children in three socioeconomic areas of British Columbia.** *Health Services Reports*, 1973(Dec), Vol 88(10), 947-955.—Surveyed 279 kindergarten children and their families in 3 socioeconomic areas of British Columbia, examining a wide variety of health, social, and economic variables. Methods included physical and psychological examinations, anthropometric and laboratory measurements of the children, and interviews with the parents. Families of early registrant

for kindergarten showed distinct differences from families of late registrants and Indians. Late registrants and Indians were more likely to come from a family experiencing social and economic hardship. Such children had more severe dental disease, more frequent infection of skin, tonsils, and ears, and poorer school attendance and performance than their counterparts in the rest of British Columbia.—*Journal summary.*

12030. van der Linden, E. [Children with minimal brain dysfunction.] (Duth) *Nederlands Tijdschrift voor de Psychologie en haar Grensgebieden*, 1974(Nov), Vol 29(8), 601-630.—Presents the symptoms of minimal brain damage (MBD) among children. Neurological examination usually fails to indicate any anatomical or physiological disorders. Symptoms are varied: difficulties in training situations, unstructured behavior patterns, restlessness, inferior ability to differentiate among patterns of emotionalized behavior, difficulties in attentive behavior, high suggestibility, overreacting, and low frustration tolerance. The patient is characterized by a short attention span, disturbed space- and figure-ground perception, inadequate eye-hand coordination, clumsiness, obstinacy, ego-weakness and accident-proneness. The disorder is generally based on difficulties in perceptual differentiation, central inhibition, and integration. Although no standardized tests have been specifically constructed to identify the MBD child, some tests provide supporting evidence of the condition. Therapeutic measures include play therapy, operant conditioning, adult counseling, creative group therapy, speech training, motor therapy, and pharmacological therapy. (63 ref)—A. J. Ter Keurst.

12031. Waldton, Stig. (Beckomberga Hosp, Bromma, Sweden) **Clinical observations of impaired cranial nerve function in senile dementia.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(5), 539-547.—Studied cranial nerve functions in 66 females with a diagnosis of senile dementia (mean age = 79 yrs). The study included a preliminary investigation and a 3-yr longitudinal study. The diagnoses in all Ss were later followed up at the autopsies. The clinical investigations were also carried out on 50 control cases. Results show a marked functional impairment of certain cranial nerves in senile dementia (particularly olfactory and gustatory nerves), which occurred relatively early in the disease and progressed with the course of the disease. The Ss differed markedly from the control group where only mild impairment of cranial nerve function occurred and no progression could be demonstrated.—*Journal abstract.*

12032. Yoshino, Tomoyoshi. (Tokyo U of Education, Japan) **A study of the cognition of deaf children: The developmental study by multiplicative classification.** *J (Japn) Japanese Journal of Special Education*, 1974(Jun), Vol 12(1), 33-42.—108 deaf children and 82 hearing children of chronological age (CA) 4-7½ yrs, with intelligence above average served as Ss in a 12-item matrix test, individually administered, with 2 or 3 dimensions in each matrix. Scores increased significantly with increasing age for both groups. At CA 5 the mean score was significantly higher for hearing than for deaf children. At CA 6 and 6½ the hearing group showed a paradoxical decline, indicating a transition from perceptual to conceptual response, which occurred at CA 6½

and 7 in deaf children. In concept formation, deaf children seemed to depend on perceptual elements longer than hearing children, who acquire a symbolic system through verbal functioning. (English summary)—S. Ohwaki.

## TREATMENT AND PREVENTION

12033. Anderson, J. A.; Basker, M. A. & Dalton, R. (Guy's Hosp Medical School, London, England) **Migraine and hypnotherapy.** *International Journal of Clinical & Experimental Hypnosis*, 1975(Jan), Vol 23(1), 48-58.—Compared the treatment of migraine by hypnosis and autohypnosis with the treatment of migraine by the drug prochlorperazine (Stemetil). Random allocation of 47 patients was made to one or other prophylactic measure, followed by monthly assessments and independent evaluation of 1 yr of continuous care. Criteria of improvement were the number of attacks/month, number who had Grade 4 attacks, and complete remission. Results show that the number of attacks and the number who suffered blinding attacks were significantly lower for the group receiving hypnotherapy than for the group receiving prochlorperazine. For the group on hypnotherapy, these 2 measures were significantly lower when on hypnotherapy than when on previous treatment. Prochlorperazine seemed about as effective as previous treatment. 10 out of 23 patients on hypnotherapy achieved complete remission during the last 3 mo of the trial, compared to only 3 out of 24 on prochlorperazine. It is concluded that further trials of hypnotherapy are justified against some other treatment not solely associated with the ingestion of tablets. (German, French, & Spanish summaries)—*Journal abstract.*

12034. Angelergues, René [Paradoxes in psychiatry: Books that challenge psychiatry and its institutions.] (Fren) *Evolution Psychiatrique*, 1972(Jan), Vol 37(1), 5-40.—Compares psychiatry with anti-psychiatry, the new doctrine which seeks to have the mentally ill live in the social order at any cost; in fact it denies the reality of the entire concept of "mental illness." Psychiatry, despite its difficulties, is still the most promising way to unify mental and bodily functioning; anti-psychiatry borders on science fiction. (21 ref)

12035. Barte, H. (Psychiatric Hosp, Bonneval, France) **[Anti-psychiatry: Political discourse.]** (Fren) *Evolution Psychiatrique*, 1972(Jan), Vol 37(1), 41-48.—Contends that the motives and orientation of anti-psychiatry are political, not scientific. It claims that psychiatry's purpose in locking up the insane is merely to protect the interests of the established order. Its popularity comes not from successful treatment of patients but from its position of denial and its capacity to provoke.

12036. Bennett, Clint. (Madison Coll) **Speech pathology and the hearing impaired child.** *Volta Review*, 1974(Dec), Vol 76(9), 550-557.—Discusses the role of the speech therapist in dealing with hearing-impaired children, from initial assessment of language skills through development of training programs for home use.

12037. Best, J. Allan. (U British Columbia, Vancouver, Canada) **Tailoring smoking withdrawal procedures**

to personality and motivational differences. *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 1-8.—Used concentrated cigarette smoke as an aversive agent in the treatment of 89 habitual cigarette smokers. A factorial design assessed the incremental efficacy of 3 procedures, hypothesized to increase treatment durability, as a function of client characteristics. The 1st, treatment focus, contrasted procedures considered optimal for internal vs external locus of control clients (measured with Rotter's Internal-External Control Scale). The 2nd, punishment, assessed an instruction to punish postclinic smoking with stimulus satiation conditions. The 3rd, timing of attitude change, presented an attitude change manipulation either before or after behavior change. The Eysenck Personality Inventory and C. S. Keutzer's effective cognitive dissonance measure were also administered. Changes in smoking behavior were monitored over a 6-mo period. 2 of the 3 treatment factors, treatment focus and timing of attitude change, interacted significantly with client characteristics in determining treatment outcome. Findings support the principle of tailoring therapeutic procedures to individual differences. (25 ref)—*Journal abstract*.

12038. Coleman, Sara L. & Stedman, James M. (San Antonio Children's Ctr, TX) **Use of a peer model in language training in an echolalic child.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Dec), Vol 5(3-4), 275-279.—Describes the technique used with a 10-yr-old female diagnosed as autistic with chronic schizophrenic reactions. She was trained to speak in a normal voice volume and acquired a labeling vocabulary, via an imitation learning paradigm which utilized a peer model. Results indicate that the modeling paradigm facilitated both volume training and label acquisition.—*Journal abstract*.

12039. Cull, John G. & Hardy, Richard E. (Eds.). (Virginia Commonwealth U, Regional Counselor Training Program, Fishersville) **Behavior modification in rehabilitation settings: Applied principles.** Springfield, IL: Charles C Thomas, 1974. xvii, 251 p.—Presents a collection of 11 papers aimed at helping the newly employed professional person explore basic concepts of behavior modification that are used in rehabilitation work. Topics include a description of token economies, modeling in prevocational training, behavioral group therapy with alcohol abusers, and self-modeling as a behavior modification technique.

12040. Deeble, J. S. (Monash U, Faculty of Economics & Politics, Clayton, Vic, Australia) **The economic approach to family health studies.** *Social Science & Medicine*, 1974(Sep), Vol 8(9-10), 529-533.—Examines factors that influence family decision-making concerning external health care services. It is suggested that a concept of family in terms of constituent "income units" would be preferable for economic studies. Statistical requirements are outlined.

12041. Ernst, K. (Psychiatrischen Universitätsklinik Zürich, Switzerland) **[The Burghölzli today.]** (Germ) *Schweizer Archiv für Neurologie, Neurochirurgie und Psychiatrie*, 1973, Vol 112(1), 41-48.—Reports on new developments at the Burghölzli Psychiatric Clinic of the University of Zürich. Topics include inpatient and outpatient capacity; aspects of the therapeutic communi-

ty (e.g., open door policy, work therapy, coeducational activities and programs, and patient participation in administrative and organizational matters); postgraduate training; and research work.—T. Fisher.

12042. Ey, Henri. **[Anti-anti-psychiatry, or the progress of psychiatric science.]** (Fren) *Evolution Psychiatrique*, 1972(Jan), Vol 37(1), 49-67.—Critiques anti-psychiatry as a purely negative ideology, much worse than the "psychiatric mythology" which it denounces. Some of its negative theses are specified; it is anti-nosography, anti-institution, and anti-therapy. Constructive suggestions for defending the anti-anti-psychiatry position are offered.

12043. Fucci, Donald J.; Curtis, Ann P. & Harnack, Martha M. (Ohio U, School of Hearing & Speech Sciences) **Oral vibrotactile stimulation: A method for monitoring change in lingual sensitivity as a function of time.** *Bulletin of the Psychonomic Society*, 1974(Dec), Vol 4(6), 573-574.—Describes assessment procedures used to monitor the change in lingual sensitivity of a 40-yr-old partial glossectomized female over a period of time. Oral vibrotactile thresholds were obtained from the right, midline, and left sections of the anterior dorsum of the tongue once a week for 7 wks while the S was receiving speech therapy. Improvement in sensitivity was noted for all 3 lingual sections. Implications for using oral vibrotactile threshold measurements for monitoring purposes are discussed.—*Journal abstract*.

12044. Goodkin, Robert. (New York U, Medical Ctr, Inst of Rehabilitation Medicine) **Modifying behavior: Applied techniques.** In J. G. Cull & R. E. Hardy (Eds.), *Behavior modification in rehabilitation settings: Applied principles.* Springfield, IL: Charles C Thomas, 1974. xvii, 251 p.

12045. Greenblatt, Milton. (VA Hosp. Psychiatry Service, Sepulveda, CA) **Psychiatry: The battered child of medicine.** *New England Journal of Medicine*, 1975(Jan), Vol 292(5), 246-250.—Traces the historical development of psychiatry, from the "moral treatment" precipitated by the French Revolution, through the Industrial Revolution, to today's criticisms of the science. The criticisms against psychiatry include imprecise diagnoses, conceptual vagaries, jargon, therapeutic impotence, and class bias. It is pointed out that skills involved in the practice of psychotherapy are not unique to the profession, and that social ills, over which psychiatry has little control, play a large part in causing mental disability and retardation. Despite these charges, it is suggested that psychiatry has contributed to medical practice and to the humane consciousness of society. (17 ref)—*Journal abstract*.

12046. Herberger, L. **The demographic approach to the study of family health.** *Social Science & Medicine*, 1974(Sep), Vol 8(9-10), 535-544.—Analyzes the kinds of demographic data (population censuses, population sample surveys, statistical evaluations of population registers, and vital statistics) relevant to the study of family health and the implications of each method. (20 ref)

12047. Hult, Lloyd M. & Irwin, Ruth B. (Illinois State U) **Evaluation and multiple stimulation in the stimulus-response paradigm of articulation therapy.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1055-1061.—Con-

ducted a study with 60 normal-hearing and speaking college students in which the effects of evaluation and multiple stimulation, and changes in the natural latency between stimulus and response were observed. Results indicate that evaluation improved the effectiveness of the method, that multiple stimulation was more effective at the beginning of the learning task while single stimulation was more effective during the final modification stages, and that latency tended to decrease as responses became more accurate. (15 ref)—*Journal abstract*.

12048. Jungjohann, Eugen E. [Research and treatment of various forms of mental subnormality in the Soviet Union: Report on a trip to Leningrad and Moscow to study child psychiatry.] (Germ) *Nervenarzt*, 1973(Jan), Vol 44(1), 52-53.—Describes various aspects of child mental health care in Moscow and Leningrad, including the work of the Institute of Defectology, theoretical models under consideration, responsibilities of government ministries, diagnostic methods, dispensaries, special kindergartens and schools, etc. It is estimated that 1% of children under 16 in Moscow are oligophrenic. The findings of Ivanov and Pevzner on mental disability are summarized.

12049. Kiev, Ari (Ed.). (Columbia U. Coll of Physicians & Surgeons) *Magic, faith, and healing: Studies in primitive psychiatry today*. New York, NY: Free Press, 1974. xvii, 475 p. \$2.95.—This series of readings explores the beliefs, rituals, and symbols of primitive societies which are intended to heal the mentally ill. Topics include the psychotherapeutic aspects of shamanism, and patterns of psychiatric care in developing African countries.

12050. Kiev, Ari. (Columbia U. Coll of Physicians & Surgeons) *The study of folk psychiatry*. In A. Kiev (Ed), *Magic, faith, and healing: Studies in primitive psychiatry today*. New York, NY: Free Press, 1974. xvii, 475 p. \$2.95.

12051. Mauksch, Hans O. (U Missouri) *A social science basis for conceptualizing family health*. *Social Science & Medicine*, 1974(Sep), Vol 8(9-10), 521-528.—Discusses the implications of the increasing prevalence of emerging programs in family health care and the growing popularity of family medicine as an area of commitment for physicians in the US. A review of the background of family medicine, and a juxtaposition of the medical model and a construct of the family, suggest that the acceptance of the family as a target for health evaluation and health care requires serious reassessment of traditional practices. (55 ref)—*Journal abstract*.

12052. Maurel, Henri. ["Anti-psychiatry": Reflections on terminology and theme.] (Fren) *Evolution Psychiatrique*, 1972(Jan), Vol 37(1), 73-82.—Points out semantic inconsistencies and other flaws in the neologism, "anti-psychiatry." 7 major themes of the doctrine are critically discussed. The real nature and significance of anti-psychiatry are examined, and the need to demystify it is emphasized.

12053. May, Philip R. & van Putten, Theodore. (U California, Neuropsychiatric Inst, Los Angeles) *Treatment of schizophrenia: II. A proposed rating scale of design and outcome for use in literature surveys*. *Comprehensive Psychiatry*, 1974(Jul-Aug), Vol 15(4), 267-275.—Presents a scale for assessing the degree of

confidence with which the findings of a particular treatment outcome study can be applied to the clinical treatment of schizophrenia. Studies are first classified according to experimental design into 6 categories and then divided by execution of the study and analysis of the results. Detailed descriptions of the categories are presented. Tests measuring interrater agreement using the scale are cited, indicating that it may have sufficient discriminating ability to be a useful instrument.—R. Tomasko.

12054. McEwan, Peter J. (Fearadar House, Crathie, Scotland) *The social approach to family health studies*. *Social Science & Medicine*, 1974(Sep), Vol 8(9-10), 487-493.—Presents a psycho-sociological approach to using the family as a unit in health studies. 5 principal areas are covered: an examination of possible sources of information for a family oriented approach to the study of health and disease; an examination of the implications of recent developments in statistical methods and techniques; the formulation of guidelines and recommendations for the revision of standard vital and medical records; the discussion of various types of statistical studies and surveys required for expanding knowledge of the family regarding health status and patterns; and the identification of major gaps in statistical techniques and information. (54 ref)—M. E. Pounsel.

12055. Miller, F. J. (U Newcastle upon Tyne, England) *The epidemiological approach to the family as a unit in health statistics and the measurement of community health*. *Social Science & Medicine*, 1974(Sep), Vol 8(9-10), 479-482.—Discusses family health as a means of bringing a new dimension to measurement of community health and well-being. The development of a series of indices of family health "state" is suggested, which are susceptible to statistical treatment.

12056. Nielsen, Hans O. (Sct Stefan Guidance Ctr, Copenhagen, Denmark) [Treatment of acute behavior problems.] (Danh) *Skolepsykologi*, 1975, Vol 12(1), 17-22.—Presents the cases of 2 14-yr-old Ss, a girl and a boy, where traumatic changes in living conditions resulted in severe behavioral reactions. Support and coordinated interest from adults was sufficient for improvement, and removal from the milieu was contraindicated.

12057. Peršić, Nikola. [Social psychiatric trends in the psychiatric services in Yugoslavia.] (Srer) *Anali Zavoda za Mentalno Zdravlje*, 1972, Vol 4(2), 69-81.

12058. Pulver, Sydney E. & Pulver, Mitchell P. (Inst of the Pennsylvania Hosp, Philadelphia) *Hypnosis in medical and dental practice: A survey*. *International Journal of Clinical & Experimental Hypnosis*, 1975(Jan), Vol 23(1), 28-47.—Interviewed 101 professionals who were alumni of a course in medical and dental hypnosis. 75% used some hypnotic technique, either formal or informal, in their practice. The predominant technique was direct and indirect hypnotic symptom removal. A wide range of indications was described, the most frequent of which were obesity, anxiety, pain and discomfort, and excessive smoking. Illustrative cases are included. Few doctors encountered either difficulties with colleagues or complications with patients. Of those doctors who did not use hypnosis, the major reasons

mentioned were time, patient's unrealistic expectations and feelings of discomfort, lack of skill, and skepticism about hypnosis. The most striking finding was the efficacy of the course in causing enduring changes in the ongoing pattern of practice of a remarkably high percentage of the doctors. (German, French, & Spanish summaries)—*Journal abstract*.

12059. Reichman, Walter. (Bernard M. Baruch Coll, City U New York) **Conflict and cooperation among departments and agencies working in alcohol and drug abuse.** In *Selected papers delivered at The Ninth Annual West Virginia School on Alcohol and Drug Abuse Studies, June 17-22, 1973*. Morgantown, WV: West Virginia University, 1973. 165 p.

12060. Schafer, Donald W. (U California, Irvine) **Hypnosis use on a burn unit.** *International Journal of Clinical & Experimental Hypnosis*, 1975(Jan), Vol 23(1), 1-14. Used hypnosis with 20 severely burned patients on a modern burn unit. 14 of the patients were benefited in the control of pain, especially during dressing changes. Half of these were either somnambulists or were capable of enough depth to control pain posthypnotically. The other half were benefited during the state of hypnosis even though their level was around 3 on a scale of 5. This 2nd half of "successes" found relief via a personalized recording when the author was not present. The 6 failures were, with 1 exception, under 21 yrs old. Morale, regression, and ward adjustment were improved by the presence of the author as both a psychiatrist and a hypnotist. (German, French, & Spanish summaries)—*Journal abstract*.

12061. Sluzki, Carlos E. (San Francisco General Hosp, Family Health Ctr, CA) **On training to "think interactionally."** *Social Science & Medicine*, 1974(Sep), Vol 8(9-10), 483-485.—Describes the approach used by a family health center in attempting to reduce contradictory messages in its training program and its inherent structure.

12062. Stollberg, Dietrich. **[Ministerial work in the therapeutic team.]** (Germ) *Dynamische Psychiatrie*, 1974, Vol 7(1), 58-67.—Discusses the important role of clergymen in psychiatric hospitals, their cooperation with therapeutic teams, their integration into the therapeutic community, and their diagnostic, therapeutic, communicative, and hermeneutic functions. West Germany's 4 centers for Clinical Pastoral Training and Education, their organization, and their work are described briefly. (English summary)—T. Fisher.

### Psychotherapy & Psychotherapeutic Processes

12063. Adler, M. (Facharzt für Psychiatrie, Berlin, W Germany) **[The relationship between psychotherapy and the natural sciences.]** (Germ) *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 428-432.—Examines the popular usage of the term "psychotherapy" and the methods of thinking and concepts of the natural sciences which are defined as pragmatic and positive. The which are defined as pragmatic and positive. The historical development of psychotherapy is traced from its late 19th century contrast with the natural sciences to the present state, where a dual system exists between the 2. The 2 approaches include insight, hypnotism, and nonverbal methods, as contrasted with technical, me-

thodically oriented, and verbal analysis methods.—R. Tomasko.

12064. Atanassov, A. et al. **First symposium of socialistic countries on psychotherapy.** *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 350-354.—Reviews the 1973 Prague Symposium discussing the problems of psychotherapy in the socialist social order and planning for increased coordination of psychotherapeutic activities among socialist nations. A joint memorandum on development of psychotherapy in socialist countries is presented in German.

12065. Bastiansen, Stein. (Oslo Mental Hosp, Denmark) **Psychotherapy and the autonomy of the individual.** *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 399-404.—Discusses the ethical implications and negative potentials of psychotherapy. Issues covered include the creation of models of the extension of power over other people, the therapist's use of manipulative strategies, restoration of a patient's sense of mastery, and the difficulties in drawing inferences from theory as to the actual behavior of an individual therapist. It is proposed that the therapist accept the right of the patient to preserve and develop his/her autonomy. Therapies leaning heavily on ideological foundations are assumed to imply possibilities for dogmatic attitudes and interference with the interests of some patients.—R. Tomasko.

12066. Benedetti, G. (Psychiatrische Universitätsklinik, Basel, Switzerland) **What is psychotherapy of psychosis?** *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 327-336.—Discusses the psychotherapeutic treatment of psychosis and uses comments about the structure of psychotherapeutic interventions to describe the structure of schizophrenia. This type of therapeutic relationship results in the therapist's counter-identification with his/her patients and a readiness to assume the burden of their psychotic existence. Interpretations of psychotic experiences are viewed as organizing the split self into a whole, and the necessity for the therapist reaching the patient within his/her symptoms is stressed. The analysis is characterized as unbundling and ego-strengthening for the patient, and as a period of unconscious dream and fantasy involvement for the therapist.—R. Tomasko.

12067. Berger, Werner P. **[Parent participation in inpatient psychotherapy for children and juveniles.]** (Germ) *Praxis der Kinderpsychologie und Kinderpsychiatrie*, 1974(Aug-Sep), Vol 23(6), 193-202.—Argues for a working alliance between therapist and parents in inpatient child psychotherapy in order to guarantee cooperation during therapy and continued progress after discharge. Before admitting a child to a treatment home the therapist should consider the following points: (a) What are the parents' motives for having the child admitted to a home? (b) What are their expectations? (c) How is the child's problem interwoven into the family history? (d) How flexible is the participation of the parents? Various forms of parental participation during a child's stay in a home are described. (English summary) (28 ref)—H. A. Euler.

12068. Beutler, Larry E. et al. (Baylor Coll of Medicine, Houston, TX) **Attitude similarity and therapist credibility as predictors of attitude change and improvement in psychotherapy.** *Journal of Consulting &*

*Clinical Psychology*, 1975(Feb), Vol 43(1), 90-91.—Assessed the effects of therapist credibility and patient-therapist similarity (measured by the Situational Appraisal Inventory) on interpersonal persuasion and the relationship between patient attitude change and psychotherapy outcome. Data from 97 psychiatric patients and their 6 therapists suggest that initial patient-therapist similarity is inversely related to the therapist's persuasive influence, regardless of his perceived credibility.

12069. Blomquist, Karen & Blomquist, Kal. [An introduction to Gestalt therapy.] (Swed) *Psykisk Hälsa*, 1972, Vol 13(2), 114-126.

12070. Bowers, Kenneth S. (U Waterloo, Ontario, Canada) **The psychology of subtle control: An attributional analysis of behavioural persistence.** *Canadian Journal of Behavioural Science*, 1975(Jan), Vol 7(1), 78-95. Reports results of 2 experiments suggested by attribution theory, using a total of 65 undergraduates with high scores on the Harvard Group Scale of Hypnotic Susceptibility. Results of both experiments confirm the hypothesis that relatively subtle (i.e., unrecognized) control over behavior may be an important antecedent of its posttreatment persistence. Under certain S conditions, this persistence was undone by contingent reinforcement of the behavior already under subtle (i.e., posthypnotic) control. This debilitating impact of reinforcement may have been due to S's reactance against it, or possibly to their misattribution of behavior to the reinforcement. The psychotherapeutic implications of these and other similar findings are discussed. (French summary) (25 ref)—*Journal abstract*.

12071. Boyer, L. Bryce. (U New Mexico, Project for Field Research in Anthro-Psychoanalytic Techniques) **Folk psychiatry of the Apaches of the Mescalero Indian reservation.** In A. Kiev (Ed), *Magic, faith, and healing: Studies in primitive psychiatry today*. New York, NY: Free Press, 1974, xvii, 475 p. \$2.95.

12072. Branzel, Petre P. ("Socola" Clinic, Iasi, Romania) **Reflections on the significance of psychotherapy in contemporary medicine.** *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 460-464.—Emphasizes the dynamic, unitary character of psychiatry within the framework of contemporary medicine. The procedures of psychotherapy are viewed as complements of those of biological therapy. The works of J. Sournia, W. Bickmayer, J. Delay, A. Requet, and D. Danielopolu are reviewed. Psychotherapy is considered a determining attribute of medicine, and the fusion of psychiatry and psychology is expected to significantly commit society to the defense of its own mental health.—*R. Tomasko*.

12073. Chewick, Richard D. (Northwestern U, Medical School) **The special theory of psychotherapeutic interaction.** *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 433-438.—Outlines a theory of psychotherapeutic interaction that recognizes there is more to psychotherapy than the uncovering of unconscious material. The psychic field and the deep inner attitude of the therapist are viewed as critical to the patient-therapist relationship. Aspects of therapeutic interaction are described both in terms of scientific language (ego operations, countertransference structure, etc) and the language of humanistic imagination (self-actualization, I-Thou relationships, etc). The conflicts between opposing schools of

psychotherapy are said to be based in the usage of these 2 types of language to describe similar empirical data. The therapist is encouraged to be familiar with both types and to be able to shift from one to another.—*R. Tomasko*.

12074. Condrau, Glon. (Daseinsanalytisches Inst für Psychotherapie und Psychosomatik, Zürich, Switzerland) **[The existentialist view of psychotherapy.]** (Germ) *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 337-349.—Describes the role of the existential analytical view or phenomenological approach in the psychotherapist's search for the human cause of health and sickness in cases of neurotic, psychotic, and psychosomatic illnesses. The existential analytical approach is defined as a method which emphasizes insight into each individual patient's state of mind, in contrast with methods of the natural sciences which attempt to quantify the mind. The historical development of existential analysis is traced from Freud's psychoanalysis through M. Heidegger's philosophical existential analysis. The present trend among doctors and psychologists to abandon the dualistic view of body and soul in diagnosing and treating illness, and to rely on philosophically based confluence of both concepts, is noted. (English abstract)—*R. Tomasko*.

12075. Cremerius, Johannes. (U Freiburg, W Germany) **[The relationship between psychotherapeutic technique and theory of psychotherapy.]** (Germ) *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 238-248.—Discusses the necessity for having a theoretical basis for psychotherapeutic technique. The reasons for needing a systematic method include limiting spontaneity to give the therapist guidelines in order to avoid trial and error work and to free the therapist to devise the best therapeutic plan for the patient. Other reasons are the need to reduce the subjective autonomy and "godlike" role of the therapist, and the necessity to have a preformed theory in order to have scientific discussions in forums with other therapists. The role of the therapist in this process is described as working together with the patient leading to a new identity, and the aim of psychotherapy is said to be helping the patient to see the conflict between anxiety and freedom and to come to his/her own decision. (English abstract)—*R. Tomasko*.

12076. Deykin, Eva; Weissman, Myrna; Tanner, Jan & Prusoff, Brigitte. (Boston State Hosp, MA) **Participation in therapy: A study of attendance patterns in depressed outpatients.** *Journal of Nervous & Mental Disease*, 1975(Jan), Vol 160(1), 42-48.—Studied the attendance patterns of 36 25-60 yr old predominantly lower-class, depressed women receiving outpatient psychotherapy to determine the actual amount and frequency of therapy received in an 8-mo period. At the initiation of therapy, the majority of patients expressed either neutral or negative attitudes to therapy. Contrary to the usually held belief that indifferent attitudes to therapy coupled with the patients' low socioeconomic status augured poorly for the patients' continuation in therapy, the sample attended regularly and remained in therapy until the end of the prescribed 8-mo period. Missed appointments occurred rarely and were usually preceded by cancellations. The majority of therapy sessions were with patients, but provisions were available for the involve-

ment of spouses and other relatives where indicated. It is suggested that the time-limited nature of therapy, the delineation of short-term, realistically attainable goals, and the vigorous outreach techniques by the therapists may have contributed to the unexpectedly high therapy attendance.—*Journal abstract.*

12077. Fink, Max. (State U New York, Health Sciences Ctr, Stony Brook) **Brain function, verbal behavior, and psychotherapy.** *Comprehensive Psychiatry*, 1974(Jul-Aug), Vol 15(4), 257-266.—Develops a theoretical construct for combined psycho- and somatic therapies. A specific somatic therapy is selected because of defined neurophysiologic effects, which are monitored to explain individual differences in metabolism. Attitudinal, linguistic, and perceptual tests are used as predictors of adaptive response, and outcome is defined by changes in adaptation in the dyadic relationship. This model integrates the individual psychologic characteristics of the S with the induced neurophysiologic effects of available somatic therapies. (30 ref)—*R. Tomasko.*

12078. Fordham, Michael. **Defences of the self.** *Journal of Analytical Psychology*, 1974(Jul), Vol 19(2), 192-199.—Discusses ego defenses, transference, and countertransference psychoses. The analyst should not make confessions or give information about himself; nor should he become excessively passive or feel guilty because of the pain and terror that the patient claims the analyst causes.

12079. Fox, J. Robin. (London School of Economics & Political Science, England) **Witchcraft and clanship in Cochiti therapy.** In A. Kiev (Ed), *Magic, faith, and healing: Studies in primitive psychiatry today*. New York, NY: Free Press, 1974. xvii, 475 p. \$2.95.

12080. Frank, Jerome D. (Johns Hopkins Hosp, Phipps Clinic, Baltimore, MD) **Common features of psychotherapies and their patients.** *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 368-371.—Defines demoralization as the single condition common to all complaints for which patients seek psychotherapeutic help. Demoralization is the state of mind of a person feeling unable to cope with a particular life situation and is characterized by loss of self-confidence, failure feelings, guilt, shame, and isolation from potential sources of help. Specific symptoms are understood as direct expressions of the demoralized state of mind (e.g., depression) or as symbolic ways of attempting to express, evade, or cope with inner conflicts or stressful relations. Symptoms both reduce a person's coping capacity and vary with the degree of demoralization. Causes of demoralization are classified as psychological, structural (genetic), and environmental. 4 components of all forms of therapy are described: a therapeutic relationship, a therapeutic setting, a conceptual scheme, and a procedure or ritual based on the conceptualization. The function of all schools of therapy is considered to be restoration of the patient's morale.—*R. Tomasko.*

12081. Fusswerk-Fursay, J. **The method in psychotherapy.** *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 439-443.—Discusses the importance of linking the concepts of psychotherapy and beliefs in any theoretical study of the psychological basis of psychotherapy.

12082. Garfield, Sol L. (Washington U) **What are the therapeutic variables in psychotherapy?** *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 452-474. Reviews the recent literature describing the possible variables which are therapeutic in psychotherapy. Topics include patient's perceptions and expectations, characteristics of the therapist, desensitization, insight-oriented therapy and its cultural bounds, patient confidence in the therapist, and degree of disturbance in the client. Nonspecific factors and the placebo response are discussed, and the lack of consensus and continued research on the essential variables producing change is noted. (30 ref)—*R. Tomasko.*

12083. Gomes de Aranha, H. A. (Univ. de Sta. Catarina, Porto, Portugal) **What is psychotherapy?** *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 449-454.—Discusses the nature of psychotherapy with special reference to the work of K. Jaspers. An outline of principles, around which the therapeutic relationship develops, are presented. The importance of the ethical standards in which the relationship exists is stressed and the therapist is cautioned not to impose his personal values to impose on more reality-based ones of the patient. The therapist is expected to be willing to temporarily engage himself in the existential part of the patient, without becoming involved in the emotional texture of the conflict. The therapist is warned not to let psychotherapy become ingenuously dangerous by attempting to solve all the problems of society.—*R. Tomasko.*

12084. Hagelin, Agents & Lacer, Paul. **The Flomp Method: A method for therapy and development based on controlled daydreams.** *International Journal of the Research Newsletter*, 1974(Winter), Vol 1(4), 1-5. Describes the Flomp Method (FM) and its theoretical and utility, based on personal experience with the method in practice. Essentially an exercise method, FM consists of relaxation training, and then uses visualization techniques to help create an inner world, which then contains the positive forces within the client. The client uses this inner world to grasp feelings, emotions, and problems, and practice interpretations, resolutions, and daydreams, generated by these feelings and emotions. consist of a large number of controlled inner images, "controlling schemes" and controlling "personae" or "masks." If used intensively to reach a certain level, other therapies, FM functions effectively with a wide variety of clients.—*R. Tomasko.*

12085. Harbin, Henry C. (Marshall Medical Center, Baltimore) **Some advantages and disadvantages of conducting individual and conjoint family therapy by the same therapist.** *Journal of the American Academy of Psychotherapy*, 1974(Jan), Vol 20(1), 20-22. Presents some theoretical and practical issues concerning conjoint family therapy in transference in patients and family members, when, and therapy techniques which are involved when conducting individual and family therapy by the same therapist. Here these issues center and focus on the processes involved in this approach to therapy are discussed, using case examples as illustrations. It is suggested that the experience of family therapy is advantageous to the therapist in understanding the patient's conflicts.—*F. L. Ayer.*

12086. **Harfinger, Hanspeter.** (Oldenburgisches Landeskrankenhaus Wehnen, W Germany) [Communication between the psychiatrist and the patient.] (Germ) *Praxis der Psychotherapie*, 1973(Aug), Vol 18(4), 166-172.

12087. **Harris, Gloria G. & Wagner, Nathaniel N.** (Inst for Family Research & Training, San Diego, CA) *Treatment of sexual dysfunction and casework techniques.* *Clinical Social Work Journal*, 1973, Vol 1(Special Issue), 244-250.—Describes the sexual counseling program at the University of Washington Psychology Clinic. A modified version of W. H. Masters and V. E. Johnson's approach is used. Couples remain in their own homes and are seen 2 or 3 times a week for 3-10 wks. Case illustrations help to clarify some of the sexual problems encountered and the basic treatment methods.

12088. **Howells, J. G. & Cooke, D. K.** *The practice of occupational therapy in child psychiatry.* *Child Psychiatry Quarterly*, 1972(Oct), Vol 5(4), 9-12.

12089. **Hubback, Judith.** (Private practice, London, England) *Notes on manipulation, activity and handling.* *Journal of Analytical Psychology*, 1974(Jul), Vol 19(2), 182-191.—Handling is defined as the activity of the analyst, manipulation as the activity of the patient. When these activities occur in excess they hamper progress in the analytic sessions. They are analyzed as interactions in the transference and countertransference process. The patient makes use of the analyst's personality, handling, and style. (18 ref)—*P. Federman.*

12090. **Jörstad, Jarl.** (Dikemark Hosp, Oslo, Norway) *Psychotherapy in a psychiatric institution: Attitude and process.* *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 281-292.—Discusses the importance of the therapeutic attitudes of mental health center workers based on experiences with individual psychotherapy and milieu work in a mental hospital. The limitations of individual psychotherapy in an institutional setting—due to patient's ego weakness, the lack of experienced therapists, and the need to integrate it with other treatment modes—are considered, and the importance of the therapist acting as a model and a supervisor is emphasized. The reorganization of an institution's treatment milieu around a group-oriented system is presented, and the shift toward increased outpatient activity and work with the patient's families and social situation is discussed. Political aspects of extending psychiatric treatment in Norwegian society are considered along with the conflict between bureaucratic and therapeutic cultures. (29 ref)—*R. Tomasko.*

12091. **Kaplan, Bert & Johnson, Dale.** (Rice U) *The social meaning of Navaho psychopathology and psychotherapy.* In A. Kiev (Ed), *Magic, faith, and healing: Studies in primitive psychiatry today.* New York, NY: Free Press, 1974, xvii, 475 p. \$2.95.

12092. **Kessler, Morris M.** *Views on the dynamics of depression and mania following long psychotherapy of a case: The importance of denial.* *Dynamische Psychiatrie*, 1974, Vol 7(1), 32-57. Reports in detail the case history of a 33-yr-old woman suffering from alternating periods of depression and mania, treated by psychoanalysis for a period of 8 yrs. The psychogenesis and psychodynamics of depression and mania as shown by the case are discussed and analyzed in light of the theories of K. Abraham, Freud, B. Lewin, and others. The case is

interpreted as a defensive struggle of the ego to avoid the pain of an original traumatic situation between the patient and the mother figure, an ego using the active defense mechanisms of denial and repression rather than seeking a cure. Denial is the predecessor of repression and, if through denial the manic patient can avoid repetition of the traumatic experience, the ego may succeed in repressing the entire conflict. The severe pathological manifestations cease and the patient is "normally" neurotic only. Since the original internalized problem has not been removed, however, the patient remains extremely vulnerable to new attacks whenever the original problem is recathetized by a new trauma. (German summary)—*T. Fisher.*

12093. **Kielholz, P.** (Psychiatrische klinika university, Basel, Switzerland) [Present state of antidepressive therapy.] (Czech) *Československá Psychiatrie*, 1973(Jun), Vol 69(3), 145-152.—Discusses the symptomatology, diagnosis, and therapy of depressive states. In the last 20 yrs the number of depressed patients has increased, accompanied by a change of symptomatology. The first problem to be solved in any case of depression is the danger of eventual suicidal action. Exact differential diagnosis is essential to successful treatment; the choice of antidepressive drugs should depend on symptoms such as psychomotor retardation, depressed mood, and anxiety. The principal diagnostic characteristics of different depressive states are mentioned and the therapeutic actions of different antidepressive drugs are described. (Russian & English summaries)—*V. Fischmann.*

12094. **Kiev, Ari.** (Columbia U, Coll of Physicians & Surgeons) *Implications for the future.* In A. Kiev (Ed), *Magic, faith, and healing: Studies in primitive psychiatry today.* New York, NY: Free Press, 1974, xvii, 475 p. \$2.95.

12095. **Kirsch, Thomas B.** (C. G. Jung Inst of San Francisco, CA) *A clinical example of puer aeternus identification.* *Journal of Analytical Psychology*, 1974(Jul), Vol 19(2), 151-164.—Presents the clinical aspects of a patient identified with the *puer aeternus* archetype and points out many similarities to other cases. Interpretations and confrontations are effective with this type of patient. If interpretations are too early, however, the patient will abandon therapy; but if the therapist proceeds slowly the patient will gradually approach reality.—*P. Federman.*

12096. **Klein, Michael.** [Who really needs psychoanalysis? Notes on the International Congress for Group Psychotherapy at Zürich.] (Germ) *Kolner Zeitschrift für Soziologie und Sozialpsychologie*, 1974(Jun), Vol 26(2), 439-449.

12097. **Kohler, Christa & Seidel, Karl.** (Karl-Marx U, Leipzig, E Germany) [Relationship between image of man and psychotherapy.] (Germ) *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 203-211.—Discusses the lack of a specific medical concept of the essence of man as a whole, and explains the Marxist concept of "image of man" as resting on total interrelationships of man and society and nature. The Marxist concept is contrasted with E. Fromm's stress on minimizing instinctual drives and using depth psychological procedures on a large scale to cure mentally sick society. The

client-centered premises of the therapy of Rogers, Tausch, and Truax are reviewed as ignoring social and economic structures while still using Marxist values of consciousness and self-realization. Therapeutic benefit from increased adoption of the Marxist image of man in psychotherapy is predicted. (English abstract)—*R. Tomasko*.

12098. Kratochvíl, S. (Psychiatrická léčebna, Kroměříž, Czechoslovakia) [Psychotherapy in socialist countries.] (Czec) *Československá Psychiatrie*, 1973(Jun), Vol 69(3), 180-189.—Surveys the state of psychotherapy in 8 European socialist countries. Despite a considerable variety of approaches, 2 prevalent trends are found: (a) the use of hypnosis and autogeneous training, and (b) the development of dynamically oriented group therapy that uses principles of therapeutic community. (Russian & English summaries) (41 ref)—*V. Fischmann*.

12099. La Barre, Weston. (Duke U) **Confession as cathartic therapy in American Indian tribes.** In A. Kiev (Ed), *Magic, faith, and healing: Studies in primitive psychiatry today*. New York, NY: Free Press, 1974. xvii, 475 p. \$2.95.

12100. Lambo, T. Adeoye. (University Coll Ibadan, Nigeria) **Patterns of psychiatric care in developing African countries.** In A. Kiev (Ed), *Magic, faith, and healing: Studies in primitive psychiatry today*. New York, NY: Free Press, 1974. xvii, 475 p. \$2.95.

12101. Lambo, T. Adeoye. (World Health Organization, Geneva, Switzerland) **Psychotherapy in Africa.** *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 311-326.—Describes aspects of African culture important to understanding the practice of psychotherapy there. Determinants of health and disease are conceptualized holistically, and "reality" is defined as an acceptance of a life of acquiescence with beings and essences on a spiritual scale rather than as an attempt to master objects. Patient management involves a diagnosis directed at the immediate cause of the illness, the remote cause, and the determination of the form of therapy to be followed. The therapy is designed to involve the practitioner, the patient, his/her family and the community-at-large. An example of a village-based treatment of schizophrenic patients is presented. The importance of using multidimensional models of man's nature and therapy, and of making greater use of the empirically-derived experiences of African psychotherapy, are stressed. (24 ref)—*R. Tomasko*.

12102. Lester, David. (Richard Stockton State Coll) **Telephone counseling and the masturbator: A dilemma.** *Clinical Social Work Journal*, 1973, Vol 1(Special Issue), 257-260.—Describes difficulties experienced by female telephone counselors when the caller is masturbating. The psychodynamics of this type of caller are briefly pointed out and suggestions are made as to how to handle such calls. Telephone counseling is not considered an effective way of treating this type of problem.

12103. Madsen, William. (Purdue U) **Value conflicts and folk psychotherapy in south Texas.** In A. Kiev (Ed), *Magic, faith, and healing: Studies in primitive psychiatry today*. New York, NY: Free Press, 1974. xvii, 475 p. \$2.95.

12104. Marks, Isaac M. (U London, Inst of Psychiatry, England) **Empirical psychotherapeutic methods.**

*Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 222-237.—Examines recent advances in the application of psychotherapeutic techniques. 4 aims of psychotherapeutic procedures are identified: experiential, nurturing self-knowledge, confessional catharsis, and production of lasting behavior changes. Controlled empirical studies dealing with phobic disorders, obsessive-compulsive neurosis, anxiety states, social anxieties, abnormal personalities, marital and family pathology are reviewed; and effects resulting from 6 procedures (exposure treatments, operant shaping and biofeedback, meditation, self-regulation, modeling, and interpretive methods) are considered. The development of a global theory of psychotherapy is viewed as currently counterproductive. The importance of the empirical practice of psychotherapy is stressed. (2 p ref)—*R. Tomasko*.

12105. Morris, G. Barry. (U Alberta, Edmonton, Canada) **Personality change through bibliotherapy.** *Western Psychologist*, 1973, Vol 4(3), 61-71.—Discusses a theoretical model to explain bibliotherapy. The importance of both the cognitive and affective content of literature used in bibliotherapy is stressed. 19 books with affective content and 26 books with cognitive content are listed. A phenomenological model of personality is proposed, stressing the importance of affective and cognitive domains in personality growth. Hence, the client must both experience and understand the themes he reads about. He then becomes aware of the predominant theme in literature: man is active rather than reactive. He thus develops maximum utilization of his own activation energy. (32 ref)—*D. R. Evans*.

12106. Murphy, Jane M. (Cornell U, Medical Coll, New York) **Psychotherapeutic aspects of shamanism on St. Lawrence Island, Alaska.** In A. Kiev (Ed), *Magic, faith, and healing: Studies in primitive psychiatry today*. New York, NY: Free Press, 1974. xvii, 475 p. \$2.95.

12107. Öztürk, Orhan M. (U Ankara, Turkey) **Folk treatment of mental illness in Turkey.** In A. Kiev (Ed), *Magic, faith, and healing: Studies in primitive psychiatry today*. New York, NY: Free Press, 1974. xvii, 475 p. \$2.95.

12108. Plaut, A. (Middlesex Hosp, London, England) **Part-object relations and Jung's "luminosities": A comment on psycho-dynamic theories.** *Journal of Analytical Psychology*, 1974(Jul), Vol 19(2), 165-181.—Discusses the values of theories as a viewpoint and a frame of reference without which analysts can become lost and unable to function. Also considered are the compatibility of psychodynamic theories, the theory of object-relations and its bearing on analytical psychology, and the cultural and social setting in which psychodynamic theories function. (25 ref)—*P. Federman*.

12109. Prince, Raymond. (McGill U, Montreal, Quebec, Canada) **Indigenous Yoruba psychiatry.** In A. Kiev (Ed), *Magic, faith, and healing: Studies in primitive psychiatry today*. New York, NY: Free Press, 1974. xvii, 475 p. \$2.95.

12110. Prinz, Robert & Loney, Jan. (Louisa County Schools, IA) **Teacher-rated hyperactive elementary school girls: An exploratory developmental study.** *Child Psychiatry & Human Development*, 1974(Sum), Vol 4(4), 246-257.—Compared data on 8 1st 3rd grade and 8 4th-6th grade hyperactive girls with their classmates

controls. Behavior ratings were made by an art teacher trained in art therapy. No differences were found in either age group between hyperactive and control Ss on general adjustment, art creativity, or self-esteem, though self-esteem of older controls was higher than that of younger controls ( $p < .10$ ). For both age groups, hyperactive Ss were lower than controls in impulse control ( $p < .01$  and  $p < .001$ ). Comparison with findings on boys suggests that hyperactive girls may differ in important ways.—E. S. Goodman.

12111. Reiter, L. & Strotzka, H. (U Wien, Inst für Tiefenpsychologie und Psychotherapie, Austria) **Some problems concerning the goals in psychotherapy.** *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 423-427.—Discusses the forms of language used to describe goals in psychotherapy. The theories developed by various psychotherapeutic schools are viewed as contrasting descriptive sentences with sets of evaluative and prescriptive sentences. In this way, statements about reality are compared with statements having emotional content. 4 requirements for therapeutic activity are presented: (a) exact definition of goals, (b) elaboration of performance and judgment alternatives, (c) consideration of the range of knowledge of the consequences of actions and their side effects, and (d) modifying the present closed-system socialization of psychotherapists. (18 ref)—R. Tomasko.

12112. Roth, Marvin & Kuiken, Don. (U Alberta, Edmonton, Canada) **Communication immediacy, cognitive compatibility, and immediacy of self-disclosure.** *Journal of Counseling Psychology*, 1975(Mar), Vol 22(2), 102-107.—Assessed the immediacy of self-disclosures of 24 conceptually complex and 24 conceptually simple introductory psychology students as a function of (a) the level of immediacy of a confederate's self-disclosures and (b) the similarity of the S's and confederate's levels of conceptual complexity. Equal numbers of male and female Ss were used. Ss were slightly more immediate when the confederate was immediate and conceptually complex than when he was nonimmediate and conceptually simple. However, when the confederate was conceptually simple, the effects of confederate immediacy were reversed, contrary to expectations based on social exchange theory but consistent with an interpretation based on the double-bind theory of communication. Female Ss were more immediate in similar than in dissimilar dyads, although this pattern did not occur for male Ss. (18 ref)—*Journal abstract*.

12113. Sacks, James. **The psychodramatic approach.** In D. S. Milman & G. D. Goldman (Eds), *Group process today: Evaluation and perspective*. Springfield, IL: Charles C Thomas, 1974. xxii, 313 p.

12114. Schmidt, K. E. (Sarawak Mental Hosp, Kuching) **Folk psychiatry in Sarawak: A tentative system of psychiatry of the Iban.** In A. Kiev (Ed), *Magic, faith, and healing: Studies in primitive psychiatry today*. New York, NY: Free Press, 1974. xvii, 475 p. \$2.95.

12115. Seguin, Carlos A. (Inst Peruano de Estudios Psiquiátrico-Sociales, Lima) **What folklore psychotherapy can teach us.** *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 293-302.—Folklore psychiatry is defined as the study of ideas, beliefs, and practices concerning

psychiatric conditions and their treatment as maintained by popular tradition in Western cultures. It is differentiated from ethno- and quack-psychotherapy. Studies from the Peruvian Institute for Socio-Psychiatric Studies are cited to outline factors important to the success of folklore therapy, including the use of aversion therapy, utilization of native plants and drugs, alternate forms of patient-group-healer relationships, and hypnosis. An example of the treatment of chronic alcoholism by native healers is presented and the urgency of incorporating knowledge of folklore psychiatry into the medical curriculum and psychiatric residencies is stressed. (21 ref)—R. Tomasko.

12116. Sidley, Nathan. (Fourth District Court of Eastern Middlesex, Woburn, MA) **On theories and rules of procedure in psychotherapy.** *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 384-388.—Presents a postulate system definition of mind based on concepts of the individual and his/her environment, action possibilities, emotional and informational systems. Psychopathology is viewed as a function of the mind leading to action less effective than some optimal action in a given situation. A set of rules for psychotherapy is presented: (a) The therapist is responsible for what happens in therapy. (b) There are no specific rules for patient behavior. (c) A therapist must think about the patient in the context of concepts of mind. (d) The therapist should provide the patient with tools to handle his/her own problems, rather than directly dealing with the problems. Several practical considerations regarding the conduct of therapy are also suggested.—R. Tomasko.

12117. Simon, Rita M. **Pictorial style as a means of communication.** *American Journal of Art Therapy*, 1974(Jul), Vol 13(4), 275-292.—Discusses a theory that the patient's artistic style ought to be considered separate from the specific content of the art when produced. The theory holds that there are 4 basic styles: traditional massive, traditional linear, archaic linear, and archaic massive. The archaic and traditional massive styles are considered in detail. A case study is presented to demonstrate a patient's ability to achieve mental stability of spontaneous art experiences in which therapeutic intervention was minimal. By understanding the patient's visual styles, the art therapist was able to follow his progress.—H. J. McWhinnie.

12118. Stone, Michael H. **Mesmer and his followers: The beginnings of sympathetic treatment of childhood emotional disorders.** *History of Childhood Quarterly: The Journal of Psychohistory*, 1974(Spr), Vol 1(4), 659-679.—Discusses the beginnings of the empathic and humanistic tradition in child psychotherapy in the 18th century with innovators such as F. A. Mesmer and J. M. G. Itard, and relates these beginnings to the foundations of sympathetic treatments of childhood emotional disorders in the 19th century. The return to nature in the tradition of Rousseau is cited as an important early event in the humane approach. 6 passages from the works of early Mesmerists are presented and discussed in terms of love and empathy with their patients. (19 ref)—J. Carlson.

12119. Strupp, Hans H. (Vanderbilt U) **"Spontaneous remission" and the nature of the therapeutic influence.** *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 389-393.—Examines the possibility that anyone claiming

treatment success with any given form of psychotherapy might be capitalizing on naturally occurring events—the problem of “spontaneous remission.” The nature of therapeutic influence is reviewed in the works of H. J. Eysenck, L. Subotnik, A. E. Bergin, T. S. Szasz, and J. D. Frank. Estimations of the spontaneous recovery rate and the degree of usage of nonpsychiatric treatment resources are discussed. A research effort comparing groups treated by professional therapists with groups treated by nonprofessional change agents is described as a way of determining the professional therapist's unique contribution to therapeutic change.—*R. Tomasko.*

12120. **Strupp, Hans H.** (Vanderbilt U) **On the basic ingredients of psychotherapy.** *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 249-260.—Presents essential conditions for psychotherapeutic change that are equally applicable to psychoanalytic and behavior therapies. 3 conditions are discussed: the creation of a helping relationship patterned after the parent-child relationship; the creation of a power base from which the therapist influences the client through common psychological techniques; and a client with the capacity to profit from the experience. To profit from therapy a client is assumed to have a degree of intelligence, an ability to view his/her feelings and behavior objectively, a willingness to undergo/relive painful experiences, as well as the time, money, and patience. Therapy is contrasted with childrearing, and the problem of how external controls are transformed into internal ones is viewed as one of psychotherapy's basic issues. (21 ref) —*R. Tomasko.*

12121. **Szasz, Thomas S.** (State U New York, Upstate Medical Ctr, Syracuse) **The myth of psychotherapy.** *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 212-221.—Discusses the metaphorical nature of psychotherapeutic interventions and examines linguistically the nature of mental illness. Several medical definitions of psychotherapy are reviewed and psychotherapeutic interventions are contrasted with other forms of medical treatments. The conflict between Freud and Jung is viewed in terms of the creation of psychoanalysis as a pseudoscience. The need to unmask psychotherapy's false medical conceptualizations and to cast them in a nonmedical, nondiagnostic, and nontherapeutic framework and vocabulary is stressed. Psychotherapy is concluded to be a form of secular ethics with its language that of medical jargon, its theology positivism, and its ultimate value Science.—*R. Tomasko.*

12122. **Tavormina, Joseph B.** (U Virginia) **Relative effectiveness of behavioral and reflective group counseling with parents of mentally retarded children.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 22-31.—Evaluated the relative effectiveness of behavioral and reflective group parent counseling. Ss were 51 mothers of mentally retarded children who were assigned to behavioral, reflective, or waiting-list control groups. 6 success criteria, including direct observations, attitudinal scales, maternal reports, and frequency counts, were used to measure outcome (e.g., Hereford Parent Attitude Survey and the Missouri Behavior Problem Checklist). Both types of counseling had a beneficial effect relative to the untreated controls, but the behavioral method resulted in a significantly greater

magnitude of improvement. The consistency of these results across measures strongly suggests that the behavioral technique was the treatment of choice for counseling parents of the retarded. (29 ref)—*Journal abstract.*

12123. **Tec, Leon.** (Mid-Fairfield Child Guidance Ctr, Norwalk, CT) **Flexibility within structure: A concept in psychotherapy.** *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 394-398.—Uses case examples to illustrate the need for a therapist to be skilled in more than 1 treatment method, and to be more attuned to the patient's individual needs than the requirements of a stereotyped technique.

12124. **Uchtenhagen, A.** (U Zürich, Switzerland) **[Problems of rehabilitating patients with chronic schizophrenic psychoses.]** (Germ) *Schweizer Archiv für Neurologie, Neurochirurgie und Psychiatrie*, 1973, Vol 112(1), 95-102.—Discusses problems of rehabilitating patients with chronic schizophrenic psychosis in general and the rehabilitation program of the Burghölzli psychiatric clinic service in particular.

12125. **Vander Well, Allen R. & Williams, Clive.** (U Alberta, Edmonton, Canada) **The psychotherapy relationship: Toward a behavioural definition.** *Australian Psychologist*, 1974(Mar), Vol 9(1), 50-59.—Views the therapeutic relationship as a construct derived from behaviors which mutually affect 2 or more persons. Theoretical distinctions and research considerations are presented. (37 ref)

12126. **von Vexküll, Thure.** **[Information as communication and model.]** (Germ) *Praxis der Psychotherapie*, 1973(Aug), Vol 18(4), 137-150.—Discusses information theory as applied to the physician-patient relationship.

12127. **Walker, Preston A. & Halzlip, Thomas M.** (Dorothea Dix Hosp, Raleigh, NC) **Alternatives to chronic undifferentiated treatment.** *Diseases of the Nervous System*, 1974(Dec), Vol 35(12), 551-555.—Explores techniques of child psychiatry incorporating both the traditional and the newer innovative techniques of psychotherapy. The Group for the Advancement of Psychiatry's classification for psychopathological disorders in childhood is discussed, illustrated with actual clinical cases. For the healthy response a therapeutic model is recommended characterized by counseling and guidance with the family in a supportive manner and with appropriate follow-up. In the treatment of developmental variations, a dual approach is recommended involving short-term insight-oriented psychotherapy with re-educative goals for the child and goal-directed casework for parents. For psychoneurotic disorders, an approach of child analysis or insight-oriented psychotherapy with informative alliance for the parents is suggested. A broad spectrum of approaches for personality disorders is recommended; the well-organized personality, the neurotic personality, and the impulse-ridden personality are discussed. Psychotic disorders require a total treatment situation including intrapsychic, interpersonal, and environmental approaches. Psychophysiological disorders, brain syndromes, and mental retardation are also detailed.—*R. S. Albin.*

12128. **Wang, Christine W.** (George Washington U, Medical Ctr) **Expressive drawings by a patient in two**

**unwed pregnancies.** *American Journal of Art Therapy*, 1974(Jul), Vol 13(4), 303-315.—Compared the art work of an unwed mother during 2 pregnancies 3 yrs apart, and analyzed her feelings as thus expressed. Similarities of circumstance and mental attitudes are noted.

12129. Witt, Jody. (Royal Ottawa Hosp, Ontario, Canada) **The team concept as interpersonal ping pong.** *Journal of Leisureability*, 1974(Apr), Vol 1(2), 14-20.—Uses the metaphor of a ping-pong game to examine patterns of interaction in the team approach to recreational and other types of therapy. A scenario of a staff meeting is presented in which the client is the "ball" who is "volleyed" by team members. Points are lost for hindering other team members or failing to provide good service. It is concluded that team members must either prevent the game from occurring or learn to stop it once it starts. Specific ameliorative and preventive techniques are listed, including emphasis on positive feedback and collaboration.—C. Wright.

12130. Wittkower, E. D. & Warnes, H. (McGill U, Montreal, Quebec, Canada) **Cultural aspects of psychotherapy.** *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 303-310.—Examines the cultural basis of several types of therapies. The emphasis on individualism, rational thinking, scientific idolatry, and toleration of dissent have facilitated the adoption of psychoanalysis in the US, while more authoritarian societies have tended to reject it. The use of work therapy and pathogenic psychotherapy in the Soviet Union and autogenic training in Germany are reviewed. The mysticism in Jung's analytic psychology is assumed to appeal to the Germans' mystical cultural leanings. Divergent views on the application of Western psychotherapeutic procedures to non-Western societies are discussed, and the difficulties arising when the mother tongue and basic world view of the therapist and client differ are noted. The services of traditional healers in developing countries are concluded to be indispensable for some time. 5 interim steps are suggested for the practice of therapy in a population undergoing Westernization. (18 ref)—R. Tomasko.

#### Drug Therapy & Drug Rehabilitation

12131. Aron, William S.; Alger, Norman & Gonzalez, Ricardo T. (Albert Einstein Coll of Medicine, Ctr for the Study of Social Intervention, Yeshiva U) **Chicanoizing the therapeutic community.** *Journal of Psychedelic Drugs*, 1974(Jul-Sep), Vol 6(3), 321-327.—Describes a drug-free therapeutic community oriented to the cultural values of a Chicano population. The need for separate treatment programs for Chicanos is stressed, and the characteristics of Mexican-American drug addiction in La Colonia, California, are discussed. 13 specific Chicano-oriented treatment concepts are presented and a 4-phase program is outlined. The importance of the integration of the program's graduates into the social structure of the larger Chicano community is highlighted as a method to discourage the use of drugs by youth.—R. Tomasko.

12132. Astrup, C. et al. (Tromsø U, Norway) **A study of flupenthixol decanoate and pipotiazine undecylenate in schizophrenics.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(5), 481-491.—Treated 43 female schizophrenic inpatients with flupenthixol decanoate or pipotiazine

undecylenate for 8 mo. The Ss were evaluated in a double-blind study for 2 mo. The calculated daily dosage of both drugs was 6 mg. The trial started with 4-wk intervals between the injections, which had to be decreased to 2 wks for most patients during the open trial. No significant therapeutic differences could be established between the 2 drugs in the double-blind trial. All the laboratory data were normal, and the local tolerance was excellent. 18 Ss were improved, 14 unchanged, and 11 worse after 8 mo of treatment. The improvement was predominantly due to less inhibitory and paralyzing side effects than with previous sedative oral neuroleptic medication. It is also noted that 12 Ss, unwilling or unreliable in taking oral drugs, could be discharged as improved on stable medication.—*Journal abstract*.

12133. Benkert, O.; Gordon, A. & Martschke, D. (U München, Psychiatrische Klinik, W Germany) **The comparison of thyrotropin releasing hormone, luteinizing hormone-releasing hormone and placebo in depressive patients using a double-blind cross-over technique.** *Psychopharmacologia*, 1974, Vol 40(2), 191-198.—9 unipolar and 3 bipolar, endogenously depressed female patients were treated in randomized order with a single injection of 600 µg thyrotropin releasing hormone, 500 µg luteinizing hormone-releasing hormone, and placebo. Ss were rated for changes in depression scores over a 6-day period. No significant differences could be seen between the treatments, although transient elevations in mood were subjectively observed. Results are discussed in relation to other reports on the therapeutic benefit of peptide hormones in psychiatry. (22 ref)—*Journal abstract*.

12134. Black, Dora & Woollacott, Susan. (Hosp for Sick Children, London, England) **Acute toxic psychosis in two children treated with benzhexol hydrochloride (Artane).** *British Journal of Psychiatry*, 1974(Nov), Vol 125, 483-484.—Reports 2 cases of toxic psychosis in children (ages 13 and 3½ yrs) given benzhexol hydrochloride in therapeutic doses. In both cases, complete recovery occurred rapidly when benzhexol was discontinued.

12135. Chinchund, Stephen J. (New York State Dept of Correctional Facilities, Taconic Correctional Facility, Bedford Hills) **A way to measure success in the rehabilitation of drug addicts.** *Social Work*, 1974(Nov), Vol 19(6), 737-740.—Proposes 4 questions for the drug addict to ask himself: "Do I want to live or die?" "Do I need help?" "Do I want help?" "Am I willing to make any sacrifices or take any risks to get the help I want?" The progressive attainment of positive answers to these questions is seen as one way to measure success in a rehabilitation program.

12136. Cohen, Wendy J. & Cohen, Norman H. (New York Medical Coll—Metropolitan Hosp Ctr, NY) **Lithium carbonate, haloperidol, and irreversible brain damage.** *JAMA: Journal of the American Medical Association*, 1974(Dec), Vol 230(9), 1283-1287.—4 acutely agitated patients with diagnoses of mania who were treated with a combined regimen of lithium carbonate and high doses of haloperidol developed severe encephalopathic syndromes. Symptoms consisted of lethargy, fever, tremulousness, confusion, and extrapyramidal and

cerebellar dysfunction, accompanied by leukocytosis and elevated levels of serum enzymes, blood urea nitrogen, and fasting blood glucose. 2 patients suffered widespread, devastating, irreversible brain damage, while 2 others were left with persistent dyskinesias. (30 ref)

12137. Coleman, James H. (U Tennessee, Coll of Pharmacy) **Concepts in beta blockade.** *Diseases of the Nervous System*, 1975(Jan), Vol 36(1), 46-47.—Briefly reviews recent reports on the usefulness of propranolol, emphasizing the drug's beta blocking activity. Some contraindications and precautions concerning propranolol use are included.

12138. Dasberg, H. & Van Praag, H. M. (U Groningen, Netherlands) **The therapeutic effect of short-term oral diazepam treatment on acute clinical anxiety in a crisis centre.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(3), 326-340.—Hypothesized that oral diazepam treatment (20 mg daily) during 5 days in combination with active inpatient crisis intervention would have a favorable effect on acute clinical anxiety states. A double-blind, random, placebo-diazepam design was used with 30 crisis inpatients. Clinical improvement was defined as a difference score in ratings based on psychiatric interviews and ward observation. Evidence derived from anxiety, nurse's, and visual analog scales does not support the assumption that diazepam is therapeutically better than placebo if the 2 medication groups were compared as units. For patients with the highest levels of pretreatment anxiety, short-term administration of oral diazepam was a valuable adjunct to the crisis-intervention program. Moreover, diazepam had a selective action for the improvement of insomnia, respiratory, and gastro-intestinal complaints. Diazepam or some factor connected with it had an adverse influence on some autonomous complaints. The need for study of the relationship between clinical effect and pharmacokinetic values, especially plasma concentrations of the drug and its active metabolite, is suggested. (32 ref)—*Journal abstract*.

12139. DiMascolo, Alberto; Klerman, Gerald L. & Prusoff, Brigitte. (Boston State Hosp, MA) **Relative safety of amitriptyline in maintenance treatment of depression.** *Journal of Nervous & Mental Disease*, 1975(Jan), Vol 160(1), 34-41.—In the course of long-term treatment with amitriptyline of 212 depressed women, the patients' somatic complaints were assessed. These somatic complaints included most symptoms generally attributed as being adverse effects of amitriptyline and other tricyclics. The reputed adverse effects were very often reported by patients prior to the initiation of antidepressant medication. Except for reports of dryness of mouth, all somatic complaints were reduced in frequency and intensity during the course of clinical improvement. When patients relapsed, regardless of whether they were or were not on maintenance medication, these somatic complaints returned. Except for dryness of mouth, no relationship between somatic complaints and dosage of amitriptyline was found.—*Journal abstract*.

12140. Epling, W. F. & Bradshaw, Peter. (U Southampton, England) **An experimental analysis of the shaping, maintaining and elimination of drug abuse behaviour.** *British Journal of Medical Psychology*,

1974(Dec), Vol 47(4), 341-348.—Presents a behavioral approach to drug addiction. 3 major topics are discussed: (a) the acquisition or shaping of drug-taking behavior, (b) the maintaining of this behavior once established, and (c) the elimination of drug abuse behavior. The basic principles of operant conditioning are illustrated with relevant animal and human literature. Particular emphasis is placed on the effects of previous experience with drugs and the effects of schedules of reinforcement on self-administration of drugs in infrahuman Ss. (19 ref)—*Journal summary*.

12141. Feinberg, Irwin et al. (VA Hosp, San Francisco, CA) **Sleep amphetamine effects on MBDS and normal subjects.** *Archives of General Psychiatry*, 1974(Nov), Vol 31(5), 723-731.—Reports that EEG sleep patterns in 8 male 7-10 yr olds with minimal brain dysfunction syndrome (MBDS or hyperkinesis) before and during stimulant treatment differed little from those of age-matched controls. It is unlikely that the therapeutic mechanisms of amphetamines in MBDS are exerted on or reflected in physiological sleep patterns. Neither MBDS children nor 6 normal young adults showed withdrawal elevations of REM sleep after administration of amphetamines in constant dosage. Young adults showed REM rebounds only when the dosage was increased prior to withdrawal. In contrast to sedative-hypnotics, stimulant drugs did not reduce eye movement activity during REM sleep. This difference is emphasized for the specificity hypothesis—that different classes of psychoactive drugs differentially alter physiological sleep patterns—would be untenable if sedatives and stimulants produced the same effects on sleep. (31 ref)—*Journal abstract*.

12142. Gerlach, J.; Koppelhus, P.; Helweg, E. & Monrad, A. (St Hans Hosp, Roskilde, Denmark) **Clozapine and haloperidol in a single-blind cross-over trial: Therapeutic and biochemical aspects in the treatment of schizophrenia.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(4), 410-424.—20 male hospitalized schizophrenic patients participated in a study of the antipsychotic properties, tolerance, and side effects of clozapine and haloperidol. Both clozapine and haloperidol reduced the intensity of the core symptoms of schizophrenia. Clozapine, however, was significantly better than haloperidol for the treatment of somatic concern, anxiety, conceptual disorganization, tension, and mannerism—posturing. This difference manifested itself, in particular, in cases of severe schizophrenia. In addition to its antipsychotic effect, clozapine had a pronounced sedative and hypnotic effect, particularly during the initial stages. Both drugs were well tolerated. Clozapine induced autonomic side effects in the form of increased heart rate, orthostatic hypotension, and hypersalivation. Haloperidol caused extrapyramidal side effects. Determination of the homovanillic acid in the cerebrospinal fluid was carried out on 5 of the patients prior to and during treatment. Results suggest that haloperidol increases the turnover of brain dopamine to a greater degree than clozapine. (24 ref)—*Journal abstract*.

12143. Greenwood, Joseph J. (US Federal Reformatory for Women, NARA Program, Alderson, WV) **Drug treatment in an institution.** In *Selected papers delivered at The Ninth Annual West Virginia School on Alcohol and*

**Drug Abuse Studies, June 17-22, 1973.** Morgantown, WV: West Virginia University, 1973. 165 p.—Discusses drug-treatment programs and institutions as 2 separate problems. Drug addiction is considered from the point of view of the personality characteristics of the addict and of the qualities necessary for creating a successful therapeutic community for the addict's rehabilitation.

12144. Hansen, V.; Hagen, A. S.; Lehmann, E. H. & Astrup, C. **Simplified symptom registration in psychiatric trials: A statistical approach.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(5), 492-495.—Performed a multivariate analysis of double-blind data on 43 female inpatients treated with flupenthixol decanoate and pipotiazine undecylenate. Brief Psychiatric Rating Scale (BPRS) scores were used as independent variables and Clinical Global Impression (CGI) scores as dependent variables. It was found that changes in global clinical impression scores mainly were determined by the following 4 BPRS items: Conceptual Disorganization, Blunted Affect, Unusual Thought Content, and Hallucinatory Behavior.—*Journal abstract.*

12145. Hansen, V.; Ravn, J. & Rud, C. (H. Lundbeck & Co, Copenhagen, Denmark) **Long-term treatment of psychiatric patients with clopenthixol: Analysis of laboratory tests with a view to long-term therapy.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(3), 309-317.—Examined 57 female inpatients who had been treated for 3-9 yrs with clopenthixol alone, to determine the effects of long-term therapy with clopenthixol in terms of measurable laboratory parameters. 26 patients had psychiatric diseases only and 31 had concomitant somatic diseases. Several parametric and nonparametric statistical methods were used to study the relationships between the measured values, in particular variations within the normal range between the 2 patient groups. Age, dose, duration of treatment, and laboratory tests were the measured variables. There were no indications that long-term treatment with clopenthixol exerted a nephrotoxic, hepatotoxic, or hematotoxic effect. Changes did occur in certain parameters, predominantly within the range of normal, especially in thymol turbidity values and total leucocyte count.—*Journal abstract.*

12146. Haskell, David S.; DiMascio, Alberto & Prusoff, Brigitte. (Boston U, Medical School) **Rapidity of symptom reduction in depressions treated with amitriptyline.** *Journal of Nervous & Mental Disease*, 1975(Jan), Vol 160(1), 24-33.—Studied 172 25-60 yr old depressed women treated with amitriptyline with particular attention to the speed of response in different symptoms of depression and in psychotic as compared to neurotic depressives. Findings from clinical interviews for depression (derived from the Hamilton Rating Scale for Depression) and the Raskin Three Area Scale for Depression show rapid improvement in suicidal feelings, insomnia, and anorexia, but slower and more gradual improvement in impaired work and interests, retardation, and pessimism and hopelessness. Psychotic depressives did not show substantial improvement until the 3rd wk of treatment whereas neurotic depressives improved markedly within the 1st wk. It is suggested that the psychotic classification may be more useful as a predictor of speed of response than as a predictor of final treatment outcome. (16 ref)—*Journal abstract.*

12147. Jost, F. & Zmorski, T. (Psychiatrischen Klinik Beverin Cazis, Switzerland) **[Mesoridazine (TPS 23 Sandoz) in acute psychotic states.]** (Germ) *Schweizer Archiv für Neurologie, Neurochirurgie und Psychiatrie*, 1973, Vol 112(1), 131-142.—Conducted a double-blind comparative study to examine the therapeutic effects and general and local tolerance of the intramuscular type of mesoridazine (TPS 23) vs chlorpromazine. Ss were 30 patients divided into 2 equal randomized groups, with diagnoses of acute and exacerbated schizophrenia and mania. The drugs were administered intramuscularly and orally for 11 days. The dosage ranged from 100 to 550 mg/day (average 200-300 mg). Results indicate that (a) both drugs were equally effective as neuroleptic agents and dosages of 100-350 mg daily achieved a quick calming of Ss and antipsychotic results; (b) TPS 23 was effective in the treatment of acute and chronic-exacerbated psychoses with symptoms of aggressivity, agitation, tension, anxiety, and sleep disturbances; (c) the tolerance levels of the 2 drugs were about equal; and (d) an initial dose of 100-300 per day is indicated, with higher dosages given if and when needed. (English summary) (37 ref)—*T. Fisher.*

12148. Karis, Norman L. (Appalachian Regional Hosp, AR-CAP, Beckley, WV) **AR-CAP and its components.** In *Selected papers delivered at The Ninth Annual West Virginia School on Alcohol and Drug Abuse Studies, June 17-22, 1973.* Morgantown, WV: West Virginia University, 1973. 165 p.—Discusses the background, development, and implementation of the Appalachian Regional Comprehensive Alcoholism Program. The hospital which serves as a center for the program provides emergency and inpatient services, intermediate care, education and consultation, outpatient follow-up, and vocational rehabilitation, training, and research.

12149. Kiloh, L. G.; Neilson, Megan & Andrews, Gavin. (U New South Wales, Prince Henry Hosp, Little Bay, Australia) **Response of depressed patients to methylamphetamine.** *British Journal of Psychiatry*, 1974(Nov), Vol 125, 496-499.—191 patients, including 39 with endogenous depression and 56 with neurotic depression, were each given 15 mg of methylamphetamine intravenously. There was a strong tendency for all patients—including those with schizophrenia—to feel better, irrespective of diagnosis. No significant difference was found between the responses of patients with neurotic and those with endogenous depression. No significant relationship was established between prognosis on discharge from hospital and 6 mo later in any diagnostic group. Those patients who felt worse after methylamphetamine showed a high incidence of hysterical symptoms or hysterical personality traits. Among those reporting no change, there was a significant preponderance of those dependent on drugs or alcohol.—*Journal summary.*

12150. Kohrs, Eldean V. (Central Wyoming Counseling Ctr, Casper) **Behavioral approaches to problem drinkers in a rural community.** *Behavioral Engineering*, 1973(Sum), Vol 1(1), 1-10.—Describes a technique used to treat 20 court-referred chronic alcoholics by changing them into moderate drinkers. The concept of alcoholism as a disease is challenged. The program initially attempted to force the use of disulfiram but without

success. Later the individual was given a week's supply of the drug and a chart to note his own progress. Because the local bar is an important social gathering-place in rural areas, the goal was to allow the drinker to be able to return to the bar for recreation while controlling his drinking. After 1 mo the chemical was gradually eliminated and electrical aversion was substituted. Data on Ss' background and MMPI scores are given. Findings show that there was a high rate of success for the application of the method. Suggestions for future work and possible applications of the technique are offered. —A. Debons.

12151. Leonard, Charles L. (Appalachian Mental Health Ctr, Detoxification Unit, Elkins, WV) **Treatment of the alcoholic in a community hospital.** In *Selected papers delivered at The Ninth Annual West Virginia School on Alcohol and Drug Abuse Studies, June 17-22, 1973*. Morgantown, WV: West Virginia University, 1973. 165 p.

12152. Malcolm, M. T.; Madden, J. S. & Williams, A. E. (West Cheshire Hosp, Chester, England) **Disulfiram implantation critically evaluated.** *British Journal of Psychiatry*, 1974(Nov), Vol 125, 485-489.—Treated 62 alcoholic patients by disulfiram implantation. At follow-up only 3 patients described any reaction on drinking, and it is suggested that their symptoms were probably psychogenic. Blood disulfiram levels above .1 mg% were invariably found after oral disulfiram therapy. Such levels were occasionally recorded after implant, but only during the 1st postoperative week, when patients were usually still in the hospital. Carbon disulphide, a metabolite of disulfiram, was measurable in the exhaled breath of patients given oral disulfiram. Except in 1 case, this was not so after implantation. It is believed that implantation does not give the patient pharmacologically active disulfiram cover, and that the deterrent effect of the procedure is psychological. (18 ref)—*Journal summary*.

12153. Mason, Aaron S. (U Kentucky, Medical Ctr) **The psychotropic drug summary.** *Diseases of the Nervous System*, 1975(Jan), Vol 36(1), 44-45.—Discusses the importance of maintaining up-to-date psychotropic drug summaries in the medical records of mental patients. A brief sample of a drug summary is included.

12154. McBride, John. (Appalachian Regional Hosp, Beckley, WV) **Intermediate treatment services available for alcoholics at the Beckley Appalachian Regional Hospital.** In *Selected papers delivered at The Ninth Annual West Virginia School on Alcohol and Drug Abuse Studies, June 17-22, 1973*. Morgantown, WV: West Virginia University, 1973. 165 p.

12155. Mendez, Jorge S.; Cotzias, George C.; Mena, Ismael & Papavasiliou, Paul S. (Brookhaven National Lab, Medical Research Ctr, Upton, NY) **Diphenylhydantoin: Blocking of levodopa effects.** *Archives of Neurology*, 1975(Jan), Vol 32(1), 44-46.—Examined the effects of diphenylhydantoin (DPH) in adult inpatients: 5 parkinsonism and 2 chronic manganese poisoning Ss receiving optimal levodopa treatment and 2 Huntington chorea Ss receiving no other treatment. DPH diminished the therapeutic effects of levodopa both in parkinsonism and manganese poisoning Ss, as well as the levodopa-dependent dyskinesia for which the former were selected. In Ss

with chorea, DPH enhanced chorea and mental agitation and failed to conform with the postulated pharmacological reciprocity between parkinsonism and Huntington chorea. Findings are in agreement with experiments done in animals in which DPH blocked a neuronal response to dopamine. (30 ref)—*Journal abstract*.

12156. Mielke, D. H. et al. (Tulane U, Medical School) **Butaclamol hydrochloride (AY-23,028): An early evaluation in severely ill schizophrenics.** *Diseases of the Nervous System*, 1975(Jan), Vol 36(1), 7-8.—Investigated the effect of butaclamol hydrochloride (AY-23,028), administered during a 12-wk period, on 6 male and 6 female severely ill schizophrenic patients. All Ss received an initial daily dosage of 2.5 mg, gradually increased to a maximum daily dosage of 100 mg. Results indicate positive behavioral changes beginning at the 20 mg dosage level. Based on global ratings, only 2 Ss showed no significant improvement, while 10 Ss showed slight to marked improvement. Results of the Brief Psychiatric Rating Scale and the Nurses' Observation Scale for Inpatient Evaluation also reflect this clinical improvement. Laboratory findings indicated no abnormal changes. Side effects, similar to those associated with fluphenazine, responded to anticholinergic medication. These preliminary findings suggest that AY-23,028 is an effective antipsychotic drug.—F. L. Beyer.

12157. Morgan, Ben B.; Coates, Glynn D.; Brown, Bill R. & Alluisi, Earl A. (U Louisville, Performance Research Lab) **Effects of symptomatic treatment on sustained performance during illness with phlebotomus fever.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 157.

12158. Noyes, Russell & Dempsey, G. Michael. (U Iowa, Medical School) **Lithium treatment of depression.** *Diseases of the Nervous System*, 1974(Dec), Vol 35(12), 573-576.—Reviews data supporting the antidepressant effect of lithium when administered to depressed patients. Of more than 300 depressed patients treated with lithium, over half received benefit. The methodological deficiencies of the cited research are discussed as well as the ensuing difficulties of interpretation. For example, the duration of treatment was inadequate in many studies; patient selection was a problem in that depressions are heterogeneous; and the tendency toward spontaneous remission complicates results, especially when patient control groups are not utilized. However, it is suggested that the proven efficacy of lithium maintenance in the prevention or attenuation of recurrent episodes of manic-depressive illness may be additional evidence that the drug produces significant antidepressant action. The data suggest that mania and depression have a common pathophysiological substrate. It is concluded that lithium is an effective and safe treatment for depressions of the bipolar variety. Implications of its use are discussed with particular attention to its use among outpatients and among unipolar depressed patients. (35 ref)—R. S. Albin.

12159. Obholzer, A. M. (Tavistock Clinic, London, England) **A follow-up study of nineteen alcoholic patients treated by means of tetraethyl-thiuram disulfide (Antabuse) implants.** *British Journal of Addiction*, 1974(Mar), Vol 69(1), 19-23.—Conducted a follow-up survey on 19 alcoholic patients (18 males, 1 female) in

Volkenberg Hospital, South Africa, upon whom tetraethylthiuram disulfide (Antabuse) implant operations had been performed in 1968-1969. Minimum duration of alcoholism for most Ss had been 15 yrs. The majority were 40-55 yrs old, and 11 were unemployed at time of hospital admission. The interval between operations and follow-up was 2½-12 mo. Of the 19 Ss operated, 13 had maintained sobriety between implant and follow-up and 6 had reverted to drinking. 5 of the relapsed Ss reportedly drank without any disulfiram ethanol reaction; information was lacking on the 6th recidivist. Systematic side effects of the implant were minimal, but local complications, especially sepsis, occurred in 11 cases. Results of this series of implants are compared with those of other studies. The possible reasons for implant success are discussed. An S's faith in the implant appeared to be the only good predictive factor for postoperative sobriety, which was expected to be at best short-term.—A. P. Balevre.

12160. Penna, Manoel W. & Lion, John R. (U Maryland, Medical School, Inst of Psychiatry & Human Behavior, Baltimore) **Gilles de la Tourette's syndrome and depression: A case report.** *Diseases of the Nervous System*, 1975(Jan), Vol 36(1), 41-43.—Considers the diagnosis and treatment of a case of Gilles de la Tourette's syndrome in terms of previous findings. Several hypotheses concerning the depressive effect of haloperidol are discussed. (15 ref)

12161. Raskind, Murray & Bradford, Tamara. (U Washington, Medical School) **Methylphenidate (Ritalin) abuse and methadone maintenance.** *Diseases of the Nervous System*, 1975(Jan), Vol 36(1), 9-12.—Interviewed 40 methadone maintenance patients and 40 "street" heroin addicts in a residential treatment program in the Seattle area to explore differences in methylphenidate abuse. The groups were similar in age, sex, race, and length of treatment variables. In support of previous experience, results indicate that 18 of the methadone group used methylphenidate regularly while only 2 of the "street" group were regular users. The most salient attraction for the drug's abuse among methadone patients was the pleasurable "high" associated with intravenous injection. The medical and social implications of methylphenidate abuse are discussed and the need for methadone maintenance programs to attend to these issues is emphasized.—F. L. Beyer.

12162. Regan, Riley W. (Dept of Health & Mental Hygiene, Div of Alcoholism Control, Baltimore, MD) **An addict joins the professionals: Reflections on both worlds.** In *Selected papers delivered at The Ninth Annual West Virginia School on Alcohol and Drug Abuse Studies*, June 17-22, 1973. Morgantown, WV: West Virginia University, 1973. 165 p.—The author briefly describes his background as a former alcoholic and drug addict and traces his career as a professional in the field of alcoholism and drug-abuse treatment. 4 attributes of professionalism—high degree of knowledge, orientation to community interests, self-control of behavior, and a system of monetary and honorary rewards—are discussed as they apply to individuals and programs confronting the problems of drug abuse and alcoholism.

12163. Shader, Richard I.; Jackson, Anthony H. & Dodes, Lance M. (Massachusetts Mental Health Ctr,

Boston) **The antiaggressive effects of lithium in man.** *Psychopharmacologia*, 1974, Vol 40(1), 17-24.—Notes that, since J. F. Cade's (1949) original suggestions concerning the value of lithium in controlling patients' "ungovernable tempers," considerable evidence has accumulated to support this view. The present report reviews this evidence and describes an illustrative case of a 34-yr-old woman repeatedly hospitalized for antisocial reactions characterized by aggressive assault and destructiveness. The successful use of lithium therapy, as well as some important side effects of the drug, are summarized. (19 ref)—*Journal abstract*.

12164. Silberberg, Norman E. & Silberberg, Margaret C. (Sister Kenny Inst, Minneapolis, MN) **Glue sniffing in children: A position paper.** *Journal of Drug Education*, 1974(Fal), Vol 4(3), 301-308.—Examines the question of whether the preventive measures and cures for glue sniffing are more dangerous than the glue sniffing itself (e.g., by creating an interest in the use of glue). Research is reviewed which indicates that glue sniffing does not seem to occur in isolation but accompanies environmental stress. Clearly, much of the stress is a result of school failure. It is recommended that more energy be devoted to reducing the stress than to dealing with the sniffing itself. (15 ref)—*Journal abstract*.

12165. Sykes, Lantz M. (Greensboro Ctr for Alcohol Rehabilitation, Educational Services, NC) **The Greensboro story.** In *Selected papers delivered at The Ninth Annual West Virginia School on Alcohol and Drug Abuse Studies*, June 17-22, 1973. Morgantown, WV: West Virginia University, 1973. 165 p.—Discusses the development of the Greensboro, North Carolina, alcohol rehabilitation program for use in the local courts to help alleviate the problem of the public drunkenness offender. The 7 elements of the program are described: administration, alcohol education, court class, youth program, industrial programs, and alcoholism detoxification unit.

12166. Thorell, Lars-Hakan & Wretmark, G. (U Linköping, Sweden) **A comparative study of N 7001 (Metrisil®) and imipramine on a series of depressive patients.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(5), 508-515.—Conducted open and double-blind studies of N-7001 and imipramine in 60 psychiatric inpatients with depressive symptoms. Results confirm those of previous studies which showed that N-7001 is as effective as imipramine in the treatment of depressive illness. 5 Ss had to discontinue imipramine treatment because of deteriorated mental status, although none had to be discontinued among those receiving N-7001. Staff ratings after 8 days of treatment indicated improvement among the N-7001 Ss, but not among the imipramine Ss. Data suggest that if the S exhibited obvious neurotic traits, the outcome with N-7001 was worse than if he did not exhibit such symptoms. This finding did not apply to imipramine. Ss rated as inhibited showed better outcomes on N-7001 than those rated as not inhibited. This difference was not significant for imipramine vs N-7001 ( $p < .05$ ).—*Journal abstract*.

12167. Trow, Jesse E. (Dept of Health & Welfare, Program on Alcohol & Drug Abuse, Concord, NH) **Techniques to initiate positive community response.** In *Selected papers delivered at The Ninth Annual West Virginia School on Alcohol and Drug Abuse Studies*, June

17-22, 1973. Morgantown, WV: West Virginia University, 1973. 165 p.—Discusses aspects of a statewide, community-based alcohol and drug-abuse program in New Hampshire. The program aims specifically to work with at least 1 medical doctor in each of the larger communities to motivate and encourage him to participate actively in working with alcoholics and drug-dependent people.

12168. Turek, Ibrahim S. & Rocha, Juracy. (Maryland Psychiatric Research Ctr, Baltimore) **Oral thyrotropin-releasing hormone (TRH) in depressive illness.** *Journal of Clinical Pharmacology*, 1974(Nov-Dec), Vol 14(11-12), 612-616.—Examined the effects of thyroid-release hormone on depressives. The drug failed to change the thyroid function or to improve depression.

12169. van der Velde, Christiaan D. & Kiltie, Harriet. (Norwich Hosp, A. Ribicoff Research Ctr, CT) **Effectiveness of loxapine succinate in acute schizophrenia: A comparative study with thiothixene.** *Current Therapeutic Research*, 1975(Jan), Vol 17(1), 1-12.—Compared the clinical effectiveness of loxapine succinate, a new neuroleptic agent, with the efficacy of thiothixene and placebo during a 6-wk, double-blind study with 76 patients hospitalized with acute symptoms of schizophrenia. Loxapine appeared to be clearly superior to placebo and significantly superior to thiothixene on many items and factors of the Brief Psychiatric Rating Scale and the Nurses' Observation Scale for Inpatient Evaluation. On the Clinical Global Impressions, loxapine was significantly superior to placebo and superior to thiothixene at Weeks 3 and 6. All tests were completed 6 times during the study. No efficacy measure showed superiority of thiothixene over loxapine.—*Journal abstract*.

12170. Vandecasteele, A. J. & Vereecken, J. L. (Psychiatric Hosp "Sancta Maria," Noordwijk, Netherlands) **A double-blind clinical evaluation of penfluridol (R 16 341) as a maintenance therapy in schizophrenia.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(3), 346-353.—Studied 2 groups of female chronic schizophrenic inpatients, all of whom had been successfully maintained on penfluridol for at least 6 mo, to assess the effectiveness of penfluridol as a basic maintenance therapy. Group I (10 patients) received penfluridol, and Group II (11 patients) received placebo under double-blind conditions for 6 mo. Patients were evaluated using a 36-item questionnaire completed before and after 1, 3, 4 and 6 mo of treatment. When at any time during the study a patient deteriorated, haloperidol in individually adjusted doses was added to her treatment regimen. By the end of the study, 8 of the 11 placebo patients received additional haloperidol, whereas only 3 of the penfluridol patients did. Evaluation of the scores on the rating scale showed no significant differences between the 2 treatment groups. The trial confirmed previously gained experience that penfluridol is a suitable drug for the maintenance therapy of chronic schizophrenic patients. (15 ref)—*Journal abstract*.

12171. Ylialo, Eugene. (Appalachian Regional Hosp, AR-CAP, Beckley, WV) **A basis for advocacy: Alcoholism intervention.** In *Selected papers delivered at The Ninth Annual West Virginia School on Alcohol and Drug Abuse Studies*, June 17-22, 1973. Morgantown, WV: West Virginia University, 1973. 165 p.—Considers

alcoholism as a treatable, chronic illness and argues that a comprehensive, long-term intervention program is necessary for its treatment. 8 components of service provided by the Appalachian Regional Comprehensive Alcoholism Program are detailed, national and state laws concerning the problem are discussed, and further legislation and implementation of the laws are urged.

### Behavior & Group Therapy

12172. Alexander, James F. (U Utah) **Behavior modification and delinquent youth.** In J. G. Cull & R. E. Hardy (Eds), *Behavior modification in rehabilitation settings: Applied principles*. Springfield, IL: Charles C Thomas, 1974. xvii, 251 p.

12173. Ascher, L. Michael & Cautela, Joseph R. (Eastern Pennsylvania Psychiatric Inst, Philadelphia) **An experimental study of covert extinction.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Dec), Vol 5(3-4), 233-238.—A 2 x 3 study, using performance on a pseudo concept-formation task as the dependent variable, tested the efficacy of covert extinction (CE). 6 groups of 15 college students each received either CE instructions, overt extinction (OE) instructions, or no instructions, and either reinforcement or no reinforcement. Data reveal no significant difference between the unreinforced CE and OE groups but do indicate significant differences between these groups and the unreinforced group receiving no instructions. Parallel results were obtained for the 3 similar reinforced groups. The conclusion, based on these data, is that CE was effective in facilitating the course of extinction whether or not the environment continued to provide reinforcement for the specific response.—*Journal abstract*.

12174. Balch, Philip & Ross, A. William. (U Arizona) **A behaviorally oriented didactic-group treatment of obesity: An exploratory study.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Dec), Vol 5(3-4), 239-243.—Applied a behaviorally oriented didactic-group approach to the treatment of obesity with a diverse population of female employees and patients in a medical school setting. Group I (19 Ss, full treatment), Group II (15 Ss, partial treatment), and Group III (11 no-treatment controls) were compared in numbers of pounds and percent body weight lost over a 9-wk treatment program, the goals of which were 1-2 lb weekly weight loss. Findings reveal significant differences between Group I vs II and III, but not between Groups II and III. The weight loss for the full treatment group (mean loss = 10.6 lb) was consistent with the goals of the program, and results of the 6-wk follow-up indicate that Group I members acquired the skills necessary to maintain weight loss and/or continue gradual reduction. The applicability of the current program to the increasing numbers of obese as well as the possibility of paraprofessionals leading such programs are discussed.—*Journal abstract*.

12175. Battagay, Raymond. (U Basel, Psychiatric Clinic, Switzerland) **Group psychotherapy as a method of treatment in a psychiatric hospital.** In S. de Schill (Ed), *The challenge for group psychotherapy: Present and future*. New York, NY: International Universities Press, 1974. xxviii, 366 p.

12176. **Bellack, Alan S.; Schwartz, Jeffrey & Rozensky, Ronald H.** (U Pittsburgh, Clinical Psychology Ctr) **The contribution of external control to self-control in a weight reduction program.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Dec), Vol 5(3-4), 245-249.—A weight reduction program emphasizing self-control was presented to 20 volunteers (mean age = 28 yrs) under 3 different conditions. One group met weekly with E and received mild social reinforcement for progress. A 2nd group had contact only by mail. They self-monitored food intake and mailed the records to E daily; he mailed a new supply of envelopes back to them each week. A 3rd group had no ongoing contact. There were no differences in weight loss between the contact groups, and both lost significantly more weight than the no-contact group. Results are discussed in terms of the information value or signaling function of external contact in treatment programs emphasizing self-control. (16 ref)—*Journal abstract*.

12179. **Boszormenyi-Nagy, Ivan.** (Eastern Pennsylvania Psychiatric Inst, Family Psychiatry Div, Philadelphia) **Ethical and practical implications of intergenerational family therapy.** *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 261-268.—Defines and discusses the nature of intergenerational family therapy (IFT). The essence of IFT is viewed as the scope of the therapist's responsibility and commitment, rather than as an outcome of specific techniques. The ethical position of a therapist contracting for care of an entire family is contrasted with that of the individual therapist. The family system is compared with a ledger of accounts, and the importance of understanding the impact of an imbalanced relationship of 1 generation on a family member of the next generation is stressed. The integrated therapeutic framework offered by IFT is concluded to hold possibilities for the redefinition of concepts in the fields of health, pathology, prevention, individual legal rights, and international relations.—*R. Tomasko*.

12180. **Bouchal, M.; Dufková, D.; Robeš, M. & Sekaninová, Z.** (U Jan Evangelista Purkyně, Brno, Czechoslovakia) **[Thematic psychotherapeutic group.]** (Czec) *Československá Psychiatrie*, 1973(Jun), Vol 69(3), 163-169.—Describes the functioning of thematic group therapy with ambulatory and hospitalized neurotics. At the beginning of each psychotherapeutic session the therapist selected for group discussion one of the following categories of themes: childhood memories and fantasy life; attitudes and emotions; topics related to the body and somatic functions; interests and social situations; or interpersonal relations. In another alternative, the therapist asked the group to participate in nonverbal expressive behavior. Thematic psychotherapy was found particularly suitable for open groups of beginners because it prevented the accumulation of tension and

anxiety, which inhibit active group involvement by all participants. (Russian & English summaries)—*V. Fischmann*.

12184. **Bunker, Douglas R.** (State U New York, Buffalo) **Social process awareness training: An NTL approach.** In D. S. Milman & G. D. Goldman (Eds), *Group process today: Evaluation and perspective*. Springfield, IL: Charles C Thomas, 1974. xxii, 313 p.

12185. **Calef, Ruth A. et al.** (West Virginia Wesleyan Coll) **Facilitation of group desensitization of test anxiety.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1285-1286.—To enhance the effects of group desensitization in the treatment of test anxiety, a modified desensitization procedure was used, calling for pairing a stimulus (tone) with relaxation training, then presenting the stimulus while Ss completed the test-anxiety hierarchy. 60 college freshmen with high scores on the Text Anxiety Scale were divided into 4 groups of 15 Ss each. One group received the modified group-desensitization procedure while a 2nd group received conventional group desensitization. 2 control conditions were included: presentation of a tone while completing the test-anxiety hierarchy, and an attention-placebo condition. The modified desensitization procedure was more effective than conventional desensitization and the control conditions.—*Journal abstract*.

12186. **Cautela, Joseph R.** (Boston Coll) **The use of covert conditioning in hypnotherapy.** *International Journal of Clinical & Experimental Hypnosis*, 1975(Jan), Vol 23(1), 15-27.—Covert conditioning involves the manipulation of imagery to modify behaviors such as phobias, alcoholism, and sexual deviations. A rationale and description of covert conditioning procedures are described, and covert conditioning and hypnotic induction procedures employing imagery are compared. The advantages and disadvantages of combining covert conditioning and hypnosis are discussed. It is concluded that some of the issues raised in this paper can only be resolved by controlled research. (German, French, & Spanish summaries) (40 ref)—*Journal abstract*.

12187. Chazan, Rachel. (Kfar Shaul Government Hosp. Jerusalem, Israel) **A group family therapy approach to schizophrenia.** *Israel Annals of Psychiatry & Related Disciplines*, 1974(Sep), Vol 12(3), 177-193.—Describes a study based on 4 years' work with a multiple family therapy group on an acute psychiatric admission unit. The group was run as an open one; families were asked to participate together with the admitted patient. The rationale was to treat the family structure as "patient," to look for and point out disturbance in family relationships. One of the aims was to encourage free expression of emotion in the group. Families had been avoiding such expression and apparently regarded it as dangerous. An attempt was also made to reactivate interpersonal conflict, which had been largely converted into intrapsychic conflict concentrated in the sick member. Aspects of resistance to the group and manifestations of the pathological family process in the group are discussed, as well as the special feature of such a multiple group compared to work with individual families. (22 ref)—*Journal abstract*.

12188. Creer, Thomas L.; Weinberg, Eugene & Molk, Leizer. (Children's Asthma Research Inst & Hosp, Denver, CO) **Managing a hospital behavior problem: Malingering.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Dec), Vol 5(3-4), 259-262.—Notes that malingering can pose a serious problem to attending medical personnel. A technique employed at the Children's Asthma Research Institute and Hospital (CARIH) to successfully modify this behavioral pattern—time-out from positive reinforcement—is described as used with a 10-yr-old male with intractable bronchial asthma. In addition, procedures are presented both for shaping up socially appropriate behaviors and for insuring that gains are maintained when the S returns home.—*Journal abstract*.

12196. Farrall, William R. (Farrall Instrument Co, Grand Island, NB) **Selection and use of stimulus material for aversion therapy and desensitization.** *Behavioral Engineering*, 1973(Sum), Vol 1(1), 1-7.—Discusses aversive conditioning and systematic desensitization as techniques in the treatment of various sexual disorders and phobias. A description of apparatus and procedure is given. In aversion therapy the main emphasis should be transferred from the aversion stimuli to the aversion-relief stimuli. The functions of both sets of stimuli are discussed. A step-by-step description of the treatment of a child molester and his family shows the method in use. The preparation and use of photographs and slides for aversion therapy are discussed in detail.—*A. Debons*.

12197. Forehand, Rex; Cheney, Thomas & Yoder, Pam. (U Georgia) **Parent behavior training: Effects on the non-compliance of a deaf child.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Dec), Vol 5(3-4), 281-283.—Examined the effects of a parent-centered behavioral training program on the noncompliance of a 7-yr-old deaf male. The program, which was designed to alter general parent-child interactions, involved initially teaching the mother reinforcement skills for desirable behavior and, subsequently, a time-out procedure for deviant behavior. Results indicate that a general behavioral program could be rapidly learned by a mother and applied to the special problems of a deaf child. Changes occurred in both the child's compliance and in the mother's behavior and attitudes toward the child.—*Journal abstract*.

prehensive research review. *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 130-131.

12200. **Hedberg, Allan G. & Campbell, Lowell.** (Schick Hosp, Fort Worth, TX) **A comparison of four behavioral treatments of alcoholism.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Dec), Vol 5(3-4), 251-256. —45 male and 4 female alcoholics (mean age = 38 yrs) were administered either a behavioral family counseling, systematic desensitization, covert sensitization, or a shock presentation treatment program. The treatment program was conducted in an outpatient setting using both professional and paraprofessional therapists. Each S's therapy regime adhered to a standardized sequence of treatment sessions over a 1-yr period. Additionally, each S was offered the opportunity to establish a treatment goal of either controlled drinking or complete abstinence. Data indicate that behavioral family counseling was the most effective alcoholism treatment method of the 4 procedures studied. Systematic desensitization was highly effective in modifying excessive alcohol consumption, with covert sensitization being only moderately effective. Presentation of shock resulted in little behavior change, suggesting that the procedure may have only limited utility for alcoholism treatment in an outpatient facility. Controlled drinking appeared to be an appropriate and practical treatment alternative to the traditional treatment program requirement of complete abstinence. Implications for the operation of behavioral alcoholism treatment programs in outpatient facilities are summarized and discussed. (31 ref)—*Journal abstract*.

12201. **Herman, Steven H. & Prewett, Michael.** (VA Hosp, Miami, FL) **An experimental analysis of feedback to increase sexual arousal in a case of homo- and heterosexual impotence: A preliminary report.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Dec), Vol 5(3-4), 271-274. —The effect of informational feedback concerning level of penile responding on subsequent sexual arousal was examined in a case of homo- and heterosexual impotence in a 51-yr-old male. Penile response to slides of nude males and nude females during separate measurement sessions without feedback was significantly increased during a phase where treatment sessions contained contingent feedback, decreased when feedback was administered noncontingently, and increased once again when contingent feedback was reinstated. The increase in penile responding was paralleled by achievement of ejaculation during masturbation, changes in masturbatory fantasy, and reports of homo- and heterosexual arousal outside the laboratory. —*Journal abstract*.

12202. **Hoerl, Richard T.** (Denver General Hosp, CO) **Encounter groups: Their effect on rigidity.** *Human Relations*, 1974(May), Vol 27(5), 431-438. —Studied changes in flexibility, as measured by the Flexibility and Tolerance for Ambiguity scales of the California Personality Inventory, in 112 encounter group participants. Significant differences were found between volunteer and nonvolunteer groups but not between encounter and nonencounter groups. It is concluded that treatment effects depend more on who attends the group than on what is done. People who volunteer for encounter groups are already more flexible than those who do not.—*W. W. Meissner*.

12203. **Hogan, Peter.** (New York U-Bellevue Medical Ctr, NY) **Some aspects of my theory and practice of therapy.** In D. S. Milman & G. D. Goldman (Eds), *Group process today: Evaluation and perspective*. Springfield, IL: Charles C Thomas, 1974. xxii, 313 p.

12204. **Horan, John J.; Baker, Stanley B.; Hoffmann, Alan M. & Shute, Robert E.** (Pennsylvania State U) **Weight loss through variations in the covert control paradigm.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 68-72. —Assigned 40 overweight female Ss to 1 of 8 treatment combinations in a  $2 \times 2 \times 2$  matrix. The use of positive coverants produced significantly ( $p < .005$ ) more weight loss than negative coverants. No differences were found between those Ss employing highly probable eating and noneating behaviors. Group counseling enabled a larger percentage of Ss to lose at least 1 lb/wk than did individual intervention followed by self-management. It is suggested that L. E. Homme's paradigm should be shortened to 3 steps when applied to the problem of weight loss since certain treatment combinations were nearly 100% effective. (15 ref)—*Journal abstract*.

12205. **Horan, John J.; Hoffman, Alan M. & Macri, Marygrace.** (Pennsylvania State U) **Self-control of chronic fingernail biting.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Dec), Vol 5(3-4), 307-309. —Volunteer chronic fingernail biters participated in a behavioral program that employed self-monitoring, self-punishment, and self-reward techniques. Gains persisted through a follow-up evaluation, indicating the comprehensive self-control program to be highly effective.

12206. **Houston, Fred.** (McMaster U, Hamilton, Ontario, Canada) **Respiratory relief treatment of a case of phobia with spasmodic torticollis.** *Canadian Psychiatric Association Journal*, 1974(Jun), Vol 19(3), 305-307. —Tried an aversive conditioning treatment with a 28-yr-old married woman who suffered from phobias and from torticollis. During the 5th session of therapy, the patient suddenly recalled with excitement a forgotten childhood incident. After this abreaction, the torticollis disappeared and did not return during a 6-mo follow-up period. (French summary)—*F. Auld*.

12207. **Hymowitz, Arthur E. & Hymowitz, Norman.** (Coll of Medicine & Dentistry of New Jersey) **Operant conditioning of feeding in a blind profoundly retarded girl.** *Indian Journal of Mental Retardation*, 1974(Jul), Vol 7(2), 58-64. —Describes the successful use of behavior modification procedures to restore feeding behavior in a recently blind 11-yr-old profoundly retarded female. The patient was rewarded by being allowed to play a music box. Despite the girl's progress, she was withdrawn from the program after 14 days of treatment when her mother observed one of the nurses scolding and shaking her. The importance of staff cooperation is emphasized.—*J. H. Pflaum*.

12208. **Kazdin, Alan E.** (Pennsylvania State U) **Comparative effects of some variations of covert modeling.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Dec), Vol 5(3-4), 225-231. —In covert modeling, Ss imagine a model rather than observe a live or film model. In a  $2 \times 2$  design, multiplicity of models (imagining 1 vs 3 different models) and variation of fear stimuli (imagining the model perform with 1 vs 2

different snakes) were combined in a study with 52 snake-phobic undergraduates. A no-model control group of 16 Ss was included in the design to control for fear-related imagery in the absence of a model. Ss who imagined multiple models, as opposed to a single model, showed greater avoidance reduction on behavioral and self-report measures at posttreatment and at a 3-wk follow-up assessment. Ss who imagined a single snake and those who imagined different snakes were not different in avoidance. In general, results support the efficacy of covert modeling over no-model controls. (21 ref)—*Journal abstract*.

12209. Krasner, Jack D. (Iona Coll) **Analytic group psychotherapy with the aged.** In S. de Schill (Ed), *The challenge for group psychotherapy: Present and future*. New York, NY: International Universities Press, 1974. xxviii, 366 p.

12210. Le Boeuf, Alan. (St Brendan's Hosp, Dublin, Ireland) **An automated aversion device in the treatment of a compulsive handwashing ritual.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Dec), Vol 5(3-4), 267-270.—A 49-yr-old male with a 25-yr history of compulsive handwashing was treated by the implementation of a self-control procedure. Treatment was effective only when a powerful external reinforcer (shock) was added to the procedure to increase the patient's capacity for initiating self-control. Ritualistic handwashing had virtually ceased after 42 days and remained absent at a 12-mo follow-up.—*Journal abstract*.

12211. Lebovici, Serge. (U Paris, France) **A combination of psychodrama and group psychotherapy.** In S. de Schill (Ed), *The challenge for group psychotherapy: Present and future*. New York, NY: International Universities Press, 1974. xxviii, 366 p.

12212. Lehman, Robert E. (U Idaho) **The disinhibiting effects of visual material in treating orgasmically dysfunctional women.** *Behavioral Engineering*, 1974(Fal), Vol 1(2), 1-3.—Discusses the value of visual material in disinhibiting sexual attitudes and behaviors in orgasmically dysfunctional females, with emphasis on changing the negative attitudes towards self-stimulation. The use of an automatically timed slide projector, the importance of a female being on the staff, and the length of presentation are discussed. Components of desensitization, modeling, and vicarious learning are presented as possible causes for the success of the program to date.—A. Debons.

12213. Longin, Harold E.; Kohn, James P. & Macurik, Kenneth M. (Weston State Hosp, WV) **The modification of choreal movements.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Dec), Vol 5(3-4), 263-265.—Used training in an incompatible response to decrease the symptomatic movements associated with Sydenham's Chorea in a 63-yr-old male psychotic inpatient. Training was conducted for 30 sessions on a lever pullbutton press apparatus. Results indicate a decrease in inappropriate spasmodic movements both during the treatment sessions and on the ward. Results were maintained 16-20 wks after treatment termination.—*Journal abstract*.

12222. Milman, Donald S. & Goldman, George D. (Eds). (Adelphi U) **Group process today: Evaluation and perspective.** Springfield, IL: Charles C Thomas, 1974. xxii, 313 p.—Presents a collection of 19 papers on recent research, theory, and practice in group process techniques and therapy. Topics include rationality and irrationality in the group therapy process, a conceptual model of group psychoanalysis, social process awareness training, and the use of videotaping in group psychotherapy.

12223. Mintz, Elizabeth E. **Marathon groups as intensive psychotherapy.** In D. S. Milman & G. D. Goldman (Eds), *Group process today: Evaluation and perspective*. Springfield, IL: Charles C Thomas, 1974. xxii, 313 p.

12224. Mitchell, Kenneth R. & Orr, Fred E. (U New South Wales, Kensington, Australia) **Note on treatment of heterosexual anxiety using short-term massed desensitization.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1093-1094.—Conducted a study of 29 undergraduate males who reported having difficulty in social situations to examine methods of reducing heterosexual anxiety. Ss were assigned to either traditional desensitization, short-term desensitization, relaxation training, or no-treatment groups. Data from traditional and short-term desensitization procedures show decreased anxiety associated with paper-and-pencil measures of heterosexual interactions. However, the 2 desensitization groups were not significantly different, and a relaxation and a no-treatment group did not differ in reports.—*Journal abstract*.

12225. Moser, Adolph J. (Indiana Youth Ctr, Psychology Section, Plainfield) **Covert punishment of hallucinatory behavior in a psychotic male.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Dec), Vol 5(3-4), 297-299.—A 24-yr-old male paranoid schizophrenic inpatient exhibiting hallucinatory behavior was subjected to a self-monitoring procedure utilizing covert punishment. In an own-control, AB design, the application of covert punishment eliminated reported hallucinations. Other favorable changes in behavior also occurred.—*Journal abstract*.

12226. Neumann, M. & Goni, B. (Shalvata Hosp, Hod Hasharon, Israel) **Types of patients especially suitable for analytically oriented group psychotherapy: Some clinical examples.** *Israel Annals of Psychiatry & Related Disciplines*, 1974(Sep), Vol 12(3), 203-215.—Briefly reviews the different attitudes toward group therapy in the literature. Analytically oriented group therapy is seen as a treatment in its own right, equal in value to individual therapy and in some cases as the treatment of choice. 6 types of patients for whom group therapy has distinct advantages are described and clinical examples given. These types do not fit any known nosological categories but are characteristic of patterns of behavior and specific personality makeups. (22 ref)—*Journal abstract*.

12227. Nielsen, Eggert. [7th Scandinavian Mental Health Seminar.] (Swed) *Psykisk Hälsa*, 1972, Vol 13(2), 133-154.—Describes proceedings of a seminar on family therapy. Topics included theories and explanatory models, the 1st contact, and special techniques for conducting this therapy.

12228. Nimmer, William H. & Kapp, Richard A. (Brooke Army Medical Ctr, Ft Sam Houston, San Antonio, TX) **A multiple impact program for the treatment of injection phobias.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Dec), Vol 5(3-4), 257-258.—3 female college students with longstanding histories of aversive reactions to injections were treated by a multifaceted program consisting of prolonged presentations of hierarchical stimuli, in vivo work, modeling, and "homework." An average of 5

sessions was needed to complete therapy. Follow-up contacts 6 mo after therapy indicated that there had been no return of the original aversive reactions.—*Journal abstract*.

12229. Ortlieb, P. [Social-psychological observations on the cathartic effects of aggressive behavior.] (Germ) *Zeitschrift für Klinische Psychologie und Psychotherapie*, 1973, Vol 21(4), 329-334.—Surveys old and new theories on the subject. It is suggested that factors of social learning are more effective in matters of behavior modification and reduction of aggression than the systematically provoked abreaction of determinant factors. Successful behavior modification can be achieved best through replacing the utilitarian value of aggression by newly developed preferable behavior alternatives. (English summary) (46 ref)—T. Fisher.

12230. Paterson, Gerry. (U Alberta, Edmonton, Canada) **A historical review and classification system of the new group therapies.** *Western Psychologist*, 1973, Vol 4(3), 79-87.—Briefly reviews the history of group therapy, and proposes a classification system for current group therapy methods. Groups are placed on a continuum, from Tavistock groups to Reichian groups, which fall into 3 categories; those emphasizing (a) group processes, (b) interpersonal relationships, and (c) intrapersonal relationships. The categories take different views of how man is controlled: by external forces (group processes category), by internal forces (intrapersonal relationships) or by both (interpersonal relationships). It is emphasized that all workers in the social sciences must become familiar with group therapies, which are now a permanent aspect of psychology.—D. R. Evans.

12231. Pierrakos, John C. **Observations and techniques in bioenergetic group therapy.** In D. S. Milman & G. D. Goldman (Eds), *Group process today: Evaluation and perspective*. Springfield, IL: Charles C Thomas, 1974. xxii, 313 p.

12232. Prochaska, James et al. (U Rhode Island) **Remote-control aversive stimulation in the treatment of head-banging in a retarded child.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Dec), Vol 5(3-4), 285-289.—Response-contingent shock has been demonstrated to reduce the rate of head-banging, but poor generalization has frequently resulted. The treatment of a 9-yr-old profoundly retarded, head-banging female demonstrated similar problems with generalization when stationary shock equipment was used, but remote-control apparatus was able to overcome generalization problems and reduce head-banging to zero.—*Journal abstract*.

12233. Ramsey, Gregory. (Hogan Regional Ctr, Hathorne, MA) **Use of electric shock in the classroom: The remediation of self-abusive behavior.** *Behavioral Engineering*, 1974(Fal), Vol 1(2), 4-9.—Describes the successful use of a portable shock apparatus to eliminate the self-abusive behavior of an 11-yr-old retarded child in the classroom. Several other positive side effects were noted: a decrease in aggression by the child toward others, improvement in academic performance, and an increase in command-following behavior. However, the effects were severely limited in that there was no generalization beyond the classroom. No negative side

effects were observed for either the child or the other children in the class.—*Journal abstract.*

12234. Rimm, David C.; Saunders, William D. & Westel, William. (Southern Illinois U, Carbondale) **Thought stopping and covert assertion in the treatment of snake phobias.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 92-93.—Evaluated the use of thought stopping and covert assertion in treating the snake phobias of 21 female undergraduates using 4 behavioral avoidance tests and the Fear Survey Schedule. Findings suggest that the thought-stopping-covert-assertion treatment package holds considerable promise as an efficient and effective clinical tool.

12235. Rosenbaum, Max. **An overview of group psychotherapy and the present trend.** In D. S. Milman & G. D. Goldman (Eds), *Group process today: Evaluation and perspective.* Springfield, IL: Charles C Thomas, 1974. xxii, 313 p.

**ic institute.** In S. de Schill (Ed), *The challenge for group psychotherapy: Present and future.* New York, NY: International Universities Press, 1974. xxviii, 366 p.

12244. Spontitz, Hyman. **Group psychotherapy with schizophrenics.** In D. S. Milman & G. D. Goldman (Eds), *Group process today: Evaluation and perspective.* Springfield, IL: Charles C Thomas, 1974. xxii, 313 p.

12245. Turner, R. K.; Pielmaier, H.; James, S. & Orwin, A. (U Leicester, School of Social Work, England) **Personality characteristics of male homosexuals referred for aversive therapy: A comparative study.** *British Journal of Psychiatry*, 1974(Nov), Vol 125, 447-449.—Compared male homosexuals who were in aversive therapy treatment ( $n = 51$ ), had previously been in treatment ( $n = 42$ ), or had never received treatment ( $n = 18$ ) with respect to 2 personality measures—the Eysenck Personality Inventory and the Sixteen Personality Factor Questionnaire. Those who sought treatment for homosexuality were found to differ significantly from nonpatient homosexuals who had never sought treatment. The data are interpreted as evidence in support of the hypothesis that personality characteristics are significant in candidacy for treatment.—*Journal summary.*

12246. van den Blink, A. J. (Trinity Counseling Service, Princeton, NJ) **Family therapy and pastoral care.** *Journal of Pastoral Care*, 1974(Sep), Vol 28(3), 183-198.—Discusses the history and characteristics of family therapy, illustrating its main themes by examples of the work and thought of several therapists. The implications as to pastoral initiative, religious experience, and training for pastoral care are considered.

12247. Vassiliou, George. (Athenian Inst of Anthropos, Greece) **What general systems theory offers to the group therapist.** *International Mental Health Research Newsletter*, 1973(Win), Vol 15(4), 8-9.—Outlines advantages and risks of General Systems Theory (GST) for group therapists. In particular, while GST clearly defines the role of the therapists, it also challenges the therapist to become a model of proper human functioning, maintaining organization in openness, and openness in organization.

12248. Watson, J. P. & Lacey, J. H. (Guy's Hosp Medical School, London, England) **Therapeutic groups for psychiatric in-patients.** *British Journal of Medical Psychology*, 1974(Dec), Vol 47(4), 307-312.—Conducted a study of 12 psychiatric inpatients and staff to test the hypotheses that (a) therapeutic groups would have an anxiety-provoking effect such that patients would rate themselves as more anxious after than before participation in the groups, and more anxious after than before control periods; and (b) participants would rate groups as "good" when they felt less anxious at the end of sessions than before them. Results indicate that patients were significantly more anxious before and after groups than before and after control periods, and also after groups than before them. "Good" groups tended to be those associated with anxiety relief. Factors contributing to these results are discussed.—*Journal summary.*

12249. Wieman, Robert J.; Shoulders, David I. & Farr, Jo-Ann H. (Norristown State Hosp, PA) **Reciprocal reinforcement in marital therapy.** *Journal of Behavior Therapy & Experimental Psychiatry*, 1974(Dec), Vol 5(3-4), 291-295.—Extends R. B. Stuart's (see PA, Vol

44:3932) behavior exchange model of marital therapy to include the supplementary use of both communication and sexual skill training. The approach is exemplified by the case study of a 31-yr-old couple who had sought help in resolving marital conflict. The treatment follows a multiple-baseline design across different behaviors. Results confirm the efficacy of the approach in positively modifying the behavior patterns of distressed spouses.—*Journal abstract.*

12250. Wilder, Joseph. (New York Medical College, NY) **Group analysis and the insights of the analyst.** In S. de Schill (Ed), *The challenge for group psychotherapy: Present and future.* New York, NY: International Universities Press, 1974. xxviii, 366 p.

12251. Williams, J. David & Martin, Randall B. (Northern Illinois U) **Immediate versus delayed consequences of stuttering responses.** *Journal of Speech & Hearing Research*, 1974(Dec), Vol 17(4), 569-575.—Conducted a study in which 12 young adult stutterers read a list of 50 sentences 5 consecutive times. Frequency of stuttering was studied when (a) electric shock was administered contiguous to each observed occurrence of stuttering on a word; (b) each S received a shock for each word stuttered during the reading of a sentence, but the shocks were not delivered until the sentence was completed; and (c) no shock was employed (control condition). No significant difference was found between the 2 shock conditions, but there was significantly less stuttering throughout the shock conditions than in the control condition, and significant adaptation occurred in all 3 conditions. The hypothesis of a greater punishment effect occurring under contiguous shock than under noncontiguous (delayed) shock was not supported. (16 ref)—*Journal abstract.*

12252. Wolf, Alexander. (New York Medical College, NY) **Psychoanalysis in groups.** In S. de Schill (Ed), *The challenge for group psychotherapy: Present and future.* New York, NY: International Universities Press, 1974. xxviii, 366 p.

12253. Wolpin, Milton & Kirsch, Irving. (U Southern California) **Visual imagery, various muscle states and desensitization procedures.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1143-1149.—30 psychiatric technicians and nurses were asked to imagine 8 different scenes in each of 3 conditions: muscle relaxation, muscle tension, and usual muscle state. Degree of muscle tension significantly affected the quality of the imagery. Tension resulted in images which were described as more active, more frightening, more out of proportion, less friendly, less attractive, and as containing louder sounds and poorer solutions. Ss also reported feeling more a part of the scene and less safe in the tension condition. No significant differences were found in the vividness or clarity of imagery among 3 conditions. Implications for desensitization and related therapies are discussed.—*Journal abstract.*

### Psychoanalysis

12254. Ammon, Günter. (Deutschen Akademie für Psychoanalyse, Lehr- und Forschungsinstitut für Dynamische Psychiatrie und Gruppendynamik, Berlin, W Germany) **What is psychoanalytic therapy?** *Psychotherapie & Psychosomatics*, 1974, Vol 24(4-6), 355-358.—Views

the goal of psychoanalytic therapy as helping the patient free himself from the unconscious compulsions expressed in his symptomatic behavior. In addition to symptom-removal, the patient is expected to understand the personal meaning of the symptom, the communication it contains, and the motive it expresses. The range of psychoanalytic therapy formats is considered to reflect alternative interpersonal situations facilitating the integration of a patient's unconscious with his actual experiences. The role of language as the medium of the therapeutic process is discussed, and its dual nature of ego-definition and ego-extension is described. Psychoanalytic therapy is seen as focusing on the sick person rather than the illness.—*R. Tomasko.*

12255. Baudry, Francis. **Remarks on spoken words in the dream.** *Psychoanalytic Quarterly*, 1974(Oct), Vol 43(4), 581-605.—Examines the hypothesis proposed by O. Isakower that "spoken words in the dream are a direct contribution from the superego to the manifest content of the dream." Careful evaluations of patients' dreams indicates that spoken words do not express superego content, but are closer to a daydream—a continuation of some presleep preoccupation, with the mental apparatus not yet sufficiently regressed to allow visual imagery. It is suggested that conflicts involving the issue of guilt do not always occur in the analysis of dreams with spoken words, and that important elements of drive and defense also contribute to the meaning and form. Such dreams are particularly noted in patients who cannot tolerate regression. It is concluded that the multiple role of speech is reflected in its multiple meaning in the dream.—*J. Z. Elias.*

12256. Calogeras, Roy C. (US Army Hosp, Frankfurt/Main, W Germany) **Lévi-Strauss and Freud: Their "structural" approach to myths.** *American Imago*, 1973(Spring), Vol 30(1), 57-79.—Compares and discusses aspects of Lévi-Strauss's and Freud's structural approaches to mythical thinking. Specifically, the Oedipus myth and the Asdiwal myth of the Tsimshian tribes of the Pacific Northwest are examined. Similarities between the methods and research strategies of both are noted. Both Lévi-Strauss's model and the psychoanalytic model search for unconscious or latent meaning of the individual and collective dream. Lévi-Strauss's codes and Freud's dream-work are compared with regard to their structural components. Their concepts of the relationship between myth/dream and sociocultural reality are compared. Biases and problems within the work of each man are noted. (28 ref)—*R. S. Albin.*

12257. Easser, B. Ruth. **Empathic inhibition and psychoanalytic technique.** *Psychoanalytic Quarterly*, 1974(Oct), Vol 43(4), 557-580.—Discusses the usual treatment difficulties met in the psychoanalysis of the narcissistic personality disorder. Such patients have repressed their capacity for empathic response as a defense to protect oedipal triumph. This illusion of oedipal triumph is essential for maintaining their primary omnipotency core. Such a grandiose self-concept, with its roots in early development, protects the patient against the confusing early mother-child relationship, which was experienced by the child as threatening because of the irreconcilability of what he perceived and what he was told. The retention of omnipotence

preserves him against overwhelming helplessness and anxiety as he is flooded with tension in the face of the conflicting stimuli which cannot be organized.—J. Z. Elias.

12258. Falk, Avner. **Border symbolism.** *Psychoanalytic Quarterly*, 1974(Oct), Vol 43(4), 650-660.—Psychoanalytically examines the meanings of dreams and the symbolisms of crossing borders.

12259. Fischer, Newell. **Multiple induced abortions: A psychoanalytic case study.** *Journal of the American Psychoanalytic Association*, 1974, Vol 22(2), 394-407.—Presents the case of a young married woman who had 5 induced abortions. The patient's unconscious fantasies and conflicts are described and clarified in an attempt to underscore the multifaceted and complex determinants of this ego-dystonic pattern of behavior. Such psychoanalytic investigation, it is hoped, will stimulate the interest of analysts in the new pattern of wholesale abortions.—*Journal summary.*

12260. Gilberg, Arnold L. (Southern California Psychoanalytic Inst, Beverly Hills) **Asceticism and the analysis of a nun.** *Journal of the American Psychoanalytic Association*, 1974, Vol 22(2), 381-393.—Surveys the psychoanalytic literature on asceticism and presents the case history of a nun, with special attention to the ascetic motivation, through the early, middle, and terminal phases of her analysis. Whereas asceticism has been viewed as a core oedipal problem, this case suggests that early pregenital traumata are also important in the ascetic search. The oedipal phases of development cannot be synthesized until these pregenital needs are resolved. (19 ref)—*Journal summary.*

12261. Goldberg, Arnold I. (Michael Reese Hosp, Inst for Psychiatric & Psychosomatic Research & Training, Chicago, IL) **On the prognosis and treatment of narcissism.** *Journal of the American Psychoanalytic Association*, 1974, Vol 22(2), 243-254.—Points out how the work of H. Kohut follows directly from and expands upon the concepts expressed by Freud regarding narcissism. Basic definitions and a reorientation are followed by a clinical example. The implications for psychoanalytic theory are discussed.—D. R. Marino.

12262. Keiser, Sylvan. (Brookdale Hosp Medical Ctr, Brooklyn, New York) **Sociologic variables and their effect on the language of the psychoanalytic patient.** *Journal of the American Psychoanalytic Association*, 1974, Vol 22(2), 329-343.—Contends that cultural disparity influences the development of speech and the quality of the intellectual processes. In turn, both of these influence the psychoanalytic process, particularly by facilitating or hindering communication between analyst and analysand. (15 ref)—*Journal summary.*

12263. Kernberg, Otto F. (Columbia U, Coll of Physicians & Surgeons) **Contrasting viewpoints regarding the nature and psychoanalytic treatment of narcissistic personalities: A preliminary communication.** *Journal of the American Psychoanalytic Association*, 1974, Vol 22(2), 255-267.—Examines the areas of agreement and disagreement regarding the metapsychological assumptions and treatment of narcissistic personalities. Discussion includes the relationship of narcissism to borderline conditions and the psychoses, and the relationship of normal to pathological narcissism. Psychoanalytic techniques, narcissistic transference, and the prognosis of narcissism, treated and untreated, are considered.—D. R. Marino.

12264. Miller, Frank & Bashkin, Edmund A. **Depersonalization and self-mutilation.** *Psychoanalytic Quarterly*, 1974(Oct), Vol 43(4), 638-649.—Discusses the problem of severe self-mutilation in psychotic patients, illustrated by a case history with a psychoanalytic theoretical interpretation.

12265. Rosenkötter, Lutz. [The psychoanalytical situation as the basis for psychoanalytical therapy.] (Germ) *Praxis der Psychotherapie*, 1973(Aug), Vol 18(4), 173-181.

12266. Schwartz, Lester. **Narcissistic personality disorders: A clinical discussion.** *Journal of the American Psychoanalytic Association*, 1974, Vol 22(2), 292-306.—Discusses 2 questions: (a) Can cases of narcissistic personality disorder be differentiated? (b) If there is a separate category of such cases, are there clear-cut narcissistic transference phenomena? Material is presented which supports the position that predominantly narcissistic disorders can be described and that it is useful to consider narcissistic transference developments. Special emphasis is placed on early magic breast-phallus fantasies and primitive sadomasochistic fantasies as indicators of specifically narcissistic pathology. The role of defective reality testing is touched on and a number of technical issues are raised. (21 ref)—*Journal summary.*

12267. Spruiell, Vann. **Theories of the treatment of narcissistic personalities.** *Journal of the American Psychoanalytic Association*, 1974, Vol 22(2), 268-278.—Presents 12 issues by which to compare and contrast the clinical approaches of Kohut, Kernberg, and their coworkers to narcissistic personalities. Alternative psychoanalytical approaches are considered, particularly in terms of the role of the Oedipus complex and the theoretical difficulties created by attempts to conceptually separate the ego from the self. (16 ref)—*Journal summary.*

12268. Wylie, Harold W. **Threads in the fabric of a narcissistic disorder.** *Journal of the American Psychoanalytic Association*, 1974, Vol 22(2), 310-328.—Describes an adult male in his 1st 4 yrs of analysis. He had been troubled throughout his life by grandiose fantasies and disturbed relationships. The meaning of these disturbances is discussed, and their connection with an early childhood relationship in which a grandiose self-image was pathologically reinforced. Early childhood trauma interfered with the normal developmental maturation of narcissism, and the grandiose self persisted without transformation into adult life. Traces of this grandiosity are viewed as threads woven into the fabric of the patient's character.—*Journal summary.*

#### Counseling & Community Mental Health & Crisis Intervention

12269. ———. **Alternatives to inpatient care: Organizing for community acceptance.** *Innovations*, 1973(Fal), Vol 1(1), 5-11.—Describes the operation of a county comprehensive mental health center and its success in treating patients in their own communities, thus eliminating the need to send them to the state mental hospital. Funds that ordinarily would be desig-

nated for the state facility were allocated instead to the county center, and the support of the local community was enlisted.

12270. ———. **Alternatives to inpatient care: Keeping it close to home.** *Innovations*, 1973(Fal), Vol 1(1), 12-16.—Describes a community effort in crisis therapy aimed at replacing inpatient care in state institutions. Therapeutic teams of psychiatrists, psychologists, social workers, nurses, occupational therapists, and psychiatric technicians work with patients in a given geographical area providing local inpatient, outpatient, and aftercare services as well as school and agency consultation and prevention services.

12271. Akeret, Robert U. **Drug abuse, community group process, and the training of natural talent.** In D. S. Milman & G. D. Goldman (Eds), *Group process today: Evaluation and perspective*. Springfield, IL: Charles C Thomas, 1974. xxii, 313 p.

12272. Berghofer, Mladen. [The approach to problems of primary prevention in psychiatry.] (Ser) *Anali Zavoda za Mentalno Zdravlje*, 1972, Vol 4(2), 21-41.—Proposes that primary prevention in the mental health field is the most acute need of modern society. It is suggested that training in preventive techniques be incorporated into the curriculum of medical workers. The development of preventive activities is linked with outpatient services, but it is felt that to be successful it must be a national policy involving various institutions and social agencies. (40 ref)—*English summary*.

12273. Dettmering, Peter. (Gesundheitsamt Charlottenburg, Abteilung Sozialpsychiatrischer Dienst, W Germany) [The role of a social psychiatric service in working with psychiatric patients: Problems of extramural psychiatry.] (Germ) *Nervenarzt*, 1973(Jan), Vol 44(1), 26-30.—Illustrates with several examples how a social-psychiatric service attempts to treat patients for as long as possible extramurally, in the community, without denying hospitalization to those who require it. Discusses role conflicts, management of borderline cases, adaptation to new social and physical environments in old patients, nature of dependency of patient on service, cooperation between service and inpatient facility, etc.—*J. Rutschmann*.

12274. Dressler, David; Donovan, James M. & Fitzgibbons, David J. (New Britain General Hosp, CT) **The development of a mental health entry service.** *Journal of Community Psychology*, 1975(Jan), Vol 3(1), 88-92.—Describes a team system approach introduced in a community mental health center and evaluates its impact on institutional operation, personnel functioning, and patient care. It is suggested that an effective entry system, the first contact a patient has with a program, is the most important part of the system as the major interface between patient and institution. This service provides a comprehensive diagnostic assessment and, when indicated, brief treatment in the form of brief psychotherapy or crisis intervention. Transfer is expedited for clients requiring longer term treatment to other programs. Both client dispositions and clinician attitudes toward the service are examined. The program has fostered increased referrals and patient-staff contacts, and clinicians have received the service favorably. The

strengths and weaknesses of the team approach are discussed.—*R. S. Albin*.

12275. Fields, Suzanne. **Unified Services: I. Getting it together.** *Innovations*, 1974(Win), Vol 1(2), 3-5.—Discusses the concept of unified service systems of mental health care in the context of the June 1973 New York State unified services bill. The approach attempts to integrate state institutions (schools and hospitals) and community mental health and retardation programs.

12276. Fields, Suzanne. **Unified Services: II. Brick and phantom hospitals.** *Innovations*, 1974(Win), Vol 1(2), 6-11.—Presents samples of new unified-services mental health programs by discussing, in interview format, the New York facilities at Creedmore State Hospital, Queens, and South Beach Psychiatric Center, Staten Island. Problems of community participation and reaction to the unified services approach are discussed. New unified services programs were developed, such as employing elderly blind people to work with older, chronic patients; voter registration drives; staff BA and MA degree programs; and day-care facilities for children of staff and community members.—*J. Carlson*.

12277. Giamartino, Gary A. (Western Kentucky U) **Electroconvulsive therapy and the illusion of treatment.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1127-1131.—Discusses the moral and ethical considerations surrounding the practice of electroconvulsive therapy. It is pointed out that most research has been devoted to noting this treatment's efficacy, but conclusive empirical evidence in favor of it does not, as such, exist. The argument that psychiatrists use electroconvulsive therapy solely to prevent harm to the patient is examined and rejected. The illusion of treatment implies that psychiatrists may have ulterior motives in turning to this mode of therapy. If these ulterior motives influence a psychiatrist's choice of treatment, the treatment may be considered morally wrong.—*Journal abstract*.

12278. Gordon, James S. (NIMH, Ctr for Studies of Child & Family Mental Health, Rockville, MD) **The Washington, D.C. runaway house.** *Journal of Community Psychology*, 1975(Jan), Vol 3(1), 68-80.—Describes the program and presents case histories in a home in which runaway children can "cool off" and "get their heads together" upon their return to the community. The poor treatment accorded them by their parents prior to the event is interpreted in a framework of societal attitudes toward children.

12279. Halpern, Joseph & Binner, Paul R. (U Denver) **A model for an output value analysis of mental health programs.** *Administration in Mental Health*, 1972(Win), 40-51.—Presents a simple model using the economic value of the patient and the value of patient improvement to estimate program output as related to program costs, resulting in estimates of the rate of return and the degree of effectiveness.

12280. Harris, Sandra L. (Rutgers State U, Douglass Coll, New Brunswick) **Involving college students and parents in a child care setting: A day school for the child with autistic behaviors.** *Child Care Quarterly*, 1974(Fal), Vol 3(3), 188-194.—Describes a day treatment program for children with severely deviant behavior. Operant techniques were employed to increase deficient language and social behaviors in 7 boys and 3

girls 5-12 yrs old. Preliminary results indicate improvement in all children except one. The program employed 60 undergraduates as individual tutors and required regular parent participation in behavior modification workshops. Child care workers may play an important role in training parents to work with their own children, supervising the training of college students, and utilizing such students effectively in the care of deviant children.

—J. H. Feldstein.

12281. Hefez, A. (Rambam Hosp, Haifa, Israel) **The psychiatric work village in Israel: The Mazra experiment in rehabilitation.** *Israel Annals of Psychiatry & Related Disciplines*, 1974(Sep), Vol 12(3), 194-202.—Previous authors have questioned the concept of the work village as a lifetime residence for chronic deteriorated psychotics in light of the "community movement" in psychiatry. The present article outlines the organization and therapeutic principles underlying the functioning of the Mazra village settlement in Israel. The frustration arising from the long-term management of such patients led the responsible staff to reconsider the issues and try new means for rehabilitation. A survey of the 277 residing patients was carried out in 1959 to evaluate their rehabilitation potential. However, with the change in hospital policy, the village was transformed in 1963 into an all-purpose psychiatric hospital. 10 yrs later, an outcome study was made by the author in order to follow the fate of the original work village population. Results clearly point out that the majority of these patients needed further hospitalization. This strongly supports the ideology that led to the creation of psychiatric village-settlements.—*Journal abstract.*

12282. Hunter, R. C. (U Toronto, Ontario, Canada) **Notes on five years of office consultations in psychiatry.** *Canadian Psychiatric Association Journal*, 1974(Jun), Vol 19(3), 297-303.—Gives statistical data on 169 patients referred for psychiatric consultation in the years 1968-1972. These data are compared with health clinic statistics for Ontario. Some factors involved in managing a consulting practice are considered. (French summary) —*Journal abstract.*

12283. Kaplan, Seymour R. (Albert Einstein Coll of Medicine, Yeshiva U) **Characteristic phases of development in organizations.** In D. S. Milman & G. D. Goldman (Eds), *Group process today: Evaluation and perspective*. Springfield, IL: Charles C Thomas, 1974. xxii, 313 p.

12284. Krieger, Howard et al. (American U, Counseling Ctr) **The American University "hotline": A model crisis intervention telephone service.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 193-194.

12285. Kuhn, Roy. (U Wisconsin, Milwaukee) **Implications of Seidl's paper for child care practice.** *Child Care Quarterly*, 1974(Fal), Vol 3(3), 164-165.—Discusses possible improvements in child care based on the use of community-oriented residential institutions. These would require the employment of more able staff, trained to assist in community problems. Attempts to substitute foster and group homes for institutional care are described and are attributed to economic motives.—J. H. Feldstein.

12286. La Rocco, J. M.; Biersner, R. J. & Ryman, D. H. (US Navy Medical Neuropsychiatric Research Unit,

San Diego, CA) **Mood effects of large group counseling among Navy recruits.** *Journal of Counseling Psychology*, 1975(Mar), Vol 22(2), 127-131.—Investigated the effects of a group counseling program introduced into the US Navy basic military training curriculum. A modified version of the Mood Adjective Checklist consisting of 40 items was administered to 1,196 male Navy recruits at 4 different times during basic training. 5 stable mood factors—anger, activity, depression, fatigue, and pleasure—were found. With the exception of anger, negative moods declined and positive moods increased over the course of training for both control and experimental groups. The experimental group, however, consisting of recruits who had received group counseling sessions, reported significantly less anger and significantly more pleasure than the control group. It is concluded that counseling of large groups of men can significantly reduce feelings of anger and enhance feelings of pleasure among Navy recruits.—*Journal abstract.*

12287. Leonard, Charles L. (Appalachian Mental Health Ctr, Detoxification Unit, Elkins, WV) **The role of the community hospital in treatment of the alcoholic patient.** In *Selected papers delivered at The Ninth Annual West Virginia School on Alcohol and Drug Abuse Studies*, June 17-22, 1973. Morgantown, WV: West Virginia University, 1973. 165 p.

12288. Mikesell, Richard H. & Barry, John R. (U Georgia) **Community psychology consultation in planning social change programs.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 111.

12289. Milčinski, Lev. [Tertiary prevention in outpatient mental health care.] (Srcr) *Anali Zavoda za Mentalno Zdravlje*, 1972, Vol 4(2), 59-68.—Defines tertiary prevention as the effort to decrease residual disorders following mental illness. The activity should begin while the patient is still in treatment and should include elements and persons in his social environment. It is addressed to those iatrogenic and social agents that act to distort the patient's personality and prevent his return to active social life. The basic methods used are sociotherapy and community therapy. A survey of institutions practicing tertiary prevention is given and the roles of psychiatrists and other mental health workers are discussed. (English summary)—*English summary.*

12290. Petrović, Dušan. [Secondary prevention in outpatient mental health care.] (Srcr) *Anali Zavoda za Mentalno Zdravlje*, 1972, Vol 4(2), 43-58.—Discusses prevention of mental illness on the community level. Early diagnosis is considered most important. The patient must be willing to undergo examination and adequate services must be available. Secondary prevention also involves wide use of various screening methods and early treatment of newly detected cases. Applications of these principles to all age groups are discussed.—*English summary.*

12291. Richter, Horst-Eberhard. (Psychosomatische Universitätsklinik, Giessen, W Germany) [Community development and psychotherapy in ghettos.] (Germ) *Psychotherapy & Psychosomatics*, 1974, Vol 24(4-6), 269-280.—Examines the higher incidence of psychological disorders among ghetto inhabitants compared to middle class persons in terms of several socioeconomic factors. The causes among lowest class persons include

lack of access to psychotherapy facilities, mistrust of revealing one's problems, a childhood learned reliance on pragmatic work, and an aversion to introspection as a means of solving inner stresses. An innovative project of team action in ghettos is described in which student action groups and psychotherapists unified efforts to provide services to 120 selected ghetto families and their 400 children. Proposed tasks for the groups included crisis counseling and youth counseling. Questions are posed about what contribution the normally non-interfering psychotherapist can make in this new role of active participation in therapy. (English abstract) (24 ref)—R. Tomasko.

12292. Saper, Bernard. (Florida International U, Miami) **Right, liberty and the pursuit of mental health.** *Journal of Community Psychology*, 1975(Jan), Vol 3(1), 3-14.—Describes the impending collision of 3 trends: (a) the momentum of the patients' rights movement, (b) the emergence of behavior modification as a cardinal therapeutic modality, and (c) the impetus to convert old fashioned state hospitals into truly responsive and effective residential treatment facilities. Problems inherent in the court system in defining and protecting individual rights include the use of expert testimony and improper intrusiveness. It is asserted that mental illness is a misnomer and that persons so categorized should really be permitted a more neutral and less damning label. 3 targets of legal concern are outlined: (a) the underlying principles of social learning, the complex systems and laws of operant and respondent condition, and the scientific-professional foundation of behavior change; (b) the technologies that presumably derive from these underlying principles of behavior—behavior therapy, behavior modification, contingency management, token economy, desensitization, etc; and (c) the organizational, bureaucratic, and administrative considerations which drastically qualify the effectiveness of treatment. The use of a treatment contract is suggested. (34 ref)—R. S. Albin.

12293. Schaefer, Jacqueline W.; Palkes, Helen S. & Stewart, Mark A. (St Louis Children's Hosp, MO) **Group counseling for parents of hyperactive children.** *Child Psychiatry & Human Development*, 1974(Win), Vol 5(2), 89-94.—Describes a procedure in which parents of hyperactive children (3-12 yrs old) learned how to make and enforce rules, and how to influence their children's behavior by using the principles of learning theory. 9 couples met weekly for 10 sessions of group counseling and discussion. This procedure is proposed as an effective alternative or adjunct to drug treatment when specific advice and support are also given to the children's teachers.—E. S. Goodman.

12294. Scher, Murray. (Tusculum Coll) **Verbal activity, sex, counselor experience, and success in counseling.** *Journal of Counseling Psychology*, 1975(Mar), Vol 22(2), 97-101.—Examined the contribution made by client and counselor verbal activity, client and counselor sex, and counselor experience to satisfaction and symptom relief. Ss were 18 male and 5 female counselors employed at a university counseling service (9 of whom were experienced), 34 undergraduates, and 2 graduate students. 20 of the students were female and 16 were male. Counselor-offered facilitative conditions were held

constant. Data were analyzed using a multiple regression analysis. Clients seeing experienced counselors reported better outcomes. Neither sex nor activity of the therapeutic participants contributed to therapeutic success. Explanations of findings and implications for counseling practice are discussed. (16 ref)—*Journal abstract*.

12295. Seidl, Fredrick W. (U Wisconsin, Madison) **Community oriented residential care: The state of the art.** *Child Care Quarterly*, 1974(Fal), Vol 3(3), 150-163.—Discusses how child care institutions can be community oriented. Criteria of community-oriented care are (a) community participation in planning, (b) utilization of community services, (c) preparation of children for community living, and (d) participation of residents in community activities. Evidence indicating a positive relationship between family contact, adjustment, and learning ability is cited. Programs employing family members, foster grandparents, and home visits with community members are discussed, and also the difficulties of liaison with local schools. European children's villages are described as models of family-style living. In addition, institutional personnel may provide community services. (34 ref)—J. H. Feldstein.

12296. Silver, Maurice J.; St Clair, Catherine H. & Siegel, Jerome M. (Hahnemann Community Mental Health/Mental Retardation Ctr, Philadelphia, PA) **Parental satisfaction at follow-up of child outpatients from an urban mental health center.** *Journal of Community Psychology*, 1975(Jan), Vol 3(1), 36-39.—Conducted a follow-up study of parents of 105 child outpatients from 4 clinics of an urban community mental health center. Parent contacts were made several months after discharge regarding perceptions of the center and satisfaction with the help received. The nature of treatment had been eclectic with a multidisciplinary team approach offered by psychiatrists, psychologists, social workers, and paraprofessionals. Problems parents reported frequently as causing the child to be brought to the center were school behavior (23%), learning difficulty (20%), defiance with adults (15%), unethical behavior (11%), truancy (11%), anxiety (11%), aggressiveness (9%), shyness (8%), depression or suicide attempts (6%), bizarreness (6%), and a scattering of other problems. Satisfaction was high with courtesy and help received, regardless of clinic populations' differing demographic characteristics. 70% reported the child's major problem improved, 30% "greatly improved," and about 90% would return to the center and recommend it to others.—R. S. Albin.

12297. Silverman, Jerome S. (New York Council of Child Psychiatry, Committee on Clinics, New York) **The child/adolescent and urban psychiatric clinics: Summary of a survey of mental health clinic care for children in New York City.** New York, NY: Health Sciences Publishing, 1974. 181 p. \$7.95.—Presents the results of a study of the organization, administration, and clinical practices in 85 children's mental health facilities in New York City. Specific aspects of the services discussed include intake and diagnostic procedures, staffing and staff training, clinic schedules, eligibility requirements, treatment programs for parents, and the roles of the psychiatrist, social worker, and psychologist.

12298. **Speer, David C. & Schultz, Mark.** (Crisis Service of Erie Cty. Buffalo, NY) **An instrument for assessing caller-reported benefits of calls to a telephone crisis center.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 102.—Briefly reports 3 studies to obtain evaluative data from hotline users using a 14-item, 4-scale (communication of understanding by counselor, "goodness" of call, caller's emotional state since call, and surveying of alternatives, planning, and action) rating measure. Validity and reliability data suggest that the measure has a promising potential for assessing telephone counseling effectiveness.

12299. **Speer, David C.** (Erie County Suicide Prevention & Crisis Service, Buffalo, NY) **The role of the crisis-intervention model in the rehabilitation of criminal offenders.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 133.

12300. **Sundin, Bertil.** (U Stockholm, Sweden) **[Primary intervention and mental health.]** (Swed) *Psykisk Hälsa*, 1972, Vol 13(2), 87-96.—Describes common shortcomings of mental health programs, including the culture-bound values of mental health concepts and the use of deviant and high-risk labels. The community is recommended as the unit of analysis, with the individual identified within communal settings. The psychologist's role in community work is discussed in terms of professional identity, consultation or administration, and loyalty conflicts. Primary intervention should consider the importance of separating professional and personal roles, of recognizing that the individual and community do not stand in a mechanical relationship, and of initiating social action.—*R. J. Simeonssen.*

12301. **Tischler, Gary L.; Henisz, Jerzy; Myers, Jerome K. & Garrison, Vivian.** (Yale U, Medical School) **The impact of catchmenting.** *Administration in Mental Health*, 1972(Win), 22-29.—Compared a catchment community mental health center (CMHC) with a noncatchment multiservice treatment facility, both in New Haven, Connecticut. Overall admissions showed a significantly greater representation of disadvantaged groups in the CMHC patient population. When the noncatchment service area was sociodemographically matched to the CMHC service area, the differences between the 2 patient populations disappeared, but the CMHC had a greater number of patients. It is concluded that catchmenting per se was effective at correcting sociodemographic biases in treatment populations. When the proportions of illness categories are compared in the 2 populations, catchmenting was ineffective in correcting for imbalances in services to categorical populations.—*R. J. Albers.*

12302. **West Virginia Dept of Mental Health, Div on Alcoholism & Drug Abuse.** (Charleston) **The concept of Alcoholics Anonymous in a treatment setting.** In *Selected papers delivered at The Ninth Annual West Virginia School on Alcohol and Drug Abuse Studies, June 17-22, 1973.* Morgantown, WV: West Virginia University, 1973, 165 p.

12303. **Winter, Metta L. & Peters, Donald L.** **Day care is a human system.** *Child Care Quarterly*, 1974(Fal), Vol 3(3), 166-176.—Discusses characteristics of staff, parents, and children in day care centers, and the centers' effects on these groups. Children are described in terms

of age, socioeconomic, and family characteristics, and parents' ages, income, education, occupations, and attitudes are discussed. Parents are basically concerned with education while program directors emphasize goals such as self-reliance and cooperation. Parents and staff also tend to disagree about opportunities for parent participation. Day care centers appear beneficial in terms of family income, professional opportunities for women, and marital satisfaction.—*J. H. Feldstein.*

12304. **Wodarski, John S.; Rubelz, Ghassan M. & Feldman, Ronald A.** (U Tennessee, School of Social Work) **Program planning for antisocial boys.** *Social Work*, 1974(Nov), Vol 19(6), 705-713.—Evaluated the extent to which program planning affects the behavior of antisocial children, with 8-16 yr old anti- and prosocial boys as Ss. 8 categories of activities were measured—verbal activity, "it" games, team sports, free swimming, arts and crafts, special events, transitional activity, and written tasks. Those activities that tended to decrease antisocial and nonsocial behavior and those that tended to increase the incidence of prosocial behavior are described. Results show that program planning is a pertinent variable in controlling the behavior of antisocial children.—*Journal abstract.*

### Physical Treatment

12305. **Damásio, António R.; Lima, Almeida & Damásio, Hanna.** (Ctr de Estudos Egas Moniz Hosp de Santa Maria, Lisbon, Portugal) **Nervous function after right hemispherectomy.** *Neurology*, 1975(Jan), Vol 25(1), 89-93.—A hemispherectomy was performed on a 20-yr-old female because of progressively uncontrollable seizures and behavioral changes resulting from major head trauma at the age of 5 yrs. Psychomotor development up to this age had been normal. Examination 14 yrs after the hemispherectomy shows that she had little impairment in higher nervous function depending on the ablated hemisphere. Left-sided motor performance improved and sensory deficit was scant. There was no hemianopia and the right-eye visual field was enlarged. Dichotic listening showed left-ear preference and no lesion effect. Findings suggest that significant and positive adaptation may occur in mature brain. (25 ref) —*Journal abstract.*

12306. **Goldstein, Marvin N.; Joynt, Robert J. & Hartley, Ronald B.** (Monroe Community Hosp, Rochester, NY) **The long-term effects of callosal sectioning: Report of a second case.** *Archives of Neurology*, 1975(Jan), Vol 32(1), 52-53.—Cites a case previously reported by M. N. Goldstein and R. J. Joynt (see PA, Vol 43:10127) and presents the case of a male who had the corpus callosum sectioned at 7 yrs of age. Testing him 32 yrs later revealed defects in transfer of learning and crossed (mixed-modality) matching. This points out that defects may persist long after such surgery and that early reports of negative results of callosal section in patients were probably not correct.—*Journal abstract.*

12307. **Hore, B. D.; Nicolle, F. V. & Calman, J. S.** (University Hosp of South Manchester, England) **Male transsexualism in England: Sixteen cases with surgical intervention.** *Archives of Sexual Behavior*, 1975(Jan), Vol 4(1), 81-88.—Presents a detailed clinical description of 16 male transsexuals seeking sex reassignment surgery.

Practically all patients had been aware of incorrect sex assignment during childhood and had cross-dressed in either childhood or adolescence. The majority were exclusively homosexual. 68% were regarded as socially stable, but 50% had suffered some form of psychiatric illness. Only 1 patient had not assumed a female role when seen. All patients had expectations of surgical reassignment. Techniques of the operation are outlined, and follow-up evaluation of 16 patients are reported which indicate that 11 have benefited both objectively and subjectively from the reassignment.—*Journal summary.*

12308. Höweler, M.; de Munnik, D. & Boertien, A. H. (Free U, Amsterdam, Netherlands) **The effects of mild electrostimulation on migraine and tension headache.** *International Mental Health Research Newsletter*, 1973(Win), Vol 15(4), 11-13.—Studied the effectiveness of electrostimulation (ES) in decreasing chronic migraine headache symptoms, based on a review of the causes of and treatment for headache symptoms and the association between ES and relaxation in earlier studies. 11 Ss selected as chronic migraine patients each received 20 treatments of mild ES of 1 hr duration using the apparatus Electroderm I. Ss received no additional therapy during the treatment period except for medication, and measurements were made during 3-wk periods pre- and posttreatment. The probable confounding effects of medication prevented statistical analysis. Results show strong improvement in 27% of the Ss, slight improvement in 27%, and no improvement in 46%. It is concluded that ES may be helpful in combination with behavioral and environmental therapy for migraine symptoms, and with insight therapy for predominantly tension headache symptoms. An advantage of ES is that non- or paraprofessionals can administer it. (26 ref)—*Journal summary.*

12309. Kalucy, R. S. & Crisp, A. H. (St George's Hosp Medical School, London, England) **Some psychological and social implications of massive obesity: A study of some psychosocial accompaniments of major fat loss occurring without dietary restriction in massively obese patients.** *Journal of Psychosomatic Research*, 1974(Dec), Vol 18(6), 465-473.—Treated 20 massively obese patients by ileo-jejunal bypass surgery. 18 were studied postoperatively through personal interviews, questionnaires (concerning degree of satisfaction with outcome of the operation and family attitudes), and the Middlesex Hospital Questionnaire. Almost all Ss went through "low" periods in the 1st 12 mo, and this was most marked in the 1st 6 mo after the operation. There was, overall, a change in affect from one of shame to one of more mature and positive interdependence. In general, the 2-yr outcome, both physical and psychological, is good even for patients with psychoneurotic disorders. (32 ref)—*W. G. Shipman.*

12310. Rogers, Malcolm P. & Kelly, Martin J. (US Public Health Service Indian Hosp, Rosebud, SD) **General hospital consultation.** *Psychiatric Opinion*, 1974(Feb), Vol 11(1), 36-42.—Describes a psychiatric consultation with a 36-yr-old male patient who had undergone kidney transplant. The significance of the time and circumstances of the consultation is pointed out. The patient's problems and difficulties in deciding

to have the operation, especially in discussing it with his wife and doctors, are detailed. The fundamental psychic meaning of hospitalization for the patient is presented. The great need for empathy with the patient in psychiatric consultations is emphasized.—*R. S. Albin.*

12311. Ruff, Carol F. & Templer, Donald I. (Western State Hosp, Hopkinsville, KY) **Psychoticism of schizophrenics who received many electroconvulsive treatments.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 132.

12312. Squire, Larry R. & Miller, Patricia L. (U California, San Diego) **Diminution of anterograde amnesia following electroconvulsive therapy.** *British Journal of Psychiatry*, 1974(Nov), Vol 125, 490-495.—24 psychiatric patients receiving a series of bilateral electroconvulsive therapy (ECT) for relief of depressive illness were given learning tests after each of their 1st 4 ECT treatments. Learning sessions took place 20, 50, and 180 min after each treatment, and different material was learned at each session. Results indicate that (a) the ability to retain newly learned material was initially impaired and then improved during the hours after each ECT treatment, (b) the ability to retain material for a 30-min interval was impaired to about the same extent and improved at about the same rate after each of the 1st 4 ECT treatments, and (c) the ability to retain material for a 24-hr interval was significantly poorer and improved more slowly after the 4th ECT treatment than after the 1st ECT treatment. Findings are consistent with the hypothesis that forgetting of material learned after ECT is abnormally rapid because the ability to store information is impaired. Results also demonstrate the usefulness of long-delay retention tests for assessment of ECT-produced memory impairment. (20 ref)—*Journal summary.*

12313. Westman, Jack C. & Zarwell, David H. (U Wisconsin, Madison) **Traumatic phallic amputation during infancy.** *Archives of Sexual Behavior*, 1975(Jan), Vol 4(1), 53-63.—Reports an unusual case of phallic amputation to illustrate the complex issues involved in considering transsexual surgery during early life. The lack of ambiguity regarding this patient's physiological gender at the age of 15 mo permitted his management to rest solely on the long-range social and developmental implications of his phallic defect. The impact of this event on the child's family, on the community, and on professional workers was profound, leading to a series of circumstances that affected objectivity and the decision-making process. The decision to retain the male gender was based on the uncertain long-range effects of the loss of capacity for procreation and the surgical procedures and hormone therapy necessitated by gender change. (17 ref)—*Journal abstract.*

#### Social Casework & Rehabilitation

12314. Barklind, Kenneth. (Wisconsin State U, River Falls) **Modeling in prevocational training.** In J. G. Cull & R. E. Hardy (Eds), *Behavior modification in rehabilitation settings: Applied principles*. Springfield, IL: Charles C Thomas, 1974. xvii, 251 p.

12315. Bennett, Lawrence A. **Self-esteem and parole adjustment.** *Criminology: An Interdisciplinary Journal*, 1974(Nov), Vol 12(3), 346-360.—Examined the relation-

ship between self-esteem of prison inmates just prior to their release and their postinstitutional adjustment at 6-mo, 1-yr, and 2-yr follow-ups. Ss were a total of 142 male felons with a median age of 38 yrs and a median time served of 2 yrs, 9 mo. Results show a small but statistically significant positive correlation ( $p < .01$ ) between prerelease self-esteem and parole adjustment, supporting the hypothesis. Because of the low correlation, however, other areas of study are suggested. (21 ref) —*Journal abstract.*

12316. Bowman, James T.; Cook, Sherry D. & Whitehead, Garry. (Mississippi State U) **Pre-release training of female public offenders.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1193-1194.—Assessed the effect of prerelease training on the personalities of 16 incarcerated females and 8 controls. Ss' pre- and posttraining scores on the 16 Personality Factor Questionnaire show significant differences between groups on 7 factors.

12317. Broekema, Marilyn C.; Danz, Kathleen H. & Schloemer, Carleen U. (U Wisconsin, Madison) **Occupational therapy in a community aftercare program.** *American Journal of Occupational Therapy*, 1975(Jan), Vol 29(1), 22-27.—Describes an aftercare program for psychiatric patients aimed at facilitating their adequate and independent adjustment to the community. The development of the program's behavioral rehearsal model is outlined, and the function of the occupational therapist as a case manager of the treatment team is discussed.

12318. Dallas, Don. (Memorial Hosp of DuPage County, Elmhurst, IL) **The forgotten remnant: The elderly in need.** *Social Work*, 1974(Nov), Vol 19(6), 733-736.—Discusses the need for protective services for elderly sick persons with no cooperative relatives or friends. 2 case examples point up the need for geriatric foster homes or some like service other than state or local mental hospitals which often are unsuited to the person's needs.

12319. DeMars, Patricia K. (St Catherine Coll, St Paul, MN) **Training adult retardates for private enterprise.** *American Journal of Occupational Therapy*, 1975(Jan), Vol 29(1), 39-42.—Describes a community-based program for placing low-level retardates with no prior work experience or job training into work positions in private business and industry compatible with their needs and abilities. The various problems and solutions encountered in the attempt to match the needs of employers, who experienced rapid turnover and motivation problems of employees in routine work tasks, with the needs of low-level, nonworking, adult retardates who showed potential for these types of jobs are analyzed. —*Journal abstract.*

12320. Ganzer, Victor J. (Child Study & Treatment Ctr, Fort Steilacoom, WA) **The use of modeling techniques in rehabilitation of the juvenile offender.** In J. G. Cull & R. E. Hardy (Eds), *Behavior modification in rehabilitation settings: Applied principles*. Springfield, IL: Charles C Thomas, 1974. xvii, 251 p.

12321. Hardy, Richard E. & Cull, John G. (Virginia Commonwealth U) **Developing psychological services in vocational rehabilitation work.** In J. G. Cull & R. E. Hardy (Eds), *Behavior modification in rehabilitation*

*settings: Applied principles*. Springfield, IL: Charles C Thomas, 1974. xvii, 251 p.

12322. Hartlage, Lawrence C. (Medical Coll of Georgia, Augusta) **Peer group influence in behavior modification of the mentally retarded.** In J. G. Cull & R. E. Hardy (Eds), *Behavior modification in rehabilitation settings: Applied principles*. Springfield, IL: Charles C Thomas, 1974. xvii, 251 p.

12323. Hoxworth, David H. (Iroquois Mental Health Ctr, IL) **A case presentation of the treatment of dyspareunia.** *Clinical Social Work Journal*, 1973, Vol 1(Special Issue), 251-256.—Describes in some detail the treatment of a young married woman suffering from dyspareunia. The need for social workers to become more involved in discussing and working with sexual problems is emphasized.

12324. Mahoney, Kathryn & Mahoney, Michael J. (Pennsylvania State U) **Psychoanalytic guidelines for child placement.** *Social Work*, 1974(Nov), Vol 19(6), 688-696.—Contends that psychoanalytic theory is not sufficient for establishing guidelines for child placement. The issues of continuity and multiple parenting are tested against available empirical evidence. It is suggested that legal recommendations drawn from psychoanalytic theory may warrant re-evaluation, and that the best interests of the child are not deducible from theory. (35 ref)—*Journal abstract.*

12325. McEwen, J. C. (South Australian Inst of Technology, Adelaide) **Working conditions with different types of disability.** In A. T. Welford (Ed), *Man under stress*. New York, NY: John Wiley & Sons, 1974. 140 p. \$10.95.—Reports that the distribution of mental retardates in various work areas of a large rehabilitation workshop was significantly different from that of psychiatric patients. Retardates tended to be found in jobs where noise levels and demands for speed, exactness, and team work were relatively high, and psychiatric cases in jobs where all these demands were lower. A model relating performance to arousal level and the ability to withstand stress is presented to account for the results. (French & German summaries)

12326. Phelps, William R. (West Virginia Div of Vocational Rehabilitation, Charleston) **Coordination of vocational rehabilitation and department of welfare activities.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 133-134.

12327. Phelps, William R. (West Virginia Div of Vocational Rehabilitation, Charleston) **A project for the expansion of vocational rehabilitation services in rural hospitals in cooperation with the welfare medical assistant program.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 134.

12328. White, Mary E. (Metropolitan Toronto Assn for the Mentally Retarded, Adult Support Services, Ontario, Canada) **Children's games for the adult mentally retarded.** *Journal of Leisureability*, 1974(Apr), Vol 1(2), 4-7.—Suggests that leisure programs for retarded adults are often overorganized, emphasizing childlike behaviors and activities. It is recommended that such programs encourage independence and teach normal adult social skills to retarded adults.

### Hospital Programs & Hospitalization & Institutionalization

12329. Balch, Philip & Balch, Koreen. (U Arizona) A racial comparison of admissions, diagnoses, and releases of patients in a state mental hospital system: A five year review. *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 197.

12330. Boenheim, Curt. (Columbus State Hosp, OH) Psychoanalysis and activities therapy. *American Journal of Art Therapy*, 1974(Jul), Vol 13(4), 293-302.—Presents a case study to demonstrate the utility of an activities therapy program in treating hospitalized patients. Focus is on the interrelations of all parts of the therapy programs.

12331. Coe, William C. (California State U, School of Natural Sciences, Fresno) Token economies: A description. In J. G. Cull & R. E. Hardy (Eds), *Behavior modification in rehabilitation settings: Applied principles*. Springfield, IL: Charles C Thomas, 1974. xvii, 251 p.

12332. Collins, Malcolm J. & Rodman, Doris H. (Massachusetts Dept of Mental Health, Region IV, Wakefield) A residential program for the developmentally disabled. *Social Work*, 1974(Nov), Vol 19(6), 724-726.—Describes a network of 5 community residences for the developmentally disabled established by a state institution in cooperation with nonprofit organizations. Advantages of the public-private partnership are detailed.

12333. Cooklin, A. I. (North East Metropolitan Regional Hosp Board, London, England) Exploration of the staff-patient "contract" in an acute female admission ward. *British Journal of Medical Psychology*, 1974(Dec), Vol 47(4), 321-335.—Describes the development of a "contract" program in which 116 psychiatric patients on an acute female admissions ward were assisted in defining individual treatment programs. Results indicate that the program was successful in (a) establishing a meeting place between patient and staff at all levels which held real and shared responsibility; (b) increasing recognition of the "adult," "healthy" part of the patient; (c) redefining the function of inpatient treatment, particularly for crisis admissions; (d) increasing staff confidence and participation by both staff and patients; (e) easing ward management; (f) increasing the admission rate to the ward by 33%; and (g) encouraging the widespread use of contract conferences.—*M. E. Pounsel*.

12334. Corder, Michael P.; Kiehle, Jane; Ledbetter, Doris & Flannery, Eugene P. (Latterman Army Medical Ctr, Presidio of San Francisco, CA) Cancer patient care in a general hospital. *Military Medicine*, 1975(Jan), Vol 140(1), 44-46.—Describes the objectives, personnel, inpatient and outpatient care services, clinical organization and functions, research, psychological support services, and record-keeping procedures in a medical cancer care program in a general hospital. The use of discussion groups and individual counseling with the cancer patients is noted.

12335. Cross, K. W. & Turner, R. D. (U Birmingham, England) Patient visiting and the siting of hospitals in rural areas. *British Journal of Preventive & Social Medicine*, 1974(Nov), Vol 28(4), 276-280.—For 1 wk all visitors to patients in geriatric, psychiatric, and subnor-

mal hospitals were asked to give details of their journey to hospital, including the addresses from which they set out in order to examine (a) the effect of distance of the patient's home from hospital upon the frequency of visiting, and (b) the likely consequences of adopting a policy of concentration of all resources at 2 district general hospitals. Whereas greater distances between home and hospital (up to 20 miles) resulted in little reduction in the frequency of visiting of short-stay (less than 6 mo) geriatric patients and of both short- and long-stay psychiatric patients, they resulted in much less frequent visiting of long-stay geriatric patients. The large majority of subnormality patients were in hospitals outside the county. It is concluded that in the predominantly rural area, the provision of all hospital services at 2 district general hospital sites would greatly reduce distances traveled by visitors to psychiatric patients and to subnormal patients, and would increase distances to geriatric patients. It is suggested that there is a case for siting long-stay (over 6 mo) geriatric patients in units near their homes, and possibly also psychiatric and subnormal patients if their homes are at inconvenient distances from the district general hospital.—*Journal abstract*.

12336. Dorrucchi, Fernanda. (Montefiore Home, Cleveland, OH) Classes for adult children of the aged. *Social Work*, 1974(Nov), Vol 19(6), 732-733.—Describes a program designed to help adult children prepare for the institutionalization of aged parents. Group sessions held with institution staff were found to be effective in helping those beset with anxiety, guilt, and indecision.

12337. Friesen, Deloss D. (U Nebraska, Lincoln) The use of behavior modification techniques with the mentally ill. In J. G. Cull & R. E. Hardy (Eds), *Behavior modification in rehabilitation settings: Applied principles*. Springfield, IL: Charles C Thomas, 1974. xvii, 251 p.

12338. Gelman, Sheldon R. (Pennsylvania State U) Periodic review of mentally retarded residents. *Social Work*, 1974(Nov), Vol 19(6), 726-729.—Presents findings of a study investigating the implementation of legislation requiring the periodic evaluation of mentally retarded patients in state facilities. Reasons for an insufficient number of patients being moved into the community are given.

12339. Hoffmann, Helmut. (Willmar State Hosp, MN) County characteristics and admission to state hospital for treatment of alcoholism and psychiatric disorders. *Psychological Reports*, 1974(Dec), Vol 35(3), 1275-1277.—Studied 1,270 male and 112 female alcoholic and 350 male and 447 female psychiatric admissions to a state hospital in 1971 and 1972 to determine the correlations between the utilization rate of alcohol and psychiatric treatment in a state hospital and characteristics of 20 rural counties. Alcoholics were affected by more characteristics than were psychiatric patients. Unemployment appeared more important than poverty. The distance to the hospital was negatively related to utilization of the hospital for males but not for females.—*Journal abstract*.

12340. Holroyd, Jean; Brown, Nancy; Wikler, Lynn & Simmons, James Q. (U California, Neuropsychiatric Inst, Los Angeles) Stress in families of institutionalized and noninstitutionalized autistic children. *Journal of Community Psychology*, 1975(Jan), Vol 3(1), 26-31.—Ex-

plored the relationships between parents' reports of personal and family problems (viewed as stress indicators) in their attempts to deal with an autistic child. 2 variables were examined: institutionalization and the age of the child. Parents in 29 families with autistic children (28 mothers and 22 fathers) were interviewed and completed a questionnaire as part of a larger follow-up study. Children ranged in age from 1 to 18, with 1 aged 24. 78% were male and all but one were Caucasian. The families were evaluated for level of stress by combining parent interview responses. No differences were found between families of institutionalized and noninstitutionalized children. There was some suggestion, however, that among children kept at home, stress ratings were higher for families of older children than of younger children.—*R. S. Albin.*

12341. Katz, Roger C. & Woolley, F. Ross. (U of the Pacific) **Criteria for releasing patients from psychiatric hospitals.** *Hospital & Community Psychiatry*, 1975(Jan), Vol 26(1), 33-36.—Conducted a pilot study to determine the kinds of criteria being used by mental health professionals in discharging patients from mental hospitals. 21 criteria were identified in the first phase of the study, and 43 staff members later rated the items according to their perceived importance. Although there was general agreement on most of the items, reliable differences of opinion were expressed in some instances. The differences were attributed less to the respondents' professional discipline than to their hospital affiliation—Veterans Administration (VA) or non-VA. The need for developing a standardized list of discharge criteria is emphasized, and uses for such criteria are discussed.—*Journal abstract.*

12342. Kennedy, Donald et al. (Rideau Correctional Ctr, Burritts Rapids, Ontario, Canada) **Crisis intervention in a correctional centre.** *Journal of Community Psychology*, 1975(Jan), Vol 3(1), 93-94.—Describes an approach to the treatment of inmate crises in correctional institutions. Alternatives to medication are suggested. A relaxation and self-control technique is described which has been used with about 200 inmates for approximately 6 mo. 70% of the crises were alleviated with this method. Additional benefits of the treatment include the encouragement of medicine and psychology to develop other liaisons, the increased acceptance of the professional staff by corrections personnel, and the placement of this training within the context of a life-skills course. The procedure is economical in that it can be administered by other than psychological staff.—*R. S. Albin.*

12343. Kirstein, Larry; Weissman, Myrna M. & Prusoff, Brigitte. (Yale U, Medical School) **Utilization review and suicide attempts: Exploring discrepancies between experts' criteria and clinical practice.** *Journal of Nervous & Mental Disease*, 1975(Jan), Vol 160(1), 49-56.—Studied the discrepancies between experts' criteria for hospitalization of suicide attempters ( $N = 248$ ) and actual clinical practice to develop utilization review criteria which reflect current clinical thinking and which could form guidelines for the assessment of clinical care. Experts' criteria predicted that a hospitalized group of suicide attempters did not require hospitalization and that a nonhospitalized group

of suicide attempters required hospitalization. Examination of the discrepancies between clinical practice and experts' criteria not only revealed that incorporation of clinical measures of depressive symptomatology (e.g., Hamilton Rating Scale for Depression) could improve the experts' criteria for hospitalization but also showed that clinicians did not hospitalize a group of markedly symptomatic and socially impaired white suicide attempters. (27 ref)—*Journal abstract.*

12344. Levenson, Herbert S. & Balson, Paul M. (McAuley Neuropsychiatric Inst, Child Psychiatry Service, San Francisco, CA) **Behavioral and milieu management of acute psychiatric inpatients.** *Military Medicine*, 1975(Jan), Vol 140(1), 36-38.—Reports the developmental and operational aspects of a treatment program for psychiatric inpatients that combined both milieu and behavioral principles. Basic concepts in the design of the program included the idea of a therapeutic community, the reinforcement of adaptive behavior, the identification and subsequent ignoring of maladaptive behaviors, and the maintenance of family and community contacts to insure environmental support for the patient's return to everyday life. Details of the behavioral modification and therapeutic community procedures used are described, and evaluative data are presented which show that in an 18-mo period, of 595 consecutive admissions, 584 were eventually discharged. The average stay was 11-12 days.—*L. Gorsev.*

12345. MacDonald, Marian L. (State U New York, Stony Brook) **Methods for the assessment of change in hospitalized psychiatric populations: A substantive review.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 131.

12346. Maratos, Jason & Kennedy, Margaret J. (London Hosp, England) **Evaluation of ward group meetings in a psychiatric unit of a general hospital.** *British Journal of Psychiatry*, 1974(Nov), Vol 125, 479-482.—2 psychiatric wards in a general hospital containing a total of 90 patients were used alternately as S and control groups, each taking part for a 9-wk period in weekly ward and staff meetings. The effect on patients' behavior was assessed by comparing the number of disruptive incidents recorded in the nurses' notes, and by scores on 2 rating scales—the Ward Atmosphere Scale and an attitude scale designed to elicit feelings about ward meetings. The former measure showed significant differences in patients' behavior, particularly in a reduction of the number of times medication was refused and the number of abscondings on both wards during the periods in which meetings were held. It is suggested that ward meetings, in providing an opportunity for verbal expression of hostility, prevented some of the nonverbal acting out of these feelings.—*Journal summary.*

12347. Marquis, Hugh & Gendreau, Paul. (Rideau Correctional Ctr, Burritts Rapids, Ontario, Canada) **Short-term educational upgrading on a contractual basis.** *Journal of Community Psychology*, 1975(Jan), Vol 3(1), 94-95.—Examines the effectiveness of a contractual method for obtaining educational services for inmate training from outside a correctional institution. 22 inmates in a correctional institution were studied; 12 completed a 3-mo course, and 10 were offered no

training but were also tested after 3 mo. Results show that, compared with controls, experimental Ss increased by a half grade level in arithmetic and spelling. There was little change in reading ability. It is concluded that educational upgrading is a slow process when educational programs of this type are involved.—*R. S. Albin.*

12348. Meikle, Stewart; Gerritse, Richard & Pearce, Keith. (U Calgary, Alberta, Canada) **Diagnostic practice in a psychiatric unit.** *Canadian Psychiatric Association Journal*, 1974(Jun), Vol 19(3), 287-290.—Studied diagnoses of 161 consecutive inpatient admissions, at admission and at time of discharge. Some diagnoses made on admission were more stable than others: 80% of those initially diagnosed as schizophrenic were given the same diagnosis on discharge, but only 55% of those initially diagnosed as neurotic had the same diagnosis on discharge. (French summary)—*F. Auld.*

12349. Menolascino, Frank J. (U Nebraska, Psychiatric Inst, Omaha) **Changing developmental perspectives in Down's syndrome.** *Child Psychiatry & Human Development*, 1974(Sum), Vol 4(4), 205-215.—Studied 30 male and 42 female 25-45 yr old patients with Down's syndrome at a large public institution. Observations showed a wide and a heightened range of developments which are inconsistent with the low expectations usually voiced and practiced by professionals. Study results strongly suggest that the old set of ideas concerning individuals with Down's syndrome—from the prognosis of very low social-adaptive levels to the need for prompt and prolonged institutionalization—must be re-evaluated. (26 ref)—*Journal abstract.*

12350. Niskanen, P. (Helsinki U Central Hosp, Psychiatric Clinic, Finland) **Treatment results achieved in psychiatric day hospital care: A follow-up of 100 patients.** *Acta Psychiatrica Scandinavica*, 1974, Vol 50(4), 401-409.—A series of 100 consecutive day-hospital patients were evaluated for their clinical condition and working ability at the beginning and end of their initial day hospitalization and again 4 yrs after discharge from the day hospital unit. Results show that in 52 cases, the patient's clinical condition improved under day hospitalization, whereas in the remaining 48 cases it either remained unchanged or deteriorated. In 30 cases, the patient's working ability improved. The 4-yr follow-up revealed that in 77% of the 52 patients whose condition had improved, the favorable treatment results had been of a lasting character. In the 48 patients who had failed to make improvement during day hospitalization, improvement in clinical condition was observed in 40% and improvement in working ability in 36% of the cases. Results demonstrate that these patients, who had been unable to benefit by day hospitalization, later showed as much as or even more improvement than those patients who had made improvement under day hospital treatment.—*Journal abstract.*

12351. Schwartz, Jeffrey & Bellack, Alan S. (U Pittsburgh) **A comparison of a token economy with standard inpatient treatment.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 107-108.—Used the Nurses Observation Scale for Inpatient Evaluation (NOSIE-30) to evaluate a token economy ward at a large psychiatric hospital in comparison with 3 nontoken wards in the same unit. The token economy

appeared to be more effective in generating a broad range of behavior changes, including both an increase in positive behaviors and a decrease in negative behaviors.

12352. Smith, Stuart L. & English, John. (St Joseph's Hosp, Inpatient Service, Hamilton, Ontario, Canada) **The training and role of nurse-therapists in a general hospital's psychiatric unit.** *Hospital & Community Psychiatry*, 1975(Jan), Vol 26(1), 21-24.—Describes the training of the 1st nurse-therapists on a general hospital psychiatric unit and the 3-level training system established to make the program self-sustaining. The nurse-therapist system is currently used on several psychiatric units in the hospital. Problems in role relationships and schedules are discussed. It is believed that, considering the patient-care, economic, and staff benefits, the system would be especially useful in small inpatient units.—*Journal abstract.*

12353. Tansella, Michele. (U Padova, Istituto di Clinica Psichiatrica di Verona, Italy) **An institution-based register in a psychiatric university clinic.** *Psichiatrica Clinica*, 1974, Vol 7(2), 84-88.—Discusses the functions and limitations of psychiatric registers and describes the automated data collection system in use at the Psychiatric University Clinic of Verona, Italy. Results of the periodic monitoring of the 1st 3 years of activity of this institution show that (a) the number of inpatient neurotics decreased and schizophrenics increased as a function of later initiated outpatient service; (b) overall average length of hospitalization remained unchanged; (c) females tended to stay in the hospital longer than males regardless of age or diagnosis; (d) the number of admissions for attempted suicides increased steadily; and (e) only 1.6% of the patients were transferred to the psychiatric hospital under certificate, indicating that a psychiatric department in a general hospital can cope with a wide range of patients. (15 ref)—*Journal abstract.*

12354. Wershow, Harold J. & Reinhart, George. (U Alabama, Birmingham) **Life change and hospitalization: A heretical view.** *Journal of Psychosomatic Research*, 1974(Dec), Vol 18(6), 393-401.—Hypothesized that a high proportion of newly admitted patients would have high life change unit (LCU) scores based on the Schedule of Recent Experiences and that the scores would be higher in the 6 mo immediately preceding hospitalization than in the 7-12 mo before. 88 male patients (90% over 40 yrs old) were studied. No significant relationships were found.—*W. G. Shipman.*

12355. Whittaker, James K. (U Washington, School of Social Work) **Evaluating residential treatment.** *Child Care Quarterly*, 1974(Fal), Vol 3(3), 195-196.—Criticizes research on effectiveness of residential treatment programs and points out difficulties of various research methods. The single-case design, involving comparison of baseline and treatment conditions, is suggested as a potentially useful alternative.

## EDUCATIONAL PSYCHOLOGY

12356. Anastasio, Ernest J. **Computer-based education: Obstacles to its use and plans for future action.** *Viewpoints*, 1974(Jul), Vol 50(4), 11-37.—De-

scribes a study designed to identify the specific obstacles to acceptance of computers in education, and to evaluate plans for surmounting them. Various examples are quoted to show how a multilevel program of research and implementation might be directed toward overcoming the most critical obstacles.

12357. Anderson, G. Ernest. **The computer in education: Yesterday, today, and . . . ?** *Viewpoints*, 1974(Jul), Vol 50(4), 1-10.—Considers the background of computer use in education, and current attendant problems, such as what happens to people in organizations with the advent of the computer.

12358. Bickel, P. J.; Hammel, E. A. & O'Connell, J. W. (U California, Graduate Div, Berkeley) **Sex bias in graduate admissions: Data from Berkeley.** *Science*, 1975(Feb), Vol 187(4175), 398-404.—Examined the aggregate data on admissions to the University of California Graduate Division for fall 1973, showing a clear but misleading pattern of bias against female applicants. The disaggregated data, however, revealed few units showing significant departures from expected frequencies of female admissions and about the same number of units favoring females as favoring males. Pooling the data and correcting for the tendency of females to apply to departments more difficult for applicants of either sex to enter, a small but significant bias in favor of females appeared. Departments that are easier to enter are generally those which require more mathematics in the preparatory courses, from which it is concluded that the bias in the aggregated data stems, in part, from prior screening at lower educational levels. Females are directed by their education and socialization toward fields that are more crowded, less productive of degrees, and less well funded and that frequently offer poorer professional employment opportunities. It is suggested that the university can, through research and use of its powers, determine where and how much bias exists and equalize the preparation of males and females at primary and secondary levels for entry into all academic fields.—*Journal summary*.

12359. Bjerstedt, Ake (Ed.). (Malmö School of Education, Sweden) **Environment-oriented and organization-oriented research: Some current projects at the Malmö School of Education.** *Educational & Psychological Interactions*, 1974(Dec), No 50, 29 p.—Details the aims, backgrounds, and main features of 3 educational research projects: (a) the combination of individualized teaching and social training by varying the sizes of groups and by team teaching and the construction of suitable evaluation instruments, (b) the development of preschool activities and materials and the promotion of organizational collaboration between preschool and primary school levels, and (c) the development of search strategies for educational research and documentation.—B. McLean.

12360. Bortner, Rayman W.; Dubin, Samuel S.; Hultsch, David F. & Withall, John. (Pennsylvania State U) **Adults as learners: Proceedings of a conference.** University Park, PA: Pennsylvania State University, 1974. 200 p.—Presents a collection of 11 conference papers which examined issues related to adult learning. Topics include the social significance of adult learning, a

humanistic approach to adult education, and information processing in adult learners. (19 ref)

12361. Gran, Bertil; Gran, Birgitta; Rudvall, Göte & Röhr, Gunilla. [Some current research and development projects in the Malmö region with relevance for the proposals by SIA, the Swedish State Committee on the internal work of the school.] (Swed) *Pedagogisk-Psykologiska Problem*, 1974(Nov), No 259, 63 p.

12362. Hale, Frank W. (Ohio State U) **A sprinkle of pepper: The state of black influence in white colleges and universities.** *Journal of Non-White Concerns in Personnel & Guidance*, 1975(Jan), Vol 3(2), 45-52.—Reviews continuing sources of discrimination affecting black students in white colleges and universities. Problems involving black faculty and administrators are also noted.

12363. Huff, Terry M. & Schnelle, John F. (Middle Tennessee State U) **Discrimination between appropriate and inappropriate classroom behaviors by well behaved and poorly behaved students.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1247-1253.—Compared 14 well-behaved male 5th, 6th, and 7th graders with 16 poorly behaved Ss in ability to point out inappropriate behaviors on a video tape. Ss' responses were compared to responses made by 4 teachers who saw the same video tape. Well-behaved and poorly behaved groups were defined by 2 different categorization methods: teachers' judgment and behavioral rating by independent Os. A Group  $\times$  Categories analysis of variance with repeated measures on categories yielded no significant differences between groups with either definition of groups. A point-biserial correlation of -.22 was found between the grouping of Ss by teachers' judgments and the behavioral ratings.—*Journal abstract*.

12364. Siegel, Arthur I.; Federman, Phillip J. & Burkett, James R. (Applied Psychological Services, Wayne, PA) **Increasing and evaluating the readability of Air Force written materials.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 201.

12365. Sklerov, Audrey J. (City Coll, City U New York) **The effect of preschool experience on the cognitive style of reflectivity-impulsivity of disadvantaged children.** *Graduate Research in Education & Related Disciplines*, 1974(Spr-Sum), Vol 7(2), 77-91.—Attempted to determine whether children who had attended a 1-yr Project Head Start preschool program would demonstrate a more reflective conceptual tempo than children from similar backgrounds who had not participated in such a program. The 32 Ss came from 2 kindergarten classes, taught by the same teacher, in a public school in a lower-class area of New York City. The 16 experimental Ss, participants in the Head Start program, were matched for sex, race, and age with 16 nonparticipating Ss. The preschool form of the children's version of the Matching Familiar Figures Test was administered to all Ss after 2 mo of kindergarten experience. The test was scored for response latency and errors. Results support the hypothesis, since the Ss with Head Start experience had significantly longer response time and significantly fewer errors than the control Ss. (30 ref)—C. Tatham.

**Readability of textual material: A survey of the literature.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 202.

### School Administration & Educational Processes

12367. Arundel, Geraldine. (Norwalk-La Mirada Unified School District, CA) **An exploratory study comparing attitudes of three groups of educators toward orthopedically handicapped children as measured by pupillary dilation.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 138.

12368. Bjerstedt, A. (Ed.). (Malmö School of Education, Sweden) **Teacher-oriented research: Some current projects at the Malmö School of Education.** *Didaktik*, 1974(Dec), No 46, 34 p.—Summarizes 4 research projects concerned with the role of the teacher in education: (a) an analysis of the extent to which teacher training matches the requirements of the present and future roles of the teacher, and the development of teacher-training materials; (b) an analysis of the effects of closed-circuit TV and video recorders on student-teachers' perception and evaluation of their own teaching performance; (c) job analyses to determine the training and further education needed by school principals, lecturers in methodology, and tutors; and (d) construction of a model for the planning, execution, evaluation, and revision of job training for principals, methods lecturers, and tutors.—*B. McLean*.

12369. Calkins, E. Virginia et al. (U Missouri, Medical School, Kansas City) **Impact on admission to a school of medicine of an innovation in selection procedures.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1135-1142.—Reports the impact of innovative selection procedures on admission to a university's 6-yr combined baccalaureate and doctor of medicine program. In 1973 and 1974, the school's Council on Selection de-emphasized high school academic performance but continued to consider extensive biographical and interview data. Significant differences emerged in the correlations of various selection criteria with the Council's ratings of candidates in 1973 and 1974 in comparison with the prior years. Specifically, admission test score which had the highest correlation (.58) in 1972 was only .18 in 1973. The negative correlation (-.30) of race (discriminatory toward nonwhites) in 1972 was not present in 1973 or 1974. Instead, the highest correlations were the interviewers' ratings and recommended decisions.—*Journal abstract*.

12370. Crabtree, Walden. (U Akron) **A clarification of the teacher's role in moral education.** *Religious Education*, 1974(Nov-Dec), Vol. 69(6), 643-653.—Discusses value-related goals of public education and how teachers can attain them, since studies show that teachers influence values either deliberately or inadvertently and are expected to be value educators. Inappropriate methods of character education are those that indoctrinate rigidly, or assume that all values are already known, or fail to be open-minded and objective. Appropriate methods are consistent with 2 goals: a process of intelligent valuing and a commitment to justice. 5 indirect and 4 direct modes of value change are discussed and recommended. (18 ref)—*R. D. Kahoe*.

12371. Cruickshank, Donald R.; Kennedy, John J. & Myers, Betty. (Ohio State U) **Perceived problems of**

**secondary school teachers.** *Journal of Educational Research*, 1974(Dec), Vol 68(4), 154-159.—Collected from a national sample of secondary school teachers, raw problems perceived by them. These problems served as the basis for a 105-problem checklist administered to a 2nd teacher sample for verification. This sample represented 10% of faculty members in 26 schools. 310 teachers returned the mailed checklist. Of the problems on the checklist, teachers indicated that 42 were bothersome, frequently occurring, or both. Teacher bothersomeness and frequency responses were factor-analyzed, resulting in 7 salient factors for the bothersomeness data (Efficiency, Support, Invigoration, Control, Inclusion, Nurturance, and Influencing) and 7 factors for the frequency data (Security, Remediation, Invigoration, Control, Satisfaction, Support, and Time). Findings indicate that, with respect to bothersomeness factors, Invigoration and Control possessed the greatest number of significantly bothersome specific problems. The findings suggest that particular human needs are exacerbated when the role of secondary teacher is assumed.—*Journal abstract*.

12372. Dawson, Patrick J.; Dawson, Karen E. & Forness, Steven R. (U California, Los Angeles) **Effect of video feedback on teacher behavior.** *Journal of Educational Research*, 1975(Jan), Vol 68(5), 197-201.—Employed undergraduate student-teachers as their own models in videotape sequences of classroom performance. In Exp I, 1 male and 1 female teacher of adolescent students were given video feedback of their teaching behavior in regard to 2 types of teacher "postures," the effect of which was to change their behavior in specific directions. Exp II, a replication with 3 female teachers, was conducted with elementary students and demonstrated that change in specific teacher behaviors appeared to produce changes in academic response rate in pupils. Results are discussed relative to teacher training.—*Journal abstract*.

12373. Fritzell, Christer. [The teacher's occupational functions: Evaluations of interview and critical incident material.] (Swed) *Pedagogisk-Psykologiska Problem*, 1974(Nov), No 256, 81 p.—Presents questionnaire data on school-leaders' and teacher-trainers' evaluations of variables based on interviews and critical incident studies. The 2 sets of variables are evaluated according to 2 different criteria: the importance and the adequacy of present teacher education. Results are detailed with respect to factor analyses and evaluations of structural units by different subgroups. (15 ref)—*English summary*.

12374. Green, James A. & Gerard, Harold B. (U California, Los Angeles) **School desegregation and ethnic attitudes.** In H. L. Fromkin & J. J. Sherwood (Eds), *Integrating the organization: A social psychological analysis*. New York, NY: Free Press, 1974. xxiv, 370 p. \$14.95.

12375. Hall, Keith A. **CARE: Computer assisted renewal education.** *Viewpoints*, 1974(Jul), Vol 50(4), 65-79.—Describes a special program developed at Pennsylvania State University, comprised of a series of mobile computer assisted instruction courses for training teachers of handicapped children.

12376. Harbet, Shelia C. (Queensborough Community Coll) **Prevention through drug education: A behavioral**

**approach.** *Journal of School Health*, 1974(Apr), Vol 44(4), 221-222.—Describes workshops for elementary and secondary school teachers who wish to learn more about drug abuse. Methods and content of such workshops are discussed.

12377. **Heinrich, Hanns Ch.** [Assessment scales for expressions of positive and negative reinforcement by teachers.] (Germ) *Zeitschrift für Experimentelle und Angewandte Psychologie*, 1974, Vol 21(4), 530-545.—Asked 560 boys and girls 9-14 yrs old to characterize the behavior of their home room teachers on a questionnaire consisting of 23 positive and 22 negative reinforcement statements. Factor analysis of the results yielded a final questionnaire of sufficient discriminatory power and reliability, consisting of 15 statements of each type. Both male and female teachers were considered severe more often by boys than by girls. Younger children found teachers' behavior more supportive than did older children. (English & French summaries)—*W. J. Koppitz*.

12378. **Holt, James.** Involving the users in school planning. *School Review*, 1974(Aug), Vol 82(4), 707-730.—Asserts that school planners need to maintain direct, continual involvement with the users of school facilities—the students, the teachers, and the citizens who must pay the bills.

12379. **Julian, Joseph & Layne, Phillip J.** (U Nebraska, Lincoln) Effectiveness and styles of leadership in black student programs. *Journal of Non-White Concerns in Personnel & Guidance*, 1975(Jan), Vol 3(2), 66-73.—Surveyed the directors of black student programs in 15 midwestern universities. The importance of adequate student financial support, tutorial assistance, and a democratic leadership style in program administrators is stressed.

12380. **Meyers, C. Edward; Yoshida, Roland K. & Genrich, Carol J.** (U Southern California) A symposium on some unheralded parameters of Piaget in the schools. In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.

12381. **Nolen, Patricia.** (U Washington) Piaget and the school psychologist. In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.—Considers that, despite their differences, the work of Piaget and of the school psychologist are in fundamental correspondence. A school psychologist's assessment of the learning problems of an elementary school child, examination of cognitive strategies, interpretation of intelligence and achievement test results, and planning of remediation are discussed from the point of view of Piagetian concepts.

12382. **Peterson, Richard E.** (Educational Testing Service, Berkeley, CA) Institutional goals and curriculum planning. *Findings*, 1974, Vol 1(2), 5-8.—Discusses institutional goals and curriculum planning at California state colleges. Of the 180 accredited institutions in

California, 116 distributed the Institutional Goals Inventory in the late spring of 1972. The 20 goal areas covered by this instrument were academic development, accountability/efficiency, advanced training, community, cultural awareness, democratic governance, freedom, humanism, personal development, innovation, intellectual environment, intellectual orientation, meeting local needs, off-campus learning, public service, research, social criticism, social egalitarianism, traditional religiousness, and vocational preparation. Chief areas of conflict among faculty, students, and trustees were individual personal development, social/political relevancy, and career preparation with students typically in conflict with the rest of the university community. Implications for student behavior are drawn.—*R. S. Albin*.

12383. **Pohlmann, John T.** (Southern Illinois U, Carbondale) A multivariate analysis of selected class characteristic and student ratings of instruction. *Multivariate Behavioral Research*, 1975(Jan), Vol 10(1), 81-91.—Administered the Instructional Improvement Questionnaire to more than 33,000 students at a single university to obtain ratings of the characteristics of 1,247 courses and determine the relationship between these characteristics and student ratings of the instructors. Results indicate that the class characteristics that had the strongest influence on the results of instructor ratings were the grades expected by students and the percentage of students in the class taking the course as an elective.—*Journal abstract*.

12384. **Qurik, Thomas J.; Trismen, Donald A.; Nalin, Katherine B. & Weinberg, Susan F.** (Principia Coll) The classroom behavior of teachers during compensatory reading instruction. *Journal of Educational Research*, 1975(Jan), Vol 68(5), 185-192.—Investigated the classroom behavior of 135 teachers in compensatory reading programs (Grades 2, 4, and 6) in 21 cities. A special observation instrument was designed to categorize teacher behavior during reading instruction, and reliability data are reported for the 46 Os (mostly teachers) who were trained to use this instrument. Each class was visited on 9 occasions for 15 min of coding during each visit. Data are reported in terms of the average amount of time spent in each mode and content activity across the teachers in these programs.—*Journal abstract*.

12385. **Robison, Helen; Jagoda, Eleanor & Blotner, Roberta.** (Bernard M. Baruch Coll, City U New York) Competency-based teacher training: Skinner vs. Piaget in classification. In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.

12386. **Rodewald, H. Keith.** (Central Michigan U) Reply to Walsh's comments on Rodewald and Carroll. *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1254.—Considers inaccuracies in J. A. Walsh's (1974) comments on H. K. Rodewald and J. L. Carroll's (see PA, Vol 53:1952) project on scaling of students' attitudes toward their professors. A restatement of the scaling problem is made.

12387. Romine, Stephen. (U Colorado) **Student and faculty perceptions of an effective university instructional climate.** *Journal of Educational Research*, 1974(Dec), Vol 68(4), 139-143.—Sought to ascertain perceptions of an effective instructional climate through use of a 71-item questionnaire, administered to 1,237 students and 268 faculty members representing all levels of undergraduate and graduate students and faculty. Statistical analysis yielded a list of 40 significant attributes grouped into 7 clusters. Factor-loading values were derived for the attributes to facilitate utilization in describing and assessing instructional climate. Students and faculty agreed generally on a global concept of instructional climate and as to the significance of many individual attributes. Greater significance was attached to instructors and their teaching role than to students and their learning role. Practical uses of the results are suggested.—*Journal abstract*.

12388. Schafer, Paul J. (Saint Bonaventure U) **Critical thinking ability of teachers.** *Journal of Instructional Psychology*, 1974(Fal), Vol 1(4), 39-40.—Administered the Watson-Glaser Critical Thinking Appraisal to 200 teachers. Findings indicate that (a) female teachers demonstrated a higher level of critical thinking than male teachers; (b) suburban teachers showed a higher level of critical thinking than city teachers; (c) teachers who were graduated from a liberal arts college demonstrated a higher level of critical thinking than teachers graduated from a state college; and (d) teachers with various years of experience exhibited no significant difference in their ability to think critically. The 1st 3 differences were significant ( $p < .05$ ). There was no significant difference among the scores for teachers with various years of experience.—P. O'Brien.

12389. Shapiro, Stewart B. & Shiflett, John M. (U California, Santa Barbara) **Loss of connectedness during an elementary teacher training program.** *Journal of Educational Research*, 1974(Dec), Vol 68(4), 144-148.—Evaluated the impact of Gestalt awareness training as a component in a 1-yr preservice elementary teacher training program. Ss were 70 trainees. An unanticipated finding emerged when both experimental and control groups displayed a statistically significant decrease in "connectedness" (a general attitude of trust and positive affiliation with others). This major finding from D. T. Campbell's connectedness scale was subjected to a detailed statistical analysis and supplemented by intensive clinical interviews. Major alternative statistical and substantive hypotheses are explored utilizing the expanded data base, and possible implications for teacher training programs are considered. (27 ref)—*Journal abstract*.

12390. Smith, H. W. & Meyer, F. J. (Southwestern at Memphis) **Parent and teacher attitudes toward and knowledge of drug abuse.** *Journal of School Health*, 1974(Mar), Vol 44(3), 152-155.—Administered a questionnaire on knowledge about drugs and attitudes toward drug abuse to elementary school teachers, high school teachers, and parents in a southeastern urban area in order to provide information for the development of a drug education program in the public schools. Results indicate a general lack of accurate drug information among parents and teachers, suggesting that neither

group is qualified to provide drug information to students. Parental responses were generally more conservative than teacher responses, especially in areas of drug control and legalization. Although the majority of each group indicated a willingness to contribute to drug prevention efforts, the lack of accurate drug information and the initial reluctance to participate in the survey pose potential problems for an effective drug prevention program in the public schools.—A. de la Haba.

12391. Struck, Ursula. [Studies of the effectiveness and problems of preschool education in the United States.] (Germ) *Psychologie in Erziehung und Unterricht*, 1973, Vol 20(1), 36-48.—Discusses studies by J. McV. Hunt (1961) and B. S. Bloom (1964) in which concern with minorities is seen as vitally important to preschool programs. Also discussed are the evaluation of creativity, motivation, and emotional stability of pupils, and the effect of various kinds of teachers on individual children and on the permanence of educational gains. (41 ref)

12392. Wax, Douglas E. (U Michigan, Medical Ctr) **A collaborative-interactive model for mental health consultation: Teacher inservice education by psychiatric clinicians.** *Child Psychiatry & Human Development*, 1974(Win), Vol 5(2), 78-88.—Presents a consultation model, based on a didactic use of humanistic psychology, in which educator and clinician collaborate in seeking answers to questions raised by current examples from the teachers' classroom experience. Excerpts from a 4-yr program and data regarding effectiveness are given.—E. S. Goodman.

12393. Woods, Linda L. & Woods, Thomas L. (Chicago Public Schools, IL) **Substitute: A psychological study.** *Elementary School Journal*, 1974(Dec), Vol 75(3), 162-167.—Compares the reactions of pupils to a substitute teacher with that of children reacting to a step-parent. If the relationship between the regular teacher and the class was good, pupil reaction to the substitute should in a measure continue to be favorable. If the regular relationship was strained, pupils may compensate either by various forms of disorder or by excessive friendliness, openly comparing the regular teacher unfavorably with the substitute. The regular teacher may also have negative or positive feelings toward the class and toward the substitute. The substitute may in turn compensate for these varied responses. It is recommended that the substitute should receive training in performing her delicate task of interaction and adjustment. The school administrator should not consider the substitute as a "baby-sitter" but as a colleague.—A. J. Ter Keurst.

12394. Zwick, Mark L. (Dept of Mental Health, Stanislaus County, Modesto, CA) **Parent education groups.** *Social Work*, 1974(Nov), Vol 19(6), 729-731.—Contends that parental involvement is an essential ingredient of the educational process. Findings of a county program involving groups of teachers, administrators, and parents are presented to support the contention.

#### Curriculum Development & Teaching Methods

12395. American Psychological Assn, Div on the Teaching of Psychology. (Washington, DC) **Teaching of psychology newsletter: 1965-1974. Catalog of Selected Documents in Psychology**, 1974(Fal), Vol 4, 107-108.

12396. **Ariel, Abraham.** (California State U, Los Angeles) **Piaget, behavior modification and the adolescent with learning disabilities.** In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.

12397. **Ažman, Jože.** [Why students learn particular subjects.] (Sloe) *Anthropos*, 1972, No 3-4, 71-74.—Studied reasons why Slovenian high school students learned various subjects. Multiple-choice questions offered 3 alternative answers: (a) "for life," (b) "for the grade," and (c) "because I must." Ss were 101 male and 119 female 11th grade students. Results show that 2 languages, Slovenian and English (but not French and German) were the most popular subjects while history, national defense, and mathematics were the least popular. Female students preferred languages, male students preferred the mathematical sciences. A detailed list of reasons why students like or dislike various subjects is given. Implications for educational practices are discussed.—S. Slak.

12398. **Baker, L. J.** (U Dublin, Trinity Coll, Ireland) **Comparison of a lecture course with a Keller course in introductory psychology for university freshmen.** *Irish Journal of Psychology*, 1974(Win), Vol 2(3), 183-201.—47 undergraduates enrolled in a general studies school for psychology were matched into pairs on the first quiz of an F. Keller (1966) course. Half continued in the Keller course and the other half received lectures for the course. The Keller or quiz course students were found to be superior in performance on a number of measures: attendance, laboratory reports, preference for examination, quiz, or essay, and a posttest quiz. There was no difference in performance by the 2 groups on the posttest essay or the final examination essay. The question is raised of whether previous studies reporting improvement in student essay examinations can be assumed to have shown that such procedures will improve essay performance in the traditional European essay writing examination as opposed to the rather different American essay examination. It is suggested that Keller courses in the British Isles should be planned to strengthen this particular behavior in students subjected to the European tradition of university examination. (40 ref)—*Journal abstract*.

12399. **Barr, Rebecca A.** (U Chicago, Reading Clinic) **Instructional pace differences and their effect on reading acquisition.** *Reading Research Quarterly*, 1973-1974, Vol 9(4), 526-554.—Explored the influence of homogeneous and differential pacing of classes on basal word learning and mastery, and the effect of basal word learning on general reading achievement. In one investigation, 19 pupils paced homogeneously were compared with 20 paced differentially; in another, 45 pupils from 4 classes that differed in differential pacing were compared. Ss were classified in terms of aptitude, and multivariate analysis was used to test the effects of various levels of pace on Ss' word learning. In classes that were differentially paced at relatively high rates, mean level of word learning and variance were higher than in classes differentially paced at slow rates or for

those homogeneously paced. Generally, a faster rather than a slower pace facilitated learning and mastery of a sight vocabulary for most high-aptitude and some average pupils. All low-aptitude pupils were paced slowly; their word learning and mastery tended to be lower than that of other children. For students paced differentially, basal words learned during 1st grade accounted for a considerable portion of the variance of word recognition measured at the end of 1st grade and of vocabulary and comprehension measured at the end of 2nd grade. Although the trends were the same for pupils paced homogeneously, the percentage of shared variation was considerably less. (French & Spanish summaries)—*Journal abstract*.

12400. **Bearison, David J.** (Graduate School & University Ctr, City U New York) **Is "school achievement" enhanced by teaching children operational concepts?** In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.

12401. **Bengis, Laraine.** (City Coll, City U New York) **The degree of persuasibility among open classroom children and traditional classroom children: A comparative study.** *Graduate Research in Education & Related Disciplines*, 1974(Spring-Summer), Vol 7(2), 53-76.—Tested the hypothesis that children who have experienced 3 yrs of open classroom schooling will be less persuasible than comparable groups of children who have experienced 3 yrs of traditional schooling. Abelson and Lesser's Persuasibility Booklet was administered to 56 3rd-grade students from 2 New York City schools, 30 from a traditional classroom and 26 from an open classroom. Persuasibility was scored as the number of agreements between the communicator and the child. The  $t$  value was significant ( $p < .01$ ), thus supporting the hypothesis. It is concluded that children from open classrooms seem to be more autonomous and more independent in their thinking than traditionally-taught students. (16 ref)—C. Tatham.

12402. **Birk, Janice M. et al.** (U Maryland) **A content analysis of sexual bias in commonly used psychology textbooks.** *Catalog of Selected Documents in Psychology*, 1974(Fall), Vol 4, 107.

12403. **Biskin, Donald & Hoskisson, Kenneth.** (Virginia Polytechnic Inst & State U) **Moral development through children's literature.** *Elementary School Journal*, 1974(Dec), Vol 75(3), 153-157.—Presents L. Kohlberg's stages of moral thinking as a basis for selecting children's literature for moral education. These stages are as follows: (a) The child confuses obligation with his own desires. (b) His obligation is the result of external coercion. (c) His obligation is to satisfy his own needs to the exclusion of the needs of others. (d) He feels obligated to be "good and nice" as a result of social expectation. (e) Obligation and responsibility are linked to maintain social order. (f) The child feels an obligation to personal values as well as to societally determined rules. (g) Moral judgments concerning a personal obligation are based on a universal moral right. Children's literature has an enormous potential to develop

moral structures. As the development in moral thinking differs little from the development of cognitive thinking, the school's program should be based on developmental stages, regardless of the culture or social background of the children.—A. J. Ter Keurst.

12404. Bleil, Gordon B. (Edmark Assoc, Bellevue, WA) **Evaluating educational materials.** *Journal of Learning Disabilities*, 1975(Jan), Vol 8(1), 12-19.—Offers methods for individual teachers to use in selecting and evaluating educational materials. Good and bad things to look for subjectively are specified and techniques of objective evaluation are suggested. The need for standards of accountability is stressed.

12405. Boseman, F. Glenn & Schellenberger, Robert E. (Temple U) **Business gaming: An empirical appraisal.** *Simulation & Games*, 1974(Dec), Vol 5(4), 383-402.—Examines the perceptions and attitudes of students toward management games as a teaching aid and tests actual learning attainment in business policy courses.

12406. Broughton, Sam F. (U Georgia) **The unwitting behavior modifier.** *Elementary School Journal*, 1974(Dec), Vol 75(3), 143-151.—Suggests that many teachers develop control over unmanageable pupils through conditioning processes which they use unconsciously. They overlook the conditioning mechanisms which are continually found to some degree in all behavior of all learning organisms. Positive reinforcement, punishment, vicarious consequences, and extinction are discussed. Teachers are constantly conditioning their pupils, who in turn condition their teachers. Few individuals have such a catholic view of their own behavior that they are aware of their own conditioning patterns and how they are conditioned by others. Several studies illustrate the results of the conditioning processes among pupils. (20 ref)—A. J. Ter Keurst.

12407. Caliguri, Joseph P. (U Missouri, Kansas City) **Traditional and emerging policy issues for staff development with particular implications in drug education.** *Journal of Drug Education*, 1974(Fal), Vol 4(3), 331-336.—Presents an overview of policy issues regarding staff development programs and incentives to increase motivation and productivity in educational programs. Issues related to governance and accountability are also discussed.

12408. Chistyakova, G. D. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of General & Pedagogical Psychology, Moscow) **[A psychological study of the content structure of a text in relation to the problem of comprehension.]** (Russ) *Voprosy Psikhologii*, 1974(Jul-Aug), No 4, 115-127.—Studied the relationship between the structure of educational texts and their comprehensibility. Popular scientific texts in 3 areas were analyzed and their denotative structures diagrammed. Comprehension was studied by comparing the accuracy of Ss' reports on their readings with the original text as a function of the number of perusals and the particular denotative structure of the text. Depth of comprehension was specific by referring it to hierarchical levels of the text structure. It is argued that a text reflects the object relations of reality, and these may serve as a measure of the reader's ability to comprehend the text. (English summary)—L. Zusne.

12409. Christopher, G. Ronald. **An administrative perspective on computer assisted instruction.** *Viewpoints*, 1974(Jul), Vol 50(4), 53-63.—Presents objective data, subjective conclusions, and personal reactions regarding computer assisted instruction at Ohio State University.

12410. Clark, Alice T. (U North Dakota) **Follow-up on follow through.** *Measurement & Evaluation in Guidance*, 1975(Jan), Vol 7(4), 234-238.—Describes a technique to evaluate a local Follow Through project by the people involved with it. Subjective judgments were collected and systematically organized through the use of a paired-comparison inventory requiring 58 professional and parent participants to make 120 paired comparisons on 16 traits identified as most characteristic of the Follow Through program. The 2 most valued characteristics of the program were "classroom aides" and "individualized instruction in small groups." The 2 least valued characteristics were "parent involvement" and "parent coordinators." Implications for local Follow Through program, the National Follow Through office, and the non-Follow-Through classrooms in the schools are noted.—*Journal abstract.*

12411. Cohen, Stuart J. & Hillman, Stephen B. (U Toledo) **The effects of behavioral objectives on the achievement of students knowledgeable about the use of objectives.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 136.

12412. Collins, J. K.; Francis, R. D. & Cassel, A. J. (Macquarie U, North Ryde, NSW, Australia) **The teaching and assessment of introductory psychology at Macquarie University: History and self appraisal.** *Australian Psychologist*, 1974(Mar), Vol 9(1), 35-43.—Evaluated an introductory course in psychology. Assessment was of 2 types: (a) examination of 268 students and (b) evaluation by the students. Students were given a pre- and post-course multiple-choice objective test. All items were from C. T. Morgan and R. A. King's "Objective Questions for Introduction to Psychology" (1971). Students rated their lectures, using a 7-point scale, for rated content, delivery, perceived interest, speed of presentation, and level of presentation. The findings indicate a need to improve introductory psychology courses in universities.—J. C. Figurelli.

12413. Crutchfield, Marjorie A. (Loyola-Marymount U) **Conservation training and school readiness.** In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.

12414. Dennison, Paul E. **Reading programs are means—not ends.** *Reading Teacher*, 1974(Oct), Vol 28(1), 10-12.—Challenges the idea that reading is merely a process of decoding an objective message existing outside of the reader. This attitude does injustice to the reader and to what he reads. It fails to recognize that reading is a part of the language acquisition process, and therefore an inherently subjective activity. Real reading must be an experience, not just an exercise. Coordinators, directors, administrators, and teachers of reading must remember that the "end" is the growing child. His self-concept as a worthwhile human being, capable of

solving problems, finding order in chaos, and teaching himself, is all that a teacher can really give him.—P. D. Leedy.

12415. Durkin, Dolores. (U Illinois) **Some questions about questionable instructional materials: I. Reading Teacher**, 1974(Oct), Vol 28(1), 13-17.—Conducted a 6-yr study that revealed 2 clear and persistent features of classroom instruction: (a) Teachers were spending time on unnecessary and even erroneous instruction. (b) Such instruction was often the result of an unquestioning use of basal reader manuals and workbooks. Mistakes in teaching children to read that stem from the materials given the children are pointed out.—P. D. Leedy.

12416. Evans, David R.; Hearn, Margaret T. & Zwirner, Walter W. (U Western Ontario, London, Canada) **Need achievement training with grade-nine students. Canadian Journal of Behavioural Science**, 1975(Jan), Vol 7(1), 54-59.—To examine the effect of achievement motivation training on academic achievement, 81 students were given a 15-wk need achievement training course as part of their regular curriculum during the 1st semester of Grade 9. They were compared with 108 Grade-9 students in another school who did not receive the course. The difference in mean change in language arts and science was not significant, while the mean change in need achievement, mathematics, social studies, and academic average was significant and in the predicted direction. (French summary)—*Journal abstract*.

12417. Faust, Gerald W. **Design strategy and the TICCIT system. Viewpoints**, 1974(Jul), Vol 50(4), 91-101.—Discusses the design science approach to educational innovation, particularly in the area of computer assisted instruction, and describes currently produced courseware design strategies.

12418. Frederick, Franz J. **PLANIT: A "machine-independent" CAI language and system. Viewpoints**, 1974(Jul), Vol 50(4), 81-90.—Describes the ICU/PLANIT system, a computer assisted instruction language and system designed to be relatively machine independent. Configuration and implementation details and basic costs are specified.

12419. Gheorghiu, Alexandru & Cretu, Virginia. **[Efficiency of the teaching process when integrated with school television broadcasts.] (Fren) Revue de Pedagogie**, 1973, No 7, 84-96.—420 3rd-yr lyceum students in human anatomy and physiology classes were tested for proficiency in the subject matter, first under traditional teaching conditions, then when the teaching was supplemented by the use of TV. 3 levels of course objectives were defined: knowledge of facts (Ca), generalization to and correlation with already known concepts (Cb), and application to concrete situations (Cc). After traditional teaching, 22% of the Ca objectives, 9% of the Cb objectives, and 3% of the Cc objectives were met. A pretest of the students' knowledge of the material to be taught with TV revealed that 18% of the Ca, 25% of the Cb, and 15% of the Cc objectives were already met. After TV lessons, which maximized illustrations and applications, were added to the regular teaching, 80% of the Ca, 50% of the Cb, and 62% of the Cc objectives were met. Gains in motivation and

performance quality were also noted. (English summary)—L. R. Johnson.

12420. Goldstein, Bobbye S. (PS 9, Manhattan, NY) **What's cooking in the reading program? Reading Teacher**, 1974(Oct), Vol 28(1), 22-25.—Describes how a reading specialist at a public school in New York City maintains a reading resource room and skills center and has developed creative readers through the use of cookbooks which the children illustrate.

12428. Kapes, Jerome T. & Strickler, Robert E. (Lehigh U, School of Education) **A longitudinal study of change in work values between ninth and twelfth grades as related to high school curriculum. Journal of Vocational Behavior**, 1975(Feb), Vol 6(1), 81-93.—Hypothesized that important changes in work values occur between 9th and 12th grades and that these changes

differ depending on the students' high school curriculum. The Occupational Values Inventory (OVI), an ipsative instrument with a forced choice format containing work value statements with a 7th-grade reading level, was readministered to 659 high school seniors who had taken the OVI 3 yrs previously when they were in 9th grade. Results indicate that 5 of the 7 OVI values did change over the 3-yr period and at least some of this change appeared to be related to the students' high school curriculum. Other important findings are that (a) the "Salary" value experienced the greatest increase; (b) value intensity changed so that strong values grew stronger and weak values weaker; and (c) the Home Economics curriculum, which was totally female, experienced almost no change in work values while all other curriculums changed on at least 3 values. (29 ref) —*Journal abstract.*

(U Maryland, Medical School, Baltimore) **A unique school health program in a school for pregnant teenagers.** *Journal of School Health*, 1974(Jun), Vol 44(6), 303-306.—Describes a special school system for the pregnant teenager and outlines a new and unique school health program developed specifically for use within this system. Program results are discussed and recommendations are made for improvements in the approach.

12430. Kerin, Roger; Harvey, Michael & Crandall, N. Frederick. (Southern Methodist U) **Student course selection in a non-requirement program: An exploratory study.** *Journal of Educational Research*, 1975(Jan), Vol 68(5), 175-177.—Administered a questionnaire to 100 business school university undergraduates to investigate the decision process of course selection in a nonrequirement program in which the student was primarily responsible for program planning. It was hoped that findings would (a) serve as a diagnostic tool for administrators evaluating the merits of nonrequirement programs and (b) serve a pragmatic purpose for administrators as a source of data from which predictions of success or failure of nonrequirement systems could be made. Results show that major considerations in course selections were personal interest in the area, course content, compatibility with major field, and instructor. Major information sources used by Ss were friends, catalog descriptions, and faculty members (other than advisors). Therefore, both informal and formal information sources were explored by students.—*Journal abstract.*

12431. Kingsley, Edward H. & Stelzer, John. (Human Resources Research Organization, Alexandria, VA) **A theoretical basis for individualized instruction.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 203.

12432. Kirkwood, J. M. (U Lancaster, England) **Analysing the linguistic and cultural content of foreign language text-books: An application of variety theory.** *IRAL: International Review of Applied Linguistics in Language Teaching*, 1973(Nov), Vol 11(4), 369-385.—Analyzes 2 texts on English as a foreign language from the point of view of the number and realism of different speaker roles and of the sociolinguistic contexts presented.

12433. Knowles, Lyle. (Pepperdine U) **The traditional and tutorial classrooms compared: Academic performance among undergraduate students in basic statistics courses.** *Journal of Instructional Psychology*, 1974(Fal), Vol 1(4), 18-25.—Investigated empirically measured differences in academic performance of 117 undergraduate statistics students by comparing achievement in 2 traditional classroom modes and the new weekend tutorial mode. All classes were conducted in identical ways except for differences in time frame. Background data are examined among the groups, as well as scores on 9 performance variables. Results show that, except for initial "slow start," the weekend tutorial mode students, who were older and full-time employed, performed as well as younger, part-time employed students who attended class sessions in the traditional 2 mornings/wk mode. Performance was highest in the 1 evening/wk mode among older, full-time employed students who were enrolled in fewer academic units for the school term.—*Journal abstract.*

12434. Kobayashi, Yukiko. (Tokyo U of Education, Japan) **[Effects of teacher's question on the learning of prose material.]** (Japn) *Japanese Journal of Educational Psychology*, 1974(Jun), Vol 22(2), 120-125.—Describes how children's learning is affected by the timing and frequency of questioning, by the amount of information included in the questions, and by pupils' knowledge of the results. Other factors discussed include reinforcement, the teacher-pupil relationship, and the structure of teaching materials.—*S. Choe.*

12435. Komachiya, Megumi. (Komatsugawa High School, Japan) **[On the training of oral summarization of English reading materials by the direct method.]** (Japn) *Japanese Journal of Educational Psychology*, 1974(Jun), Vol 22(2), 91-99.—Asked 87 Japanese high school students in 3 groups to read and summarize a story written in English. Measures of useful communication unit, useless communication unit, summarization judgment, and the number of words were compared with posttraining measures of the same variables. During the training period Experimental Group 1 was asked to summarize the story following a model summary given by E. Experimental Group 2 was asked to answer orally questions which covered the same information contained in the model given to Group 1. Results show that the method of questions and answers was most effective for acquisition of oral communication skills. (English summary)—*S. Choe.*

12436. Kurtz, P. D. (Pennsylvania State U) **The effect of instructional objectives on student learning.** *Alberta Journal of Educational Research*, 1974(Dec), Vol 20(4), 327-333.—Examined the effect of student knowledge of instructional objectives on learning from written material. 140 Grade-6 Ss were randomly assigned to either a group which was given practice in objectives or one which was given no practice in objectives. After 3 practice sessions, all Ss were given a 1,500-word prose passage to read. Prior to reading the passage, Ss received 1 of the 3 orienting stimuli: (a) application objective, (b) recall objective, and (c) directional statement. Using analysis of covariance to compare groups, results indicate that the type of instructional objective did not facilitate application, recall, or incidental learning.

Practice in the use of instructional objectives had a significantly negative effect on immediate and delayed incidental learning. Findings suggest that knowledge of an objective prior to instruction does not stimulate learning.—*Journal abstract.*

12437. Langer, Philip. (U Colorado, School of Education) **Phase II: A modularized/individualized secondary educational psychology program.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 135-136.

12438. Lewis, John & Adank, Richard. (Winona State Coll) **Mastery or trial-and-error learning in an individualized program.** *Journal of Instructional Psychology*, 1974(Fal), Vol 1(4), 26-27.—Conducted an investigation to determine if 300 elementary school pupils in an individualized program were reacting to learning unit mastery tests in a trial and error manner. A tabulation was made of the frequency of passing and failing on mastery tests which were given at the end of each learning unit for pupils in grades 1 through 6 at a school in which the Westinghouse PLAN method of individualized instruction was used. 80% of all mastery tests were passed on the 1st trial, and those failed on the 1st effort were usually passed on the 2nd. Significant differences appeared among grade levels ( $p < .001$ ) and subject areas ( $p = .001$ ).—*Journal abstract.*

12439. Lindell, Ebbe. [Two research projects on language education: A review.] (Swed) *Pedagogisk Dokumentation*, 1974(Nov), No 30, 15 p.—Summarizes language-education projects which have (a) mapped instructional goals and constructed tests in connection with them, (b) used the tests to make the goals explicit for teachers and students, (c) used the measures as pretests to make individualization possible, (d) attempted measures for such individualization, (e) investigated students' work during the studies, and (f) experimentally tried different contents and methods. Problems concerning the planning of university education are discussed. (41 ref)—*English summary.*

12440. Lowe, A. J. & Follman, John. (U South Florida, Coll of Education) **Comparison of the Dolch List with other word lists.** *Reading Teacher*, 1974(Oct), Vol 28(1), 40-44.—Attempted to determine the rankings of the 1st 150 Dolch words in 4 other ranked word lists and 3 word list studies of basal readers. The hypothesis that the 1st 150 words of the Dolch List would be useful at any teaching level (kindergarten through adult) was confirmed by statistical tests.—*P. D. Leedy.*

12441. Lucas, Ann F. (Fairleigh Dickinson U) **Educational implications of Piaget's theory: Montessori a viable option.** In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.

12442. Lutz, John. (East Carolina U) **Some comments on psycholinguistic research and education.** *Reading Teacher*, 1974(Oct), Vol 28(1), 36-39.—Oversimplified language in primers seems to be the result of the fallacious notion that reading development must recapitulate speech or general language development. It is contended that reading is an outgrowth of language, and

therefore reading development need not return to the original developmental level of general language ability. The child should be allowed to use the language structures which he already knows.—*P. D. Leedy.*

12443. Margolis, Joseph A. (Brooklyn Coll, City U New York) **An experimental lesson in drug education.** *Journal of Drug Education*, 1974(Fal), Vol 4(3), 327-330.—Describes a method of making drug education more relevant for today's high school and college student through the use of an experimental lesson on drug taking. The lesson examines the reasons and motivations for drug taking in a setting that is close to reality. It describes a methodology for stimulating student interest in an area where young people may feel they have exhausted much of the drug education information available to them.—*Journal abstract.*

12444. McCracken, Robert A. (Western Washington State Coll) **A comparative study of modalities in beginning reading instruction.** *Reading Teacher*, 1974(Oct), Vol 28(1), 6-9.—Attempted to determine if children who were taught using the sapiditory modality learned more effectively when the modality was used alone or in combination with auditory, visual, and kinesthetic modalities. All Ss were kindergarten and 1st-grade children from families with incomes below the poverty level. All learned equally well under each of the 4 modalities.—*P. D. Leedy.*

12445. McLaughlin, T. F. & Malaby, J. E. (U Kansas) **Set of procedures to improve accuracy of performance and decrease time to complete mathematics problems.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1092.—2 experiments show that 6th graders increased their accuracy of performance, maintained perfect or near perfect scores, and decreased the amount of time to complete mathematics problems when given token reinforcement points for doing so. When given points for poor performance and more time to complete the problems, Ss' performance decreased and the time to complete the problems increased.

12446. McLaughlin, T. F. & Malaby, J. E. (U Kansas) **Note on combined and separate effects of token reinforcement and response cost on completing assignments.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1132.—A study of a combination 5th- and 6th-grade class indicates that approximately 100% of the class completed their work each time token reinforcement and response cost procedures were both in effect. When each procedure was used alone, the percent of assignments completed decreased.

12447. McLaughlin, T. F. (U Kansas) **A review of applications of group-contingency procedures used in behavior modification in the regular classroom: Some recommendations for school personnel.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1299-1303.—Reviews selected studies on the use of group contingencies in regular school classroom research. A comparison between the effectiveness of group and individual contingencies and the positive and negative features of group contingencies is presented. Recommendations for the school practitioner are included.—*Journal abstract.*

12448. Melching, William H. **Qualitative review of terminal objectives in reading.** *HumRRO Professional Paper*, 1974(Nov), No 21-74, 8 p.—Describes an attempt

to apply a specially developed classification system to a set of terminal objectives in reading. The classification system contained 5 factors, of 3 levels each. Some 312 terminal objectives (and 766 approximations) were classified by 3 raters. Agreement among raters was sketchy at the start of the rating but improved dramatically with practice. It is concluded that (a) classifying objectives is a useful procedure by which to evaluate their communicability, (b) the verb is probably the most important aspect of an objective, and (c) reading objectives are no more difficult to classify than are objectives in other instructional content areas.—*Journal abstract.*

12449. Michaels, James W. **Classroom reward structures and academic performance.** *Center for Social Organization of Schools, Johns Hopkins University*, 1974(Dec), No 186, 38 p.—Discusses the general shortcomings of the traditional classroom reward structure in light of performance-reward principles of demonstrable effectiveness. 4 alternative general reward structures are analyzed and studies comparing their effectiveness are reviewed. Although none of the reward structures was found to be consistently superior in terms of strengthening academic performance, group reward structures were consistently superior to individual reward structures in strengthening several intra-group processes. Although the appropriateness of a particular general reward structure may vary from one case to another according to resources and goals, effectiveness is apparently strongly affected by the particular operationalization of the general reward structure. (28 ref) —*Journal abstract.*

12450. Morrell, James E. et al. (Centennial Public School District, Warminster, PA) **Cognitive and affective effects of audio-programed electronic feedback and oral teacher feedback.** *AV Communication Review*, 1974(Fal), Vol 22(3), 303-315.—2 groups of 5th graders received daily instruction in a science unit followed by a summary, review, and reinforcement session conducted either by a teacher or via audiotape. 85 teacher-directed Ss were asked to respond to questions orally while 53 Ss using the tapes responded to questions in a multiple-choice format by pressing one of 3 keys on the tape machines. There were no differences between the 2 groups in achievement nor in anxiety or defensiveness (as measured by the Test Anxiety Scale for Children and the Defensiveness Scale for Children). Boys consistently achieved higher scores than girls. Differences were also found between high-ability and low-ability groups.—*D. E. Anderson.*

12451. Myers, Eddie E. (Educational Research Council of America, Cleveland, OH) **The effects of a drug education curriculum based on a causal approach to human behavior.** *Journal of Drug Education*, 1974(Fal), Vol 4(3), 309-316.—Used a pretest-posttest design to measure the effects of a senior high school drug education curriculum. Content and activities were directed toward education in human behavior and potential, in general, as well as specifically applied to drug use and abuse. Data from 1,031 treatment Ss demonstrate positive effects upon student drug knowledge, behavior knowledge, and developmental attitudes when compared to 624 control Ss.—*Journal abstract.*

12452. New York State Coalition for Family Planning, Sex Education Task Force, College Subcommittee. **Position paper: Human sexuality programs on the college campus.** *Journal of School Health*, 1974(Mar), Vol 44(3), 126-129.—Discusses the importance of implementing programs in sexuality on college campuses. In accepting their responsibility to educate the whole person colleges cannot ignore the concept of sexuality, a crucial developmental issue during college years. A comprehensive program must include areas other than sex education (e.g., counseling services, health and medical services, and student personnel services). Examples of programs in each of these areas are included. The need to evaluate the effectiveness of any program implemented is emphasized.—*F. L. Beyer.*

12453. Newman, Arthur J. (U Florida) **On the desirability of conditioning for world peace.** *Elementary School Journal*, 1974(Dec), Vol 75(3), 138-142.—Discusses whether childhood indoctrination is compatible with the democratic ethic. It is not if the indoctrination process induces agreement by irrational means disguised to seem reasonable. Children's acceptance of war illustrates the conditioning process that incorporates irrational indoctrination.

12454. Nilsson, Bengt. [Sentence elements and sentence structure in the teaching of German: A comparison between German newspaper text (Bildzeitung) and Swedish textbooks in German.] (Swed) *Pedagogisk-Psykologiska Problem*, 1974(Jun), No 242, 112 p.—Examines the way in which sentence elements are constructed (word-class structure) and analyzes the contents of Swedish textbooks. The text in 6 issues of the German daily newspaper *Bildzeitung* is studied. Pedagogical recommendations are made on the basis of the results, and models for an alphabetic and a frequency word-list based on the text from *Bildzeitung* are presented. (46 ref)—*English summary.*

12455. Novak, Mark W. (U Winnipeg, Quebec, Canada) **Living and learning in the free school.** *Interchange*, 1974, Vol 5(2), 1-10.—Examines the problems that arose at 1 free school as staff members tried to define their pedagogy, their curriculum, and their organization. The teachers used a special vocabulary of motives that emphasized members' involvement or noninvolvement in activities. Involvement was viewed as the major criterion for evaluation. Success was expressed in terms such as social solidarity and gregariousness; reclusivity and nonparticipation in activities were viewed as indications of failure.—*H. E. Yuker.*

12456. O'Rourke, Thomas W. & Barr, Sanford L. (U Illinois) **Assessment of the effectiveness of the N.Y. State Drug Curriculum Guide with respect to drug attitudes.** *Journal of Drug Education*, 1974(Fal), Vol 4(3), 347-356.—Assessed the effectiveness of the revised edition of the *New York State Curriculum Guide* with respect to the affective domain dealing with the drug topic. Drug attitude test score comparisons were made between 234 high school students who received the Curriculum Guide program and 199 comparable students receiving a traditional program. Results show a significantly higher score for the experimental group. However, closer analysis revealed that the program

seemed to be effective for males but not females.—*Journal abstract.*

12457. Panepinto, Joseph. (Ctr on Alcoholism & Drug Abuse, Morgantown, WV) **Drug abuse prevention: Real or unreal?** In *Selected papers delivered at The Ninth Annual West Virginia School on Alcohol and Drug Abuse Studies, June 17-22, 1973*. Morgantown, WV: West Virginia University, 1973. 165 p.—Considers that drug-abuse prevention is possible and is contingent on the ability to develop relevant methods of preventive education, preventive treatment, and preventive rehabilitation. Specific suggestions for educational programs—from infant-parent levels through elementary and high schools to college curricula—are offered.

12458. Pikulski, John J. (U Delaware, Reading Study Ctr) **Criterion referenced measures for clinical evaluations.** *Reading World*, 1974(Dec), Vol 14(2), 116-128.—Urges that criterion-referenced measurement should be an essential activity, particularly in clinical reading programs. These measures are simply ways of determining whether goals have or have not been met. (17 ref)

12459. Rabinowitz, Herbert S. & Zimmerli, William H. (United Way of Buffalo & Erie County, Community Services Group, NY) **Effects of a health education program on junior high school students' knowledge, attitudes, and behavior concerning tobacco use.** *Journal of School Health*, 1974(Jun), Vol 44(6), 324-330.—Administered a 58-item questionnaire concerning health knowledge, attitudes, and behavior to pupils from 36 randomly selected classes in Grades 7 through 9 from five rural and urban school districts. Half the Ss received classes in health care while the other half did not. Results show that in only 2 groups was a significant difference obtained between the instructed and noninstructed groups. Significant differences in attitudes toward health but not in behavior also were demonstrated. Implications for smoking behavior are drawn. Suggestions for other ways of improving health knowledge and attitudes are presented. (25 ref)—R. S. Albin.

12460. Read, Donald A. (Worcester State Coll) **The come alive classroom: Personal approaches to good teaching in health.** *Journal of School Health*, 1974(Apr), Vol 44(4), 225-227.—Describes the "values clarification" approach to teaching used at Worcester State College. This humanistic approach to teaching utilizes processes of prizing, choosing, and acting which lead to the development of affective responses. Human relations training and transactional analysis are also included.

12461. Richardson, William M. **Research and implementation of CAI in elementary and secondary schools.** *Viewpoints*, 1974(Jul), Vol 50(4), 39-51.—Presents the results of 3 programs of Computer Assisted Instruction (CAI), carried on as part of a county project. The high school study, involving 137 students, indicated that it was possible, with computer support, to provide an individualized program in geometry for greater numbers of students per class with no significant differences in achievement. In the secondary school study, involving 58 matched pairs of students, individualized computer-based programs produced significantly greater achievement gains in arithmetic than traditional classroom drill. The 3rd study showed that 10 mentally retarded high school students benefited significantly

from a CAI arithmetic diagnostic and drill program developed for the regular school population.—G. Lowe.

12462. Rix, K. J. (U Aberdeen, Scotland) **Evening classes on alcoholism: An experiment in alcoholism education.** *British Journal of Addiction*, 1974(Mar), Vol 69(1), 33-34.—Describes an experiment in educating the general public about alcoholism through a series of 5 evening classes, conducted weekly by the Aberdeen (Scotland) and District Council on Alcoholism. Average attendance was 35. Evaluation of the lectures and suggestions for other courses, obtained by questionnaire from some of those attending, are reported. It is concluded that such classes can reach both laymen and professionals and that media involvement can heighten the effect of such classes. Objective measurement of the results of such alcoholism education is needed.—A. P. Balevre.

12463. Robertson, Douglas J. & Trepper, Terry S. (California State U, Northridge) **The effects of I.T.A. on the reading achievement of Mexican-American children.** *Reading World*, 1974(Dec), Vol 14(2), 132-139.—52 Mexican-American bilingual 4th graders, 26 who were initially instructed via the Initial Teaching Alphabet (ITA) and 26 who were taught using traditional orthography, were tested on a variety of reading achievement tests. ITA Ss scored significantly higher than the traditional group on all tests, including their reading grade level. Some reasons for the success of ITA with Mexican-American children are given.—*Journal abstract.*

12464. Shapiro, S. I. & Talone, James M. (U Hawaii) **Teaching resources for humanistic psychology.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 108.

12465. Shapiro, S. I. (U Hawaii) **Teaching the psychology of death: Fictional and nonfictional resources.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 108-109.

12466. Singer, Harry; Samuels, S. Jay & Spiroff, Jean. (U California, Reading & Language Development Committee, Riverside) **The effect of pictures and contextual conditions on learning responses to printed words.** *Reading Research Quarterly*, 1973-1974, Vol 9(4), 555-567.—Studied the effect of presenting 4 printed words in 4 different ways on the acquisition of reading responses by 164 1st and 2nd graders. The printed word was presented alone, in association with a picture, embedded in a sentence, or in a combination of sentence plus a picture. This procedure attempted to resolve the seeming conflict between Samuels's focal attention theory and Goodman's findings that presenting words in a context helped children to identify the words. The focal attention theory contends that picture and context cues deter acquisition of reading responses because they enable the child to identify the word in practice without focusing on its graphic features. Comparing both theories on trials to a criterion and on correct responses on test trials, the Ss scored best on word alone, next on word plus picture, third on word plus sentence, and worst on word plus sentence and picture. Results are seen as supporting Samuels's theory. (French & Spanish summaries)—*Journal abstract.*

12467. Snow, David L. & Brooks, Robert B. (Yale U, Medical School) **Behavior modification techniques in the school setting.** *Journal of School Health*, 1974(Apr), Vol 44(4), 198-205.—Reviews specific behavior modification techniques and aspects of the theory and procedures involved in this approach. Initial considerations include designation of the behaviors that need to be modified, obtaining a baseline measure of that behavior, and developing an appropriate intervention program. A schedule of the reinforcement needed to change behavior, and ways of increasing appropriate and decreasing inappropriate behavior, must be derived. Social reinforcement, tangible reinforcement, and token reinforcement are discussed. Time out from positive reinforcement and punishment are cited with regard to their effectiveness in changing behavior. Modeling is described as a process in which more appropriate behavior is learned through observation of significant others. (55 ref)—R. S. Albin.

12468. Sommer, Robert & Becker, Franklin. (U California, Davis) **Learning outside the classroom.** *School Review*, 1974(Aug), Vol 82(4), 601-607.—Asserts that a multiple approach to teaching-learning is necessary, in which teachers creatively integrate experiences from the field, the classroom, and the library.

12469. Stolurow, Lawrence M. **Suggestions for CAI curriculum development.** *Viewpoints*, 1974(Jul), Vol 50(4), 103-133.—Considers the problem of developing curriculums for computer assisted instruction (CAI) in the context of instructional technology. CAI aids the process of managing the individualized and personalized instructional environment. Furthermore, it can utilize more of the emerging hypotheses regarding the structuring of learning environments. Reference is made to the assessment and evaluation processes associated with and supportive of CAI curriculum development. The power of CAI in this context is based on its capabilities of replication, control of variables and conditions, and data generating potential. (34 ref)—G. Lowe.

12470. Vacca, Richard T. & Vacca, Joanne L. (Northern Illinois U) **Consider a stations approach to middle school reading instruction.** *Reading Teacher*, 1974(Oct), Vol 28(1), 18-21.—Discusses key aspects of the stations approach to reading instruction which make it worthy of consideration, especially at the middle school level. Its structure frees the teacher from the role of central performer in front of the class; he becomes a facilitator rather than the chief actor. A stations approach involves a unifying psychological principle which establishes for the pupil a rationale behind the instruction.

12471. Vandever, Thomas R. & Neville, Donald D. (Inst on Mental Retardation & Intellectual Development, Nashville, TN) **Modality aptitude and word recognition.** *Journal of Reading Behavior*, 1974(Jul), Vol 6(2), 195-201.—Determined modality aptitude for 282 2nd graders. 72 children who learned significantly more or fewer words when they were presented in one of 3 methods (visual, auditory, or kinesthetic) than in the other 2 were selected as Ss. 6 categories of Ss resulted: visual strength, visual weakness, auditory strength, auditory weakness, kinesthetic strength, and kinesthetic weakness. Visual strength and visual weakness Ss were

assigned to classes in which visual methods were used to teach. The same procedures were used for those having auditory and kinesthetic strengths and weaknesses. After 6 wks of instruction, analysis of covariance revealed that children taught to strength did no better than those taught to weakness. (18 ref)—*Journal abstract*.

12472. Vezin, Liliane. (U Paris VIII, Psychologie Lab, France) **[Effect of different forms of guidance in teaching the identification of a principle.]** (Fren) *Enfance*, 1974(Jan-Apr), No 1-2, 65-79.—Investigated the role of different forms of guidance in the identification of the principle governing the operation of a set of gear wheels. Ss were assigned to 4 experimental groups and 1 control group, each group consisting of 8 boys and 8 girls. The experimental group procedures differed in the kind and amount of supplementary information provided; the control group had no guidance. Success was evaluated by 2 tests, one calling for application of the principle and the other for transfer of the principle to another problem. Ss indicated the degree of certainty they felt about their answers to questions. All experimental groups did better than the control group on both tests. Transfer was best in the group that was led to explore the material, and this group expressed confidence in their responses more often than Ss in the other groups. The degree of correctness in estimation of responses was the same for all groups.—S. S. Marzoff.

12473. Walden, Toimi. (California State U, Fresno) **The classification skills of five, six, and seven year old bilingual, biliterate, and monolingual children.** In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.

12474. Weiss, Nancy L. & Peterson, Rolf A. (U Illinois, Chicago Circle) **A simple training procedure for improving Bender-Gestalt performance.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1299-1305.—To determine whether the performance of kindergartners who score poorly on the Bender Gestalt Test could be improved by training, protocols of 32 Ss who performed most poorly on an initial administration of the Bender were examined for change in number of errors. Protocols clearly indicate that the training resulted in significantly improved Bender scores. Poor performers who initially had a large number of rotation errors and poor performers with a large number of nonrotation errors showed about the same overall improvement in subsequent Bender performance. (18 ref)—*Journal abstract*.

12475. Werden, Patricia. (U Denver) **Health education for Indian students.** *Journal of School Health*, 1974(Jun), Vol 44(6), 319-323.—Describes the particular cultural factors that are important in developing health education programs for American Indian students. Reservation conditions coupled with lack of information about health and low socioeconomic status combine to produce a high risk population. Education for the children of this milieu should be directed toward these problems. (15 ref)

12476. Willis, Sherry L.; Cohen, Allan S. & Clement, Janet W. (Pennsylvania State U) **Formative evaluation in a cognitive developmental program for young children.**

In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.

12477. Winitz, H. & Reeds, J. A. (U Missouri, Speech & Hearing Science Lab, Kansas City) **Rapid acquisition of a foreign language (German) by the avoidance of speaking.** *IRAL: International Review of Applied Linguistics in Language Teaching*, 1973(Nov), Vol 11(4), 295-317.—Presents an automated method of language teaching based on a theory that comprehension should precede production in 2nd-language learning, since it does in 1st-language acquisition. Translation and pronunciation are avoided until comprehension, expressed nonverbally, is established. (German & French summaries)—C. A. Sherrard.

12478. Yawkey, Thomas D. & O'Meara, Karen R. (U Wisconsin, Early Childhood Study Ctr, Madison) **Precision techniques in the management of children's and teacher's behavior in an open education classroom.** *Journal of Instructional Psychology*, 1974(Fal), Vol 1(4), 9-17.—Examined the use of techniques of precision teaching in mathematical performances with 10 6-yr-old and 10 7-yr-old white middle-class Ss in an open education classroom. Ss using precision techniques significantly outperformed those not using precision teaching in acquiring single and double digit addition skills. Percentage differences between groups demonstrated the facilitative effects of precision teaching techniques with young children. (21 ref)—*Journal abstract*.

### Academic Learning & Adjustment & Achievement

12479. Baird, Leonard L. (Educational Testing Service, Princeton, NJ) **A portrait of blacks in graduate studies.** *Findings*, 1974, Vol 1(2), 1-4.—Describes the demographic characteristics of blacks in graduate programs across several disciplines. Data were collected from 278 blacks and 7,326 whites who were graduates of 94 colleges and universities in the US on a 225-item questionnaire. In addition, another sample of 126 black and 2,026 white graduate and professional school students were queried. Of 141 pertinent questions, black and white responses differed on only 22 or not quite 16%. Important differences included variations in the fields of study chosen by the 2 groups. For example, blacks tend to enter education, the social sciences, and social work but not engineering and the biological sciences. Other differences in the groups' descriptions of their graduate or professional training were evident; for example, the over-indebtedness of blacks compared to whites. Indications were that blacks were being actively recruited by schools for student positions. It is concluded that the differences between blacks and whites concerning educational opportunities and experiences are narrowing.—R. S. Albin.

12480. Colton, Frank V. (U Kentucky, Coll of Education) **Effects of giving students data on task completion time in a college media course.** *AV Communication Review*, 1974(Fal), Vol 22(3), 279-294.—Examined the premise that giving college students

time-to-task data helps their performance. Implications for individualized instruction are indicated.

12481. Cottle, Thomas J. (Children's Defense Fund of the Washington Research Project) **The felt sense of studentry.** *Interchange*, 1974, Vol 5(2), 31-41.—Asserts that institutions of higher education do not pay sufficient attention to the psychological well-being of students. College students need to renounce the past and learn to live in a new social context that usually emphasizes separation from home. They experience feelings of loneliness and have strong unmet needs for interaction with adults. Although students have reported such needs for interaction with faculty members, few institutions provide it. Furthermore, universities usually operate in such a way that they exclude discussion of the student's personal feelings. (29 ref)—H. E. Yaker.

12482. Dutch, R. D. & McCall, J. (U Aberdeen, Coll of Education, Scotland) **Transition to secondary: An experiment in a Scottish comprehensive school.** *British Journal of Educational Psychology*, 1974(Nov), Vol 44(3), 282-289.—Assessed the attainments, attitudes, personality characteristics, and friendship relations of 3 successive year groups of boys and girls ( $N = 254, 252$ , and  $234$ ) near the end of their 1st term in secondary school; the 1st group had transferred directly to the secondary school from various primary schools while the other 2 groups had spent 1 yr in a transition department. The children from the transition department were found to be better adjusted in the social and emotional domains than those who had not had this experience. These differences were more pronounced in the case of girls, children of average and low VRQ, and children coming from small primary schools.—*Journal abstract*.

12483. Eaton, M. J. & Houghton, D. M. (Orangefield Boys' School, Belfast, Northern Ireland) **The attitudes of persistent teenage absentees and regular attenders towards school and home.** *Irish Journal of Psychology*, 1974(Win), Vol 2(3), 159-175.—Administered a questionnaire to 120 persistent teenage absentees to sample their attitudes towards home and school. Their attitudes were compared with those of a matched group of regular offenders. The needs of the 2 groups at home and school were similar. There was a trend for the persistent absentees to be less satisfied that these needs were met although only among the older grammar school boys were such differences between absentees and regular attenders consistently significant ( $p < .01$ ). Persistent absence was found to be linked more with the adolescents' belief that school failed to meet their emotional needs than with any attitudes towards home. It is suggested that in cases of persistent absence in teenagers, features of school should be considered carefully before attributing such behavior to a pathological disorder.—*Journal abstract*.

12484. Farver, Albert S.; Sedlacek, William E. & Brooks, Glenwood C. (U Maryland, Baltimore County) **Longitudinal predictions of university grades for blacks and whites.** *Measurement & Evaluation in Guidance*, 1975(Jan), Vol 7(4), 243-250.—Compared predictions of freshman- through senior-year grades for 259 black and white college freshmen who enrolled in 1968 and 1969. Predictors were Scholastic Aptitude Test (SAT) Verbal and Mathematical scores and high school grades that

were used in multiple regression equations. Different patterns of prediction for different race-sex subgroups emerged. High school grade averages were less useful in predicting grades beyond the freshman year and consistently poor predictors for black males. Black males were the least predictable, and white females were the most predictable subgroup. It is concluded that predicting grades beyond the freshman year is useful and that separate prediction equations for race-sex subgroups should be employed. (26 ref)—*Journal abstract*.

12485. Fennema, Elizabeth. (U Wisconsin, Madison) **Sex differences in mathematics-learning: Why??? Elementary School Journal**, 1974(Dec), Vol 75(3), 183-190. —Considers possible causes for girls' inferior performance in mathematics. After the 4th grade the difference between the sexes seems to increase with each grade. Male superiority in the performance of spatial tasks has been confirmed, and has been attributed to the play activities of boys. Girls should actually show superior mathematical abilities because they surpass boys in verbal ability and verbal and mathematical skills are closely related. L. R. Aiken has reported that college males have a more positive attitude toward mathematics than college females, and concluded that mathematics is associated with masculine interest patterns. (34 ref)—*A. J. Ter Keurst*.

12486. Foilman, John. (U South Florida, Coll of Education) **Student ratings and student achievement. Catalog of Selected Documents in Psychology**, 1974(Fal), Vol 4, 136.

12487. Foorman, Barbara R. (U California, Reading & Language Development Program, Berkeley) **A look at reading diary studies: The state of the art and some implications from cognitive-developmental theory.** In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50. —Recommends the use of diary studies to assess individual strategies in the reading acquisition process. Discussions of 2 studies of miscue analysis (R. M. Weber, 1970; A. Biemiller, 1970) in the light of K. Goodman's (1969) general taxonomy, and of a reading diary study (R. Soderbergh, 1971) are presented, and a brief review of Piagetian and reading literature is included. (24 ref)

12488. Francis, Hazel. (U Leeds, England) **Social background, speech and learning to read. British Journal of Educational Psychology**, 1974(Nov), Vol 44(3), 290-299. —Administered a devised measure of the structural complexity of language and the Schonell Graded Word Reading Test to 50 5-7 yr olds to test the language skills of children entering school from different social backgrounds; the relationship between spoken language skill and progress in learning to read was also investigated. Results show that the speech of the socially disadvantaged children was less well-developed than that of the advantaged, but at each testing during the 1st 2 yrs of schooling this difference lay in the frequency of use of various complex forms, not in their presence or absence. Differences between children within social groups were considerable. Reading ability was related to vocabulary

skill, but there was no correlation with speech structuring skill, which was generally adequate in both groups to support early reading.—*Journal abstract*.

12489. Haase, Ann M. & Wood, John. (U Massachusetts) **The application of aptitude treatment interaction analysis to reading research. Catalog of Selected Documents in Psychology**, 1974(Fal), Vol 4, 137-138.

12490. Heinen, James R.; Kulhavy, Raymond W. & Dyer, James W. (Old Dominion U) **Context and the meaning of words in prose. Catalog of Selected Documents in Psychology**, 1974(Fal), Vol 4, 137.

12491. Holmstrom, Engin I. (American Council on Education, Office of Research, Washington, DC) **"Older" freshmen: Do they differ from "typical" undergraduates? ACE Research Reports**, 1973(Oct), Vol 8(7), 46 p. —Presents the 3rd and final report of the American Council on Education's study of atypical undergraduates. 844 students 20 yrs old or older at time of matriculation were compared with 1,675 students less than 20 yrs old to determine differences in completion of the baccalaureate degree within 4 yrs. Older Ss differed from younger ones in demographic and academic background, had lower degree aspirations, and completed the degree less often within 4 yrs. Multistage step-wise regression analyses indicate that, with differences in ability controlled, older students, particularly older women, who enrolled in highly selective 4-yr institutions were more likely to attain the baccalaureate.—*J. B. Francis*.

12492. Holmstrom, Engin I. (American Council on Education, Office of Research, Washington, DC) **Low-income students: Do they differ from "typical" undergraduates? ACE Research Reports**, 1973(Sep), Vol 8(5), 46 p. —Analyzed population estimates for a subsample of 63,510 students in the American Council on Education Cooperative Institutional Research program to determine which college characteristics give low-income students the best chances to complete their degree. Results indicate that low-income students tended to enroll in public, smaller, less selective 2- and 4-yr colleges; tended to have the same life goals, degree aspirations, activities, and interests as more affluent students; and were more likely to drop out temporarily.

12493. Hoon, Peter W. (Dalhousie U, Halifax, Nova Scotia, Canada) **Efficacy of three common study methods. Psychological Reports**, 1974(Dec), Vol 35(3), 1057-1058. —30 college males in liberal arts curricula were assigned to study passages by (a) reading, (b) reading with underlining, and (c) reading with note-taking. When verbal intelligence (measured by Verbal score on the Scholastic Aptitude Test) was held constant, the 3 groups did not differ on questions about comprehension of passages.

12494. Leeds, Donald S. (Kean Coll) **Content, interest and role as sociological factors affecting reading performance. Reading World**, 1974(Dec), Vol 14(2), 149-159. —Discusses minority groups in our society and the detrimental effect of the minority role on the self-concept of emerging individuals. It is suggested that educators, aware of the influence of textbooks on those who read them, should be alert for bias and slanted views in teaching materials. (29 ref)

12495. Liem, G. Ramsay. (Boston Coll) **Performance and satisfaction as affected by personal control over salient decisions.** *Journal of Personality & Social Psychology*, 1975(Feb), Vol 31(2), 232-240.—Investigated the effects of decision-making power on achievement in an introductory psychology course as well as attitudes toward the experience. Decision-making was manipulated by (a) allowing some of the 171 undergraduate participants to choose the type of recitation section they preferred (choice) while others received their preference by chance (no choice) and (b) manipulating the amount of student choice in the ongoing conduct of recitation sections (structured and unstructured). Choice Ss did significantly better on 1 of 3 course exams than did no-choice Ss and reported greater satisfaction with their sections and leaders. Similarly, Ss in unstructured classes gave higher ratings of satisfaction with their sections than did Ss in structured classes. Implications for structurally related but broader social problems are discussed. (18 ref)—*Journal abstract*.

12496. Lückert, Heinz-R. [Psychological aspects of maladjustment in school.] (Germ) *Psychologie in Erziehung und Unterricht*, 1973, Vol 20(1), 49-74.—Analyzes school difficulties as problems of a psychology in failure. Data are presented about the frequency of learning difficulties, retention in grade of boys and girls in schools of different levels, and reasons for academic failures advanced by other researchers. The importance to students of a positive self-concept and of peer acceptance in relation to achievement are discussed. The lack of agreement between intelligence and grades is mentioned. It is recommended that older students be taught how to educate younger children, that class sizes be reduced, that age requirements for school entrance be more flexible, and that less stress be placed on spelling. (English summary) (75 ref)—*W. O. Horn*.

12497. Morstain, Barry R. (U Delaware, Office of Academic Planning & Evaluation) **The relationship between students' personality characteristics and educational attitudes.** *Measurement & Evaluation in Guidance*, 1975(Jan), Vol 7(4), 251-258.—Administered the Omnibus Personality Inventory (OPI) and the Student Orientations Survey (SOS) to 410 undergraduates at 3 institutions. Substantial correlations between various scales of these 2 inventories were obtained. Ss were also grouped into 1 of 3 intellectual disposition categories based on their pattern of scores on the OPI. Analyses of variance of group differences in educational attitudes were significant ( $p < .001$ ) on all 10 SOS scales. A stepwise multiple discriminant analysis indicated that 6 scales were salient definers of group differences. On the whole, Ss' educational attitudes were consonant with their general personality characteristics and orientations. (16 ref)—*Journal abstract*.

12498. Nickel, Horst; Schlüter, Peter & Fenner, Hans-J. (U Düsseldorf, W Germany) **[Anxiety scores, results of intelligence testing, and the influence of the teacher's personality on students in schools of different levels.]** (Germ) *Psychologie in Erziehung und Unterricht*, 1973, Vol 20(1), 1-13.—Employed 2 American scales (the Text Anxiety Scale for Children and the Children's Manifest Anxiety Scale), adapted for German use, together with W. O. Horn's tests of 6 primary mental

abilities and R. Brickenkamp's test of concentration, to investigate the influence of anxiety on 459 boys and 383 girls aged 10, 12, and 14 yrs. Performances in German and mathematics were used for correlations and comparison of extreme groups. Girls admitted significantly more anxiety, especially at age 12. Anxiety diminished with age, quality of education, higher social class, and intelligence, and with increasing introversion and dominance of the teacher. With increasing dominance of the teacher, girls participated more, boys less, and the speed and vigilance of both boys and girls declined. (English summary) (40 ref)—*W. O. Horn*.

12499. Olson, David R. **Mass media versus schoolmen: The role of the means of instruction in the attainment of educational goals.** *Interchange*, 1974, Vol 5(2), 11-17.—Makes a distinction between knowledge and skill. Knowledge refers to information about the world and objects and events in it. Skill or ability refers to particular activities that are performed in many different contexts; i.e., ability to do something. Knowledge and skill are learned in different ways. The acquisition of knowledge, which is of secondary importance, should be turned over to the mass media. But the mastery of skill requires active performance and suitable feedback, and thus must remain in the hands of teachers. (23 ref)—*H. E. Yaker*.

12500. Prokop, M. (U Alberta, Edmonton, Canada) **Sequential analysis of foreign language verbal interaction.** *Alberta Journal of Educational Research*, 1974(Dec), Vol 20(4), 334-341.—Used a Flanders-type observation instrument to code verbal interactions among 50 students and 4 instructors in foreign-language classes. The interaction process was conceptualized as having cyclical characteristics, and each utterance was classified as being either an initiator of information-processing, a response, or an evaluation in function. The resulting strings were ordered and assigned to groups on the basis of commonalities in their internal pattern structure. 7 such response pattern types were observed, 2 of which accounted for almost 90% of all occurrences; in turn, these patterns were realized in 32 response modules depending on the type of communicative content function of initiators, responses, and evaluators. Other inferences concerning the structure of the foreign-language teaching and learning process are discussed. —*Journal abstract*.

12501. Resnik, Anton. **[Objective assessment of motivational components and their relation with academic success.]** (Slo) *Anthropos*, 1972, No 3-4, 51-60.—Investigated the association between 3 levels or types of motivation—ideational, formal, and actual—and between type of motivation and variables of academic achievement and ability, in 77 7th grade Slovenian pupils. Ideational level was measured by the number of terms of foreign origin selected by pupils from a list as being appropriate for learning. Formal level was measured by the number of arithmetic problems pupils selected as their voluntary homework, and actual level by the number of such problems solved. Ability was measured by differential aptitude tests, a battery of tests for industry, and a vocabulary test. Data were collected on academic achievement in biology, mathematics, geography, English, and Slovenian. As predicted, there

was no correlation between ideational motivation and the other 2 levels, but a strong correlation between formal and actual motivation. Ideational motivation was slightly correlated with abilities and with achievement in Slovenian, while formal and actual motivation showed strong correlations with academic achievement across subjects and ability variables. Correlations between ability, motivation, and achievement were higher when actual motivation was higher.—*S. Slak.*

12502. Rodgers, D.; Slade, K. & Conry, R. (U British Columbia, Vancouver, Canada) **Oral language, reading ability, and socioeconomic background in three grade one classes.** *Alberta Journal of Educational Research*, 1974(Dec), Vol 20(4), 316-326.—Studied 81 English-speaking Grade-1 students to examine the differences in oral language competence which exist in the "average" Canadian urban classroom. Cluster analysis was used to create 3 S groups using 7 measures of oral language competence. Results show that group membership was highly predictive of reading proficiency measured at the end of Grade 2. Further, there is evidence to support a relationship between socioeconomic area of school location and oral language competence.—*Journal abstract.*

12503. Rude, Robert T.; Niquette, Sheldon & Foxgrover, Phyllis. (Rhode Island Coll) **The retention of visual and auditory discrimination reading skills.** *Journal of Educational Research*, 1975(Jan), Vol 68(5), 192-196.—The retention of basic visual and auditory discrimination skills is of interest to kindergarten and 1st-grade teachers. The present study measured kindergartners' retention abilities over the summer vacation period, using 2 subtests from the Wisconsin Tests of Reading Skill Development-Word Attack and 2 subtests from the Murphy-Durrell Reading Readiness Analysis. Ss were 194 children in 7 kindergarten sections in all-white elementary schools. Results show that visual discrimination skills were retained to a higher degree than was the measured auditory discrimination skill. Sex of S and chronological age were not significant factors affecting retention, whereas IQ was significant. Implications for researchers and educators are discussed briefly. (20 ref)—*Journal abstract.*

12504. Sappington, Andrew & Grizzard, Robert. (U Alabama, Birmingham) **Self-discrimination responses in black school children.** *Journal of Personality & Social Psychology*, 1975(Feb), Vol 31(2), 224-231.—Previous studies have found that the performance of blacks on intellectual tasks decreases in the presence of whites. The present study attempted to determine whether this performance decrement still exists by administering 3 trials of a digit symbol task (the WAIS Digit Symbol subscale) to 40 black male 7th and 8th graders in the presence of either white or Negro counselors. The digit symbol task was labeled as either intellectual or motor skill. In addition, tests (e.g., the MMPI) were used to measure expectancy, incentive, anxiety, hostility, defensiveness, and task satisfaction. It was found that the students performed better in the presence of whites and that this was a function of task complexity and task labeling. Of several theories considered, K. W. Spence's (1958) analysis of the relationship of drive level to performance can best explain the data. No source for the

increased drive in the presence of whites was found.—*Journal abstract.*

12505. Schaller, Joseph. **Residential change and academic performance.** *Goteborg Psychological Reports*, 1974, Vol 4(6), 20 p.—Studied physical mobility as it related to both academic performance and specific areas of the curriculum. Ss were 895 Swedish elementary school children in Grades 3-8, less than half of them always in the same school. Results suggest both short- and long-term effects of a residential change for school-age children. The effects were, however, small.—*Journal abstract.*

12506. Siler, Earl R. (Clarion State Coll) **The effects of syntactic and semantic constraints on the oral reading performance of second and fourth graders.** *Reading Research Quarterly*, 1973-1974, Vol 9(4), 583-602.—Investigated the effects of syntactic and/or semantic violations on the oral reading performance of 2nd and 4th graders. Repeated measured analysis of variance for oral reading response time identified Grade Placement, Syntax, and Semantics as significant factors. Similar analysis for total sentence accuracy produced the same results. Subsequent comparisons of individual means, using the Newman-Keuls method, indicated significant changes in both criterion measures for syntactic violations, semantic violations, and combined syntactic and semantic violations ( $p < .01$ ). Syntactically violated sentences did not differ significantly from sentences violated both syntactically and semantically; however, sentences violated semantically differed significantly from sentences violated both syntactically and semantically. Findings indicate that sentences violated syntactically were also violated semantically. Syntax appeared to have a greater effect than semantics on oral reading performance. Present and past data suggested that accurate assessments of syntactic and semantic constraints on oral reading performance require the development of semantic taxonomies comparable in sophistication to those developed for syntax. (French & Spanish summaries) (32 ref)—*Journal abstract.*

12507. Soar, Robert S. & Soar, Ruth M. (U Florida, Coll of Education) **Classroom behavior, pupil characteristics and pupil growth for the school year and the summer.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 200.

12508. Symmes, Jean S. (NIH, National Inst of Child Health & Human Development, Children's Diagnostic & Study Branch, Bethesda, MD) **Reading difficulty in advantaged children.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 138.

12509. Williamson, Leon E. & Young, Freda. (New Mexico State U, Coll of Education) **The IRI and RMI diagnostic concepts should be synthesized.** *Journal of Reading Behavior*, 1974(Jul), Vol 6(2), 183-194.—Analyzed reading errors in terms of criteria from 2 informal diagnostic techniques, the Informal Reading Inventory (IRI) and the Reading Miscue Inventory (RMI). Ss were 30 upper-elementary school children who demonstrated a 5th-grade instructional level in reading. Results are interpreted by comparing reading performances at Ss' instructional and frustrational level. Percentages of miscues indicate that reading behavior was different at these 2 levels.—*W. L. Chovan.*

12510. Wilson, J. A. **Canonical relationships between environment and education.** *Irish Journal of Psychology*, 1974(Win), Vol 2(3), 129-147.—Applied canonical correlation analysis to environmental and educational variables for each of 4 samples (approximately 1,000 pupils each): 7-yr-old boys and girls and 10-yr-old boys and girls. Results confirm the hypothesis that the environmental-educational relationship is complex, but more so for 7-yr-olds than for 10-yr-olds. The nature of the relationships was inferred from an examination of the correlations of the original variables with the canonical variates. In addition to a "general" environmental-educational relationship for each sample, environmental relationships were found for brightness, backwardness, ratings, ability-attainment disparities, and test-rating disparities. Findings corroborate those of a previously reported factor analysis, and provide further evidence of a nonlinear multivariate relationship between environment and education.—*Journal abstract.*

12511. Zorman, Leon. [Theoretical and applied aspects of motivation in educational practices.] (Sloe) *Anthropos*, 1972, No 3-4, 17-25.—Opposes P. Kogej's view that secondary schools in Slovenia should consist of 25% of the most intelligent pupils, since data from the Slovenian republic show that motivational factors are much more important for academic success than intelligence. Motivation for learning is said to depend on pupil's awareness of relevance and applicability of subject matter and its appropriateness to the pupil's abilities. The correlation between socioeconomic status and educational-employment aspirations, which is higher in Slovenia than in many nonsocialist countries, also is discussed.—*S. Slak.*

### Special Education

12512. Abbott, John C. & Sabatino, David A. (Pennsylvania State U) **Teacher-mom intervention with academic high-risk preschool children.** *Exceptional Children*, 1975(Jan), Vol 41(4), 267-268.—Measured the effectiveness of having mothers serve as teachers in an experiment using the Frostig Program for the Development of Visual Perception. 25 experimental and 25 control Ss were 4-5 yr old perceptually handicapped children from a racially balanced inner-city school district. Mothers of experimental Ss administered the Frostig program for 10 wks. Control Ss followed the regular curriculum. Findings indicate that the experimental group made significant gains ( $p < .05$ ) over the control group on the Marianne Frostig Development Test of Visual Perception, and that Ss who spent more than the mean time of 525 min in intervention activities made gains over those who spent less than the mean time.—*P. O'Brien.*

Cull & R. E. Hardy (Eds), *Behavior modification in rehabilitation settings: Applied principles*. Springfield, IL: Charles C Thomas, 1974. xvii, 251 p.

12514. Bisno, Ann. **An application of the Piaget model to a curriculum for deaf-blind children.** In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings*

*Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.

12515. Davis, Patricia A. (Baltimore County Public Schools, MD) **Education of the visually impaired in the Soviet Union.** *Education of the Visually Handicapped*, 1973(Dec), Vol 5(4), 120-124.—Presents an overview of the education of the visually impaired in the USSR. Special education is generally carried out in residential schools of at least 7 different types. Children can be admitted at the age of 7 yrs. Before that age, they are the responsibility of the parent. There is very little preschool training in special education areas. Teachers of exceptional children are carefully screened, and only about 1/2 of applicants are accepted. Very little research on education of the visually handicapped has been published, or else it is inaccessible outside the USSR. It is noted that Soviet research rarely includes statistics.—*C. L. Nicholson.*

12516. Engelmann, Siegfried & Rosov, Robert. (U Oregon) **Tactual hearing experiment with deaf and hearing subjects.** *Exceptional Children*, 1975(Jan), Vol 41(4), 243-253.—Proposed to show that adequate training is necessary with a tactual device before a healthy S can perform consistently on the early words to be discriminated. In 2 experiments with a tactual vocoder it was found that both hearing and deaf Ss could learn to discriminate between words that were minimally different, and could attend to other prosodic features of language such as pitch and stress. Hearing Ss were 4 female instructors aged in their 20s; deaf Ss were 4 boys aged 8-14 yrs. Ss were tested regularly on word identification, neither looking at the trainer nor receiving any information other than that transmitted through the vocoder. 1 deaf S achieved a tactual vocabulary of 150 words and had a new word mastery rate increase of 46 times during his 48-wk training period. It is concluded that (a) deaf Ss can be taught to hear fine speech discriminations through the tactual mode, (b) the performance of Ss is positively correlated with practice and seems to be clearly a function of training, and (c) the quest for the appropriate tactual display of speech must be conducted within the training context.—*Journal abstract.*

12517. Evans, David R.; Horvath, Peter; Sanders, Sidney & Dolan, James. (U Western Ontario, London, Canada) **Reinforcement of attention and academic performance in a special education class.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1143-1146.—Exposed 14 special education students (mean age = 8 yrs) to 5 successive treatments designed to increase their attention and academic performance. Attention and Wide Range Achievement Test Reading scores were increased with the inclusion of a teacher's assistant in the setting and not as a result of token-reinforcement programs.—*Journal abstract.*

12518. Ferdinand, W. & Uhr, R. **[Are workers' children less intelligent—or really just "die Dummer?"]** *Psychologie in Erziehung und Unterricht*, 1973, (Germ) Vol 20(1), 31-35.—Compared the socioeconomic status (SES) of 2,600 pupils in schools for the mentally handicapped with the status of an unselected sample of

pupils in schools for normal children. Only 6.3% of the children in the special schools came from middle-class families, compared to 29.4% of the children in normal schools. 265 of the pupils in special schools had normal IQs (90-116), but of this group 98% were children of skilled and unskilled workers, craftsmen, and minor clerks. Of the special school students with lower IQs (42-89), over 90% came from lower socioeconomic levels. It is concluded that children of lower SES are grossly overrepresented in special schools, and that lift courses should be offered in normal schools, at least for all children of average intelligence and low achievement, to avoid their placement in special schools. (English summary) (19 ref)—*W. O. Horn.*

12519. Finch, A. J.; Pezzuti, K. A. & Nelson, W. M. (Virginia Treatment Ctr for Children, Richmond) **Locus of control and academic achievement in emotionally disturbed children.** *Journal of Consulting & Clinical Psychology*, 1975(Feb), Vol 43(1), 103.—Administered a standard achievement test and the Nowicki-Strickland Locus of Control Scale for Children to 48 emotionally disturbed children (mean age, 11.4 yrs). Results indicate that those emotionally disturbed children who perceive a relationship between their own behavior and resulting consequences obtain higher achievement scores than those who do not.

12520. Gray, William M. (U Dayton) **The integrated cognitive structures of EMH (educationally mentally handicapped) children.** In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975, 348 p. \$7.50.

12521. Hargis, Charles H.; Gickling, Edward E. & Mahmoud, Cathy C. (U Tennessee, Knoxville) **The effectiveness of TV in teaching sight words to students with learning disabilities.** *Journal of Learning Disabilities*, 1975(Jan), Vol 8(1), 37-39.—Used television to teach a set of sight words to 8 learning disabled children. Prior to the television presentations, 2 separate sets of sight words were selected and matched on the basis of equivalent difficulty level. 1 set was presented using a National Educational Television program in a series of 32 daily broadcasts; the other set of words was not presented by any teaching procedure. After instruction, each student was tested on his ability to recognize both sets of sight words. Results indicate that scores obtained through the television medium were no higher than scores which received no presentation. Results suggest that the research procedure used has relevance for individual classroom teachers and teachers dealing with small numbers of students. — *Journal abstract.*

12522. Hart, Verna. (U Pittsburgh, Program for Early Childhood Education for the Handicapped) **Beginning with the handicapped.** Springfield, IL: Charles C Thomas, 1974, xi, 128 p.—Offers behavioral approaches to changing the conduct of the handicapped child. 5 chapters are included: Where to Begin, Self-Care Skills, Motor Development, Adaptive Behavior, and Communication.

12523. Hofmeister, Alan M. (Utah State U) **Texas Sensori-Motor Training Project: A critique.** *Slow Learn-*

*ing Child: The Australian Journal on the Education of Backward Children*, 1974(Nov), Vol 21(3), 178-184.—Evaluates a project carried out at the Denton State School, using the Dolman-Delacato treatment program. The following project areas are considered: (a) control of the effects of individual attention, (b) structured instruction and testing, (c) research environment, and (d) subject identification and generalizability. It is felt that this was one of the better research projects using the Dolman-Delacato program.—*C. L. Nicholson.*

12524. Hull, Wilma A. & McCarthy, Daniel G. (Boston Coll, Campus School, Pre-School Program for Low Vision Children) **Supplementary program for pre-school visually handicapped children: Utilization of vision/increased readiness.** *Education of the Visually Handicapped*, 1973(Dec), Vol 5(4), 97-104.—Describes a supplementary program for 14 preschool visually handicapped children of the Campus School at Boston College. The goals of the program were: (a) to develop the visually impaired child's visual perception and visual efficiency; (b) to prepare the low-vision child more adequately for beginning reading; and (c) to provide evidence to determine whether the educational medium should be print or Braille, when necessary. The curriculum of the program is briefly described. Improvement was shown in the areas of visual efficiency, visual-motor integration, body image, and development of prereading skills. A questionnaire to parents indicated that (a) they reacted positively to the program; (b) the children enjoyed participating; and (c) the parents would recommend the program to other parents of visually handicapped children. (18 ref)—*C. L. Nicholson.*

12525. Jackson, Merrill. (Monash U, Clayton, Vic, Australia) **Visual feedback in word acquisition behaviour in moderately retarded subjects.** *Slow Learning Child: The Australian Journal on the Education of Backward Children*, 1974(Nov), Vol 21(3), 155-163.—Taught 12 moderately retarded children (mean age 122 mo, mean IQ 41.6) to discriminate 6 words of 3 letters each. The words were presented orally and the child was to select the printed word. 9 of the 12 Ss were able to reach criterion, indicating that such children are able to make the kind of discrimination associations necessary for reading behavior. The finding that there was no difference between the Down's syndrome Ss and the others is considered important and may serve to dispel some misgivings about their educational possibilities. Analysis of Ss who failed showed that some had not understood the association principle. (15 ref)—*C. L. Nicholson.*

12526. Kaur, Ravinder & Sen, Arun K. **Training and education of the mentally retarded children: A survey report.** *Indian Journal of Mental Retardation*, 1974(Jul), Vol 7(2), 65-71.—Notes that Indian institutions for educating and training the mentally retarded can provide care for only 2,400 patients out of the estimated 5-19 million retarded in the country. In a New Delhi home serving 87 mildly and moderately retarded children, 73 came from homes on the lower socioeconomic level. 40 had serious speech defects and 41 were retarded in motor development. It is felt that institutional care is preferable to home care for such children, since trained therapists and teachers achieve improvement in behavior and

learning that overprotective parents cannot. (17 ref)—J. H. Pflaum.

12527. Marchi, J. U. (ARAMCO Schools, Dhahran, Saudi Arabia) **Comparison of selected Piagetian tasks with the WISC as measures of mental retardation.** In G. I. Lubin, J. F. Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.

12528. Mittler, Peter. (U Manchester, Hester Adrian Research Ctr, England) **Progress and problems in the education of the mentally handicapped in the U.K.** *Slow Learning Child: The Australian Journal on the Education of Backward Children*, 1974(Nov), Vol 21(3), 140-154. —Briefly summarizes recent progress and problems in the education of the mentally retarded in the United Kingdom. In 1971 responsibility for the education of mentally handicapped children was transferred from the health to the education authorities. No child is now regarded as "ineducable" or unsuitable for education in school and all children are included, regardless of severity of the mental handicap. The following areas are discussed: early education of the child, the content of education, planning for the individual child, teacher training, experiments in integration, and post-school education. Each area is considered in terms of past practices, present status, problems encountered, and future goals.—C. L. Nicholson.

12529. Nikashina, N. A. (USSR Academy of Pedagogical Sciences, Scientific Research Inst of Defectology, Moscow) [The pedagogical study of children with a delay in psychological development.] (Russ) *Defektologiya*, 1972, No 5, 7-12.—Uses observations by scholars at the Institute of Defectology to describe the degree to which the preschool development of children with a delay in psychological development (minimal brain damage) prepares them for the mastery of school subjects, and discusses several aspects of their school performance. Suggestions are made for remediating various impediments to academic success which these children exhibit.—E. C. Koffman.

12530. Oshio, Chikamori; Tomiyasu, Yoshikazu & Komiya, Mitsuya. (Inst for Developmental Research, Aichi Prefectural Colony, Japan) [Shaping appropriate eating behavior of a profoundly retarded boy.] (Jpn) *Japanese Journal of Special Education*, 1974(Jun), Vol 12(1), 1-9.—A profoundly retarded 9-yr-old boy underwent 47 training sessions to shape appropriate eating behavior. After 5 baseline periods, his hand was manually guided by a trainer for 10 sessions. For the next 20 sessions, verbal punishment and time-out were delivered contingent upon finger feeding. For the last 12 sessions, time-out was used when he threw utensils or food, and verbal praise was given after every 2 successful spoon feedings. The progress record indicated that both positive and negative reinforcements were effective in maintaining appropriate self-feeding. During the training, the S began to interact with others in nontraining situations. (English summary)—S. Ohwaki.

12531. Pimm, June B. (U Miami, Mailman Ctr for Child Development) **The clinical use of Piagetian tasks with emotionally disturbed children.** In G. I. Lubin, J. F.

Magary & M. K. Poulsen (Eds), *Proceedings Fourth Interdisciplinary Seminar: Piagetian Theory and Its Implications for the Helping Professions: February 15, 1974: University of Southern California*. Los Angeles, CA: U Southern California, 1975. 348 p. \$7.50.

12532. Ravnmark, Anker. (School Psychological Office, Jystrup, Denmark) [Which children are referred to special residential homes (funded by sale of Christmas seals)?] (Danish) *Skolepsykologi*, 1975, Vol 12(1), 22-28. —Collected data concerning 169 schoolchildren referred in 1972-1973. Individualized teaching is required as more than half of the children (Grades 1-8) need remedial education and behavior problems are frequent.

12533. Rogow, Sally M. (U British Columbia, Vancouver, Canada) **Speech development and the blind multi-impaired child.** *Education of the Visually Handicapped*, 1973(Dec), Vol 5(4), 105-109.—Discusses the role of sensory stimulation in promoting normal speech development among multi-impaired blind children. The effects of sensory deprivation and oral sensory stimulation are also considered. The transition from passive to active forms of stimulation is traced, and the development of the haptic modality. Simply hearing speech is not sufficient motivation for speech to develop in the blind multi-impaired child; he needs active encouragement and a variety of sensory stimulation. Careful and systematic stimulation can assist the transition from passive experience of sensation to active exploration and play activities. The communication of genuine enjoyment by others of the child's efforts to vocalize help to encourage and support the vocal/verbal sequence of development.—C. L. Nicholson.

12534. Röhr, Gunilla. [Teachers' opinions of special education and pupils' development.] (Swed) *Pedagogisk-Psykologiska Problem*, 1974(Nov), No 252, 33 p.—Investigated the opinions of teachers concerning 2 types of schools, traditionally built and open-plan. Questionnaires were administered to teachers of lower, intermediate, and upper levels of the comprehensive school, assessing different approaches to the organization of special education. 2 types of coordinated special education are discussed, and their value in meeting the needs of different groups of pupils is examined.—English summary.

12535. Thornburg, Hershel D. (U Arizona) **Attitudinal determinants in holding dropouts in school.** *Journal of Educational Research*, 1975(Jan), Vol 68(5), 181-185. —Entering high school freshmen ( $N = 421$ ) during the 1971-1972 academic year in a rural Arizona high school were evaluated as to their dropout potential on several criteria, including academic grades and 8th-grade teacher evaluations. Of the 154 identified as potential dropouts, 36 were randomly selected and received a special academic program, and 118 were placed in vocational educational classes. All Ss were from the lower socioeconomic class, and a predominate number were from ethnic minorities. A control group of 94 students was randomly selected from those assigned to the regular classroom. The special academic class was designed to hold potential dropouts in school, as well as to modify some of the negative attitudes toward school with which they entered as freshmen. Results show that the special academic group maintained their attitude

toward school with no drop in attitude occurring. In contrast, potential dropouts who were assigned to vocational classes showed a slight drop in attitude toward school, while the control group showed a significant decrease. A lower dropout rate also was found among the special academic students than the other 2 groups, a fact which attests to the effectiveness of the program.—*Journal abstract.*

12536. Varma, Satish C. & Varma, Chandra K. (State U New York, Downstate Medical Ctr, Brooklyn) **Integrating mentally retarded with normal children: An experiment.** *Indian Journal of Mental Retardation*, 1974(Jul), Vol 7(2), 81-85.—Describes the successful integration of 5 mentally retarded children into a regular class of a New Delhi, India, private school. The individual and community benefits of integration are specified.

12537. Winett, Richard A.; Calkins, Debra; Douglas, Carter & Prus, Joseph. (U Kentucky) **The role of resource linker in the public schools.** *Journal of Community Psychology*, 1975(Jan), Vol 3(1), 85-87.—Describes a Kentucky public school project utilizing the model of a resource linker to alleviate behavioral and academic problems. This role involves defining specific problem areas or needs with teachers and administrators and then actually providing, developing, or "linking" the resource (available within or outside the system) to a school or school district to ameliorate the specific problems. Problems studied include disruptive classroom behavior and the large range of abilities present in the classrooms of an elementary school. Projects developed by the resource linker during the course of this study included high school aides, tutors, teacher consultations, and use of community resources. It is recommended, in light of the success of this program, that educational innovations be tied to clear measurable objectives.—R. S. Albin

### Counseling & Measurement

12538. Apter, Steven J. (Syracuse U) **The process of program development: Five years of the BRIDGE Program.** *Journal of Community Psychology*, 1975(Jan), Vol 3(1), 81-84.—Reports on the effectiveness of the BRIDGE program, a comprehensive year-round, psychoeducational program designed to aid troubled children, aged 7 to 12, to become effective participants in their regular school programs. The program includes the following facets: (a) a psycho-educational summer camp that lasts for 3-4 wks, (b) a variety of educational and recreational activities engaged in by each child and the counselor during the year, (c) a family program which provides individual and family counseling, and (d) a school program which maintains contact with every member of the staff of schools attended by participating children. Currently, the model is changing from a comprehensive direct service model to one that encompasses a more preventive educational orientation.—R. S. Albin

12539. Baker, Stanley B. & Slakter, Malcolm J. (Pennsylvania State U) **Validity and reliability of the School Counselor Attitude Inventory.** *Measurement & Evaluation in Guidance*, 1975(Jan), Vol 7(4), 239-242.—Presents data from 473 graduate counseling students

to demonstrate the construct and criterion validity and reliability of S. B. Baker's School Counselor Attitude Inventory, a 20-item measure of attitudes toward counselor strategies and characteristics.

12540. Bronzaft, Arline L. (Herbert H. Lehman Coll, City U New York) **College women want a career, marriage and children.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1031-1034.—Re-examined the career plans of 210 undergraduate females from G. Epstein and A. Bronzaft's 1972 study. Results show that 79% of the Ss expected to pursue a career, marry, and have children.—*Journal abstract.*

12541. Bruce, P. H. (Wellington Polytechnic, New Zealand) **An index of test difficulty, with applications.** *New Zealand Journal of Educational Studies*, 1974(May), Vol 9(1), 31-41.—Describes the construction and use of a coefficient of difficulty for classroom test scores among college and graduate students. Examples and applications as well as issues for use in particular types of schools are discussed.

12542. Bryson, Seymour; Bardo, Harold & Johnson, Constance. (Southern Illinois U, Rehabilitation Inst) **Black female counselor and the black male client.** *Journal of Non-White Concerns in Personnel & Guidance*, 1975(Jan), Vol 3(2), 53-58.—Reviews and summarizes the literature discussing the effect of sex on black counselor-client interaction. The psychological needs of black males and the historical role of the black female are considered. The importance of black female counselors not stereotyping the black male in the same manner as do whites is stressed. Sex is viewed to be as important a factor as race in intraracial interactions between black counselors and their clients.—R. Tomasko.

12543. Bunce, J. & Calvert, B. (U Otago, Dunedin, New Zealand) **Pupils' primary school record forms.** *New Zealand Journal of Educational Studies*, 1974(May), Vol 9(1), 42-51.—Describes research that used pupils' record forms in a New Zealand school to explore frequency of changes of school, relationships between grades in school subjects, personality ratings, father's occupational status, differences between grades and ratings for boys and girls, and characteristics of the distribution of grades and ratings by teachers.

12544. DeCato, Clifford M. (Hahnemann Medical Coll, Philadelphia, PA) **Manual for the Admissions rating scale.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 177.

12545. Flake, Muriel H.; Roach, Arthur J. & Stenning, Walter F. (Texas A&M U) **Effects of short-term counseling on career maturity of tenth-grade students.** *Journal of Vocational Behavior*, 1975(Feb), Vol 6(1), 73-80.—To study the effectiveness of short-term counseling on career maturity, the Attitude scale of Crites's Career Maturity Inventory (CMI) and the Self-Appraisal portion of the CMI Competence test were administered to a random sample of 87 10th graders. 36 Ss whose scores fell below the mean were assigned randomly to experimental and control groups. The experimental group ( $n = 17$ ) received special counseling during a short term of 6 wks. Using repeated measures of analysis of variance, a statistically significant interaction was found with both the CMI Self-Appraisal subscale scores and the total scale scores. Results indicate that career

maturity as a developmental process can be measured and facilitated through counseling. (26 ref)—*Journal abstract*.

12546. Gade, Eldon M. & Soliah, David. (U North Dakota) **Vocational Preference Inventory high point codes versus expressed choices as predictors of college major and career entry.** *Journal of Counseling Psychology*, 1975(Mar), Vol 22(2), 117-121.—For 151 male bachelor's degree university graduates, expressed choices measured by preferences made as high school seniors on the American College Test Student Profile Section were significantly more accurate predictors of graduating college major and of career entry occupation than were their Vocational Preference Inventory high point codes. There was no relationship between the Vocational Preference Inventory high point codes and the expressed choices.—*Journal abstract*.

12547. Garner, Howard G. (Virginia Commonwealth U) **Mental health benefits of small group experiences in the affective domain.** *Journal of School Health*, 1974(Jun), Vol 44(6), 314-318.—Assessed the effects of human relations training on the personal, social, and classroom adjustment of 3rd and 4th grade students ( $N = 24$ ) labelled as having behavior disorders. One group of 8 3rd graders (the experimental group) were exposed to materials and procedures from the National Training Laboratories, group interactions of the Human Development Program, stories created by the Preventive Psychiatry Program, and other human relations materials. A second group of 8 Ss (Control Group 1) was exposed merely to social interaction exercises, while another group of 8 Ss (Control Group 2) received no special attention. The experimental Ss had significantly ( $p < .05$ ) fewer changes toward maladaptive behavior than either control group, and Control Group 1 had significantly ( $p < .05$ ) fewer changes than Control Group 2. (22 ref)—*R. S. Albin*.

12548. Granowsky, Alvin & Botel, Morton. (Greensboro Schools, Diagnostic Reading Ctr, NC) **Background for a new syntactic complexity formula.** *Reading Teacher*, 1974(Oct), Vol 28(1), 31-35.—Discusses some shortcomings of conventional readability measures, and presents a newly-devised method of estimating readability based on factors in the area of grammatical syntax. The readability level is estimated on the basis of complexity score. The formula can be used by authors and editors in preparing children's materials and by teachers in evaluating and giving direction to the language experience segment of the reading program.—*P. D. Leedy*.

12549. Grant, Thomas E. & Renzulli, Joseph S. (Area Special Education Assn, Colchester, CT) **Identifying achievement potential in minority group students.** *Exceptional Children*, 1975(Jan), Vol 41(4), 255-259.—Developed an inventory to identify potentially successful college students who are from minority cultures and therefore might be missed by traditional screening procedures. An initial pool of 145 items was developed and tested with 258 high school seniors. The final instrument, entitled Relevant Aspects of Potential, consists of 30 items and is intended to supplement other methods for evaluating student performance.—*Journal abstract*.

12550. Groves, D. L.; Cauley, V. B. & Roberts, R. K. (Virginia Polytechnic Inst & State U) **Some underlying interest and occupational orientation factors of high school students interested in natural resource occupations.** *Journal of Instructional Psychology*, 1974(Fall), Vol 1(4), 28-39.—Explored the basic interest and occupational interest similarities of a high school group of 13 females and 41 males expressing preferences for natural resource occupations. The Strong Vocational Interest Blank was used to isolate interest orientations. These underlying orientations were then used to isolate what dimensions are associated with these factors. Results indicate that it is possible to isolate underlying basic interest and occupational interest dimensions and factors associated with these dimensions, so that these factors can be used as building blocks in a career education program to counsel individuals about occupational alternatives within the natural resource field. (18 ref)—*Journal abstract*.

12551. Harris, Sandra R. (U Oregon) **Sex typing in girls' career choices: A challenge to counselors.** *Vocational Guidance Quarterly*, 1974(Dec), Vol 23(2), 128-133.—Studied the efficacy of group counseling for increasing the number of tentative career choices and decreasing the percentage of sex-typed choices among middle-class 6th-grade girls. Each of 5 randomly selected Ss met with a counselor for 6 30-min sessions which included discussions, paper-and-pencil exercises, and role playing. The 13 control Ss experienced regular classwork. Pre-post testing examined future career choices and sex typing. Chi-square analyses showed that (a) there were no pretest differences between the groups for either number of tentative career choices or for sex typing; (b) at posttest, the experimental Ss had significantly ( $p < .05$ ) more tentative career choices and fewer, although not significantly, sex-typed choices. While counseling can broaden the career horizons of young girls using the methods above, other methods for reducing sex-typed thinking require investigation.—*C. A. Heikkinen*.

12552. Healy, Charles C. (U California, Graduate School of Education, Los Angeles) **Interrelationships among indexes of vocational maturity.** *Vocational Guidance Quarterly*, 1974(Dec), Vol 23(2), 146-151.—Studied intercorrelations among indices of vocational maturity including 4 scales of the Career Development Inventory (CDI), incorporation score (differences between self-rating and rating of chosen occupations on the same traits), range of incorporation (differentiation among occupations), and certainty about career plans. Ss included 60 West Coast junior college students who completed all or some of the measures before, during, and after 4 wks of career counseling. Interrelationships were determined by simple correlation. Results show that (a) degree of incorporation was unrelated to range of incorporation, pre- and postcounseling CDI measures, and certainty; (b) range of incorporation was unrelated to pre- and post-CDI measures; (c) CDI scores were generally related significantly ( $p < .05$ ) to certainty before and after counseling; (d) 2 CDI scales were more strongly related to certainty after counseling than before. Incorporation scores might become more meaningful if clients assigned weights to traits. It is considered

important to encourage clients to reflect more about different careers, and for this the CDI shows promise.—C. A. Heikkinen.

12553. Hill, John R.; Hayes, Edward J. & Young, Herman. (U Louisville) **The changing American social order: Implications for counselors.** *Journal of Non-White Concerns in Personnel & Guidance*, 1975(Jan), Vol 3(2), 59-65.—Reviews sociological data and trends having implications for the counseling of black youth. The 1970 US Census Report is cited to indicate that 60% of the black population lives in urban areas and that blacks are migrating to the city as others are leaving it. Shifting employment and educational patterns are cited to suggest that counselors place greater stress on career education and job information services. The importance of understanding black youth as individuals as a means of developing their self-esteem and motivation is stressed.—R. Tomasko.

12554. Holland, John L. & Nafziger, Dean H. (Johns Hopkins U, Ctr for Social Organization of Schools) **A note on the validity of the Self-Directed Search.** *Measurement & Evaluation in Guidance*, 1975(Jan), Vol 7(4), 259-262.—Reports that the scales of the Self-Directed Search (SDS) correlate with the scales of the Kuder Preference Record, the Thurstone Temperament Schedule, the Bennett Mechanical Comprehension Test, and the Minnesota Paper Form Board in predictable ways across 3 small samples of high school students ( $N = 158$ ). Results support the validity of the SDS as well as the hypothetical constructs in J. L. Holland's theory (1973) of vocational choice.

12555. Jepsen, David A. (U Iowa) **Vocational decision-making strategy-types: An exploratory study.** *Vocational Guidance Quarterly*, 1974(Sep), Vol 23(1), 17-23.—Explored different decision-making strategies used by 118 non-college-aspiring high school juniors in Wisconsin in an effort to identify distinctive decision-making patterns. Ss twice (8 wks apart) completed a questionnaire designed to elicit socio-economic background and responses to 32 vocational decision-making variables which were reduced by means of cluster analysis to 4 clusters: Post-high school Plans, Planning Activity, Long-range Plans, and Senior Courses. Strategy types were defined, and analysis of variance procedures tested the relationships between strategy types and cluster scores. 12 groups including 63 Ss (in groups of at least 4 each) met the requirements for strategy type. The discussion describes the 12 strategies and illustrates these by focusing on 2: the active planners and the singular fatalists. Although exploratory, the study offers insight into vocational decision-making patterns and possible counseling interventions for clients with different strategy types.—C. A. Heikkinen.

12556. Kaimann, Richard A. (Marquette U) **The coincidence of student evaluation by professor and peer group using rank correlation.** *Journal of Educational Research*, 1974(Dec), Vol 68(4), 152-153.—Investigated the hypothesis that, given the same output, an evaluation of a student by his teacher and one by his peer group would not be significantly different. The experimental group was a graduate class in production management with 25 members at the conclusion of the semester. Findings indicate that (a) student group and faculty

coincided in discerning (and grading) the difference between conversation of inconsequence and contributions of consequence; (b) weaker students tended to rank themselves low while stronger students were not shy about ranking themselves high; (c) the very vocal students, who were often abrasive, received a spectrum of rankings by the class while quiet students also received a spectrum of rankings which was wide, but narrower than that of vocal students. It is concluded from the degree of agreement between the 2 ranks that students and teachers do mutually recognize performance and achievement.—P. O'Brien.

12557. Kohen, Andrew I. & Breinich, Susan C. (Ohio State U, Ctr for Human Resource Research) **Knowledge of the world of work: A test of occupational information for young men.** *Journal of Vocational Behavior*, 1975(Feb), Vol 6(1), 133-144.—Evaluated a test of occupational information—the Knowledge of the World of Work—which was administered to a national sample of 5,000 men aged 14-24 yrs in 1966 as part of the National Longitudinal Surveys of employment behavior. The predictive validity of the test score was assessed by reference to multiple regression analyses which confirmed the significance of the score as an independent predictor of subsequent hourly earnings and occupational status. Correlation and factor analyses were used to examine the quality of the measurement instrument. Overall, the instrument was judged to exhibit desirable characteristics in terms of internal consistency reliability, discriminatory power, and level of difficulty. The test's reliability compared favorably with a commercially produced test designed to be used in counseling as a measure of occupational knowledge. With the possible modification of deleting a section relating to knowledge of earnings differentials, the test is commended to those involved in assessing and counseling the occupational choice process. (15 ref)—*Journal abstract*.

12558. Kren, Tilka & Prosnik, France. [Type and level of parents' motivations for visiting the Educational Counseling Center.] (Sloe) *Anthropos*, 1972, No 3-4, 67-70.—Studied the association level of parents' motivation for sending a child to the Educational Counseling Center and (a) reason for visit, (b) type of disturbance, and (c) parents' characteristics. 3 levels of parent motivation were: visit initiated by parents, visit recommended by the school, and visit directed by the school. Behavioral disturbances were the most important reasons for self-initiated visits, health for recommended visits, and low achievement for directed visits. The latter were most often the result of intellectual malfunctioning. Recommended visits were usually the result of neurotic symptoms. Self-initiated visits were more often associated with milder disturbances. Parents of higher educational and socioeconomic status living in urban areas were more willing to initiate the visit than low-status and rural parents. There was a correlation between success of the Center's treatment and parents' motivation. It is suggested that working with parents is essential for success of educational counseling.—S. Slak.

12559. Lauer, Rachel M. (Bureau of Child Guidance, New York, NY) **Some uses of processes in school settings.** In D. S. Milman & G. D. Goldman (Eds),

*Group process today: Evaluation and perspective.* Springfield, IL: Charles C Thomas, 1974. xxii, 313 p.

12560. Lynch, Daniel O. & Smith, Billie C. (U Wisconsin, Oshkosh) **Item response changes: Effects on test scores.** *Measurement & Evaluation in Guidance*, 1975(Jan), Vol 7(4), 220-224.—Used data from a final exam administered to 178 undergraduates to determine (a) whether changing test item responses results in better scores, (b) the relationship between the pattern and number of changes and the final score, and (c) the correlation between item difficulty and the probability of changing a given item. The odds were .68 that the student would improve his test score and .32 that he would lower the score if an item was changed. The number of response changes was significantly negatively correlated ( $-.27$ ;  $p < .025$ ) with test scores. There was also a nonsignificant tendency for low scorers to do worse than high scorers when changing answers, and a low, but significant ( $.25$ ;  $p < .025$ ) correlation between item difficulty and the number of people who changed responses to that item. It is concluded that (a) when Ss do not go over the exam, the reliability and validity of the exam is lowered, and (b) directions to stick with the 1st response to an item are misleading, an error which may have serious academic and career implications.—*L. Gorsey*.

12561. Nafziger, Dean H.; Holland, John L. & Gottfredson, Gary D. (Johns Hopkins U, Ctr for Social Organization of Schools) **Student-college congruency as a predictor of satisfaction.** *Journal of Counseling Psychology*, 1975(Mar), Vol 22(2), 132-139.—Tested hypotheses about person-environment congruency, consistency, and differentiation from J. L. Holland's (1973) theory of careers. Ss were 1,878 undergraduates from 1 college and 1 university who had been given the Self-Directed Search before their freshman year followed by a satisfaction questionnaire 1 or 3 yrs later. 2 analyses were conducted. The 1st was a 3-factor multiple analysis of variance with school, sex, and congruency level as the independent variables. The 2nd was a 4-factor multiple analysis of variance with school, sex, consistency, and differentiation as independent variables. 3 college satisfaction measures were the dependent variables. Statistically significant main effects ( $p < .05$ ) were found for school, sex, and congruency but not for consistency and differentiation. Results support Holland's congruency hypothesis but not the differentiation and consistency hypotheses. (16 ref)—*Journal abstract*.

12562. Nuthall, Graham. (U Canterbury, Christchurch, New Zealand) **Is classroom interaction research worth the effort involved?** *New Zealand Journal of Educational Studies*, 1974(May), Vol 9(1), 1-17.—Reviews the literature and describes the state of the art in research relating teacher behavior to student achievement and aptitude. Methodological issues are discussed, and suggestions are made to resolve them. Specific problems cited are (a) misleading correlations between the 2 variables, (b) difficulty in replication of results, and (c) interpretations of the data collected. It is demonstrated that the use of different statistical procedures on the data results in different findings. 2 possible interpretations of such data may be made: that pupils' achievement is simply a function of their attitudes to teacher

and school work at the beginning of the course or that the frequency of teacher criticism has a direct effect on pupil achievement.—*R. S. Albin*.

12563. Omvig, Clayton P. & Thomas, Edward G. (U Kentucky, Coll of Education) **Vocational interests of affluent suburban students.** *Vocational Guidance Quarterly*, 1974(Sep), Vol 23(1), 10-16.—Examined relationships between expressed and tested interests for 101 affluent, white, 9th-grade students and compared the data with those from a similar study of inner-city disadvantaged students. Ss completed the Ohio Vocational Interest Survey and a Likert-type scale for expressed interests in early 1973; data were subjected to simple correlation analysis. Results suggest that expressed vocational interests are useful, with the following cautions: (a) Disadvantaged males showed more consistency between expressed and tested interests than disadvantaged females; the opposite obtained for affluent students. (b) Disadvantaged students showed consistently higher interests than affluent students for all work areas. (c) High interests for disadvantaged females were people-related; high interests for affluent females lay in people-related, musical, and artistic/entertainment areas. (d) Disadvantaged males showed high interests in musical, entertainment, management, and technical areas; affluent males were highest in data-oriented, scientific, and technical interests.—*C. A. Heikkinen*.

12564. Panackal, Abraham A. & Sockloff, Alan L. (Temple U) **Factor analyses of the College Student Questionnaire.** *Measurement & Evaluation in Guidance*, 1975(Jan), Vol 7(4), 225-233.—Studied the factor structures of the College Student Questionnaire for 3 large samples of freshmen, sophomores, and seniors ( $ns = 2,586, 1,963$ , and  $1,507$ , respectively). In addition to oblique 20-factor solutions for each sample, orthogonal 17-factor solutions for freshmen and sophomores and a 16-factor solution for seniors were obtained. Similar factors across the 3 analyses were obtained. Results demonstrate the variety of information contained in these instruments and questioned the choice of some items used in the suggested scales.—*Journal abstract*.

12565. Parker, Carol; Bunch, Steven & Hagberg, Richard. (Montana State U) **Group vocational guidance with college students.** *Vocational Guidance Quarterly*, 1974(Dec), Vol 23(2), 168-172.—Describes a 7-wk group vocational exploration sequence developed for sophomores who were prospective education majors at Washington State University, based on the rationale that the process would lead to better self-selection of teachers, examination of alternative plans, and preparation of individuals for involvement in career education programs. Using a behavioral system based on points for completed course segments, the classes met for 2 hrs once each week, with time divided among lectures, quizzes, small group activities, and discussions. The specific procedures for facilitating career exploration and self-assessment are outlined, and the process is recommended for use with other groups undecided about careers.—*C. A. Heikkinen*.

12566. Payne, David A. & Halpin, W. Gerald. (U Georgia) **Use of a factored biographical inventory to identify differentially gifted adolescents.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1195-1204.—Adminis-

tered a 118-item factored biographical questionnaire to 173 male and 209 female adolescents participating in a special 8-wk program for high school juniors and seniors gifted in art, drama, foreign language, English, mathematics, music, science, and social science. Results show that females in the gifted areas had significantly different mean scores on the life-history factors of social leadership, academic achievement, scientific-artistic interests, cultural-literary interests, and maladjustment. Males in the gifted areas had significantly different mean scores on the life-history factors of intellectualism, social introversion, positive academic attitude, and sibling friction. 10 of 13 factor scales for males differentiated the academically and/or artistically talented from an additional group of 113 students with average ability. A similar result for females was found on 12 of 15 scales.—*Journal abstract.*

12567. **Prell, Siegfried.** [The influence of examination anxiety on different achievement measures.] (Germ) *Psychologie in Erziehung und Unterricht*, 1973, Vol 20(1), 14-30.—Studied the influence of anxiety by administering an enlarged German version of the Achievement Anxiety Test of R. Alpert and R. N. Haber (1960) to 27 male and 17 female education majors who also had to write a team paper and a longer essay and take a multiple-choice test. The correlation between the "debilitating" anxiety score and total achievement was significant for the whole group and the females. Anxious students, especially females, had a significantly lower essay score. The multiple-choice test and teamwork were not significantly affected. Habitual and examination anxiety were especially detrimental to achievement in essay composition. The total score based on these 3 measures was most strongly correlated with achievement in the multiple-choice test, less strongly with essay achievement, and least strongly with team achievement. (English summary) (19 ref)—*W. O. Horn.*

12568. **Reid, N. A. & Hughes, D. C.** (New Zealand Council for Educational Research, Test Development Div, Wellington) **A factorial analysis of the PAT: Reading comprehension, reading vocabulary and listening comprehension.** *New Zealand Journal of Educational Studies*, 1974(May), Vol 9(1), 18-30.—Describes a study carried out in New Zealand with primary and intermediate school students to elucidate the organization of the abilities and traits tapped by the Progressive Achievement Tests (PAT): Listening Comprehension Tests. It is concluded that there is a very large general ability component underlying this test.

12569. **Richardson, Mary S.** (New York U) **Self-concepts and role concepts in the career orientation of college women.** *Journal of Counseling Psychology*, 1975(Mar), Vol 22(2), 122-126.—Examined the relationship of 97 college women's self-concepts and role concepts to 9 career orientation variables. Ss were senior class women representing a variety of majors. Data were collected by mailed questionnaires which included a self- and role concept instrument, Eyde's Desire to Work Scale, and other locally devised career orientation measures. It was expected that (a) women with similar self- and career concepts would be career oriented and (b) women with similar self- and homemaker concepts would not be career oriented. Results support the 2nd

expectation but not the 1st. The relationship between self- and career concepts and the 2 most valid career orientation variables was somewhat stronger for women with high levels of self-esteem and women with a high level of role differentiation. (17 ref)—*Journal abstract.*

12570. **Rootman, Irving.** (U Calgary, Medical School, Alberta, Canada) **Drug use and the school counselor: Study of cases in a Canadian city.** *Journal of Drug Education*, 1974(Fal), Vol 4(3), 337-346.—Presents the results of a study of drug-related cases seen by school counselors in 4 types of schools during a 4-mo period. The overall counselor-contact rate was 3.1/1,000 students, with the highest rates in separate schools (Roman Catholic). Most referrals were self-made, with junior high school referrals more likely than senior high to come from "professional" sources. More than 1 drug was involved in the majority of cases seen, cannabis being most frequently mentioned. Differences in drugs involved by type of school were found. Although there were differences between school types in treatment approaches, those most often used were individual rather than group-oriented.—*Journal abstract.*

12571. **Sano, Takehiko.** (Kyoto U, Japan) [Changes in intelligence test performance during eighteen years.] (Japn) *Japanese Journal of Educational Psychology*, 1974(Jun), Vol 22(2), 110-114.—Studied increasing average level of intelligence of Japanese elementary school children during an 18-yr period in terms of geographical and historical differences. Pattern fluctuations on 12 subtests of the NH Intelligence Test developed by Kyoto University (1956) are described.—*S. Choe.*

12572. **Sharf, Richard S.** (U Delaware) **The relationship between the SVIB and the OAIS: Implications for counseling.** *Measurement & Evaluation in Guidance*, 1975(Jan), Vol 7(4), 215-219.—Administered the Strong Vocational Interest Blank (SVIB) and the Opinion, Attitude, and Interest Survey (OAIS) to 1,018 male and 901 female entering college freshmen. Moderate Pearson product-moment correlations between the SVIB occupational categories and the OAIS temperament and learning styles scales were obtained. Findings suggest that by examining the relationships between these 2 inventories, counselors can become more sophisticated in the use of these tests with clients. Examples of using SVIB and OAIS data in counseling situations are presented.—*Journal abstract.*

12573. **Snow, David L. & Brooks, Robert B.** (Yale U, Medical School) **A school consultation program in behavior modification.** *Journal of School Health*, 1974(Mar), Vol 44(3), 130-135.—Discusses the role of the consultant and the consultant-teacher relationship in establishing an ongoing behavior modification program on a school-wide basis. A major goal of the consultation program is to develop effective means to communicate with teachers and other school personnel. Several approaches to achieve the goal are the introduction of weekly conferences with teachers, meetings with small groups of teachers, staff meetings, or workshops. In addition to training teachers to be competent in their use of behavior modification techniques these approaches are also useful in helping to insure the ongoing use of behavior modification principles. The need for effective

follow-up procedures is emphasized. (22 ref)—A. de la Haba.

12574. Solkoff, Norman. (State U New York, Buffalo) **Race of examiner and performance on the Wechsler Intelligence Scale for Children: A replication.** *Perceptual & Motor Skills*, 1974(Dec), Vol 39(3), 1063-1066.—2 black and 2 white examiners administered the Sarason Test Anxiety Scale and the WISC to 54 black and 54 white 9-10 yr old children. As in N. Solkoff's (see PA, Vol 48:8765) previous study, results show no evidence that white examiners depressed the WISC performance of black children. All Ss in both studies were of comparable socioeconomic status. While there were significant Race of Child  $\times$  Race of Examiner interactions, the black children achieved their highest scores with a white examiner.—*Journal abstract*.

12575. Stillwell, Larry & Collison, Brooke B. (South-east Kansas Area Vocational-Technical School, Columbus) **A career development program for a small school.** *Vocational Guidance Quarterly*, 1974(Dec), Vol 23(2), 174-177.—Describes an innovative career development program appropriate for small secondary schools, organized by a school counselor, and involving local businesses. The program began with a 7-wk course consisting of (a) 2 wks for visiting business firms, both businessmen and students having guidelines to facilitate learning; (b) 2 wks for individual projects on careers or consumerism, which included taped exercises, interviews, and role-playing; (c) 2 wks for group discussions regarding firm visitation experiences and a study of the role of the consumer; and (d) 1 wk for synthesis and evaluation. Evaluation of the initial project has led to modification and expansion of the program.—C. A. Heikkinen.

12576. Suggs, Robert C. (State University Coll New York, Brockport) **An identity group experience: Changing priorities.** *Journal of Non-White Concerns in Personnel & Guidance*, 1975(Jan), Vol 3(2), 75-81.—Discusses the development of black youths' individual identity and role and suggests a model for group counseling to be used with minority group members. Literature on the identity crisis of ethnic adolescents is reviewed and the bond between group and individual identity is stressed. A 10-session group counseling program is outlined in which group members are encouraged to discuss their concerns about identity, being a black in America, their feelings of control over their destiny, and their areas of personal conflict.—R. Tomasko.

12577. Vernon, Philip E. (U Calgary, Alberta, Canada) **A restandardization of the Burt-Vernon Graded Word Reading Test.** *Western Psychologist*, 1973, Vol 4(3), 72-78.—Restandardized the Burt-Vernon Graded Word Reading Test on a random sample of students in the Calgary school system. An average of 27 Ss in each elementary grade (1-6), 18 Ss in each junior high school grade (7-9), and 9 Ss in each high school grade (10-12) were tested by 15 psychologists between October 1972 and March 1973. New norms based on the data, and a recommended revised order based on observed word difficulty, are presented. The present norms were found to be considerably more lenient than the old ones, closely comparable to recent norms for English children.—D. R. Evans.

12578. Woal, S. Theodore. (School District of Philadelphia, Div of Pupil Personnel & Counseling, PA) **A career education program for visually handicapped students.** *Vocational Guidance Quarterly*, 1974(Dec), Vol 23(2), 172-173.—Describes the inclusion of visually handicapped Philadelphia elementary students in classes on career exploration. In addition to regular ROOM TO GROW career program procedures, these students receive Braille transcriptions of written materials, exposure to visually handicapped, productively employed role-models, and field trips to firms employing handicapped workers.—C. A. Heikkinen.

## APPLIED PSYCHOLOGY

12579. Alley, William E. (Lackland Air Force Base, Personnel Research Div, TX) **Development of a data base for AFROTC management analysis: 1973 update.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 154.

12580. Alper, S. William. (IBM Corp, White Plains, NY) **Racial differences in job and work environment priorities among newly hired college graduates.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 132-134.—Conducted a study of 70 black and 179 white newly hired college graduates to assess racial differences in Ss' rated importance of various work and company characteristics. Responses to survey items asking the Ss to rate the importance of several job and company characteristics were factor analyzed. 2 factors emerged, the 1st reflecting a higher order future and growth orientation and the 2nd, a more hygienic job context factor. Results show that both black and white Ss rated the higher order growth characteristics as more important. However, black Ss rated each hygienic extrinsic item significantly higher than did white Ss.—*Journal abstract*.

12581. Anderson, Charles H. & Corts, Daniel B. (US Civil Service Commission, Personnel Research & Development Ctr, Washington, DC) **Development of a framework for a factor-ranking benchmark system of job evaluation.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 147-148.

12582. Bakeman, Roger & Beck, Stephen. (Georgia State U) **The size of informal groups in public.** *Environment & Behavior*, 1974(Sep), Vol 6(3), 378-390.—Tallied group size distributions (a) in 5 public locations on and off campus in a university town and (b) as portrayed in 2 TV soap operas. 2 Os were used for all public settings; one O monitored TV. The modal group size was 2. A random-factors model predicted group size distributions when the population was closed (5-member teams of aquanauts, living-and working in an undersea habitat) but underestimated dyadic and mixed-sex group formation in open populations. It is concluded that distributions of group sizes and mean group size remain relatively stable in different public settings. (15 ref)—S. T. Margulis.

12583. Barker, M. L. (Simon Fraser U, Burnaby, British Columbia, Canada) **Information and complexity: The conceptualization of air pollution by specialist groups.** *Environment & Behavior*, 1974(Sep), Vol 6(3), 347-377.—Examines how specialists in 5 different

professions and disciplines select and organize information about air pollution, and describes the structure and content of their conceptualizations. (26 ref)—S. T. Margulis.

12584. Benton, Arthur L. (Bangor Community Coll, U Maine at Orono, Bangor) **Inventoried vocational interests of cartographers.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 150-153.—Studied the interests of 466 male cartographers to develop a cartographer scale for the Strong Vocational Interest Blank (SVIB). Results show that (a) cartographers liked science, mathematics, and religious activities; (b) they were masculine and diverse and tended to dislike activities involving other people; and (c) their interests were most similar to those of computer programmers, public administrators, Air Force officers, and physical therapists though none of those SVIB keys adequately portrayed the interests of the cartographers. The cartographer key developed was cross-validated on 2 cartographer samples drawn from other populations ( $n = 89$ ) and was found to discriminate adequately between cartographers and men in general.—*Journal abstract.*

12585. Beunse, William E. (US Air Force Human Resources Lab, Manpower Development Branch, Alexandria, VA) **The impact of military service on low aptitude men.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 208.

12586. Brower, Sidney N. & Williamson, Penelope. (Baltimore City Dept of Planning, MD) **Outdoor recreation as a function of the urban housing environment.** *Environment & Behavior*, 1974(Sep), Vol 6(3), 295-345.—Describes residents' use of outdoor spaces (e.g., sidewalks, steps, yards, and playgrounds) in 1 middle-income and 2 low-income inner-city neighborhoods in Baltimore, Maryland.

12587. Carpenter, James B. (Lackland Air Force Base, Occupational Research Div, TX) **Sensitivity of group job descriptions to possible inaccuracies in individual job descriptions.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 149.

12588. Cumming, R. W. (Monash U, Clayton, Vic, Australia) **An engineer looks at psychology.** *Australian Psychologist*, 1974(Mar), Vol 9(1), 6-14.—Presents a presidential address to the Annual Convention of the Australian Psychological Society. A brief history of the development of psychology and the special field of engineering psychology is given. Since the 1970s there has been an increased demand for psychologists with training in engineering. Other areas in which psychologists can make a contribution are environmental psychology, government, industrial relations, law, and health care. Parallels between engineering and psychology are considered, and how similar problems in both fields are being approached. *J C Figurelli.*

12589. Cunningham, J. W.; Tuttle, Thomas C.; Floyd, John R. & Bates, Joe A. (North Carolina State U, Raleigh) **The development of the Occupation Analysis Inventory: An "ergometric" approach to an educational problem.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 144.

12590. David, Thomas G. (U Chicago) **Environmental literacy.** *School Review*, 1974(Aug), Vol 82(4), 687-705.—The physical school environment can enliven and

enrich the learning process within the school, but its potential remains largely unexamined. It is recommended that the school serve as a setting for the study of environment and as a laboratory for active environmental exploration. Environmental literacy seeks to develop an increased sensitivity to the environment on several levels of experience.—C. K. Miller.

12591. Distefano, M. K. & Pryer, Margaret W. (Central Louisiana State Hosp, Pineville) **Work behavior dimensions of psychiatric attendants and aides.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 140-142.—Conducted a study of 71 attendant and 65 psychiatric paraprofessional nursing personnel to determine the factor dimensions associated with Ss' work activities. A factor analysis of Ss' responses to an 80-item self-report job analysis questionnaire yielded 6 interpretable factors (Supervision, Physical Nursing Care, Maintaining the Ward Milieu, Medical Processing Activities, Recording Patient Behavior and Following Written Plans, and Special Therapy Activities) accounting for 50% of the variance. The factor dimensions provided a fairly clear conceptualization of Ss' work behavior as well as meaningful differentiation of the work activities associated with various types of treatment programs.—*Journal abstract.*

12592. Ferguson, D. (U Sydney, NSW, Australia) **A study of occupational stress and health.** In A. T. Welford (Ed), *Man under stress*. New York, NY: John Wiley & Sons, 1974. 140 p. \$10.95.

12593. Fisher, Allan H. & Disario, Martha R. (US Air Force Human Resources Lab, Manpower Development Div, Alexandria, VA) **Attitudes of youth toward military service in a zero-draft environment: Results of a national survey conducted in November, 1972.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 153.

12594. Getzels, J. W. (U Chicago) **Images of the classroom and visions of the learner.** *School Review*, 1974(Aug), Vol 82(4), 527-540.—Discusses various types of classrooms in relation to their effect on the learner. It is suggested that the physical construction of our buildings helps to shape our self-concepts. (15 ref)

12595. Goodale, James G. & Aagaard, A. K. (York U, Faculty of Administrative Studies, Downsview, Ontario, Canada) **Factors relating to varying reactions to the 4-day workweek.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 33-38.—Surveyed the reactions of 474 employees of an accounting division of a large multinational corporation to a 4-day, 38-hr workweek. 90% of the employees had been on the 4-day schedule from 6 mo to 1 yr, and nearly 70% were enthusiastic about the schedule. However, more specific questions, especially questions about work, produced negative responses. Fatigue and slowing down at the end of the day were reported, and servicing of customer needs and meeting with co-workers were more difficult. Supervisors perceived that work quality and output in their units were adversely affected by the 4-day workweek, although company productivity records showed no change. Significant age, sex, and salary differences were found in reactions to the 4-day schedule.—*Journal abstract.*

12596. Gump, Paul V. (U Kansas) **Operating environments in schools of open and traditional design.** *School*

*Review*, 1974(Aug), Vol 82(4), 575-593.—Presents concepts and methods of operating educational environments, and discusses open vs traditionally designed schools. Findings indicate that the open design can be used for programs providing more site and teacher variety. This mobility, however, can lead to increases in nonsubstance time.—C. K. Miller.

12597. Hill, A. B. (U Keele, England) **Work variety and individual differences in occupational boredom.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 128-131.—Examined the relationship between reported boredom and extraversion, neuroticism, intelligence, age, length of service, and work variety in 63 women engaged in press-operating jobs. Results show that boredom and fluctuations in feelings of boredom were negatively correlated with age and neuroticism (correlations significant at the 5% level). No significant correlations were found between boredom or fluctuations in boredom and length of service, intelligence, extraversion, or degree of work variety. However, day-to-day fluctuations in boredom were found to be less for older workers with little variety in their work. (17 ref)—*Journal abstract*.

12598. Holz, Robert F. & Gitter, A. George. (US Army Research Inst for the Behavioral & Social Sciences, Arlington, VA) **Assessing the quality of life in the U.S. Army.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 207.

12599. Kutash, Samuel B. **Group process in industry and professional education.** In D. S. Milman & G. D. Goldman (Eds), *Group process today: Evaluation and perspective*. Springfield, IL: Charles C Thomas, 1974. xxii, 313 p.

12600. Matteson, Michael T.; McMahon, J. Timothy & McMahon, Margaret. (U Houston) **Sex differences and job attitudes: Some unexpected findings.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1333-1334.—Discusses the traditional assumption that males and females hold different attitudes toward various aspects of their jobs and job environment. It is suggested that many of these differences may be more clearly associated with status as a household head than with sex per se.

12601. Miller, Gary G. **Some considerations in the design and utilization of simulators for technical training.** *US AFHRL Technical Report*, 1974(Aug), No 74-65, 26 p.—Reviews the literature related to simulators, training devices, and simulation in technical training. Rules and principles for the cost-effective application of simulation are included. A major finding is that fidelity can be quite low in certain procedural tasks without a decrement in performance. Other studies indicate that some complex electronic equipment can be simulated in simple, relatively inexpensive devices without having an adverse effect on training. It is concluded that, in general, few studies have been completed to validate the rules and principles of simulation that were developed over 20 yrs ago. (53 ref)—*Journal abstract*.

12602. Muchinsky, Paul M. (Iowa State U) **Consumer installment credit risks: A need for criterion refinement and validation.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 87-93.—Attempted to identify and validate empirically the dimensions of the criterion of consumer installment credit risk. 3 dimensions of the borrower's repayment behavior (missed payments, paperwork, and

delinquency) were hypothesized to be critical to the borrower's credit classification. Information on these 3 dimensions of the repayment process was recorded from 500 paid-out accounts drawn from 3 personal finance companies. 250 accounts had been classified as good credit risks; the other 250 accounts had been classified as bad credit risks. Of the 3 dimensions hypothesized to discriminate between the 2 types of accounts, 2 were validated—missed payment and delinquency. Results are discussed in the context of consumer installment financing and the prediction of credit risk. (20 ref)—*Journal abstract*.

12603. Neeb, Robert W.; Cunningham, J. W. & Pass, John J. (North Carolina State U, Raleigh) **Human attribute requirements of work elements: Further development of the Occupation Analysis Inventory.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 145.

12604. Olshavsky, Richard W.; MacKay, David B. & Sentell, Gerald. (Indiana U, Graduate School of Business) **Perceptual maps of supermarket locations.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 80-86.—Used multidimensional scaling algorithms to develop perceptual configurations of supermarket locations for 55 consumers. Individual and aggregate perceptual configurations were contrasted to an actual map of supermarket locations, and differences between configurations under 2 multidimensional scaling algorithms were described. Actual and perceived distances to each of the supermarkets were correlated with the frequency of shopping at the respective stores for each consumer. Results indicate that perceptual distances had a more significant relationship to shopping frequency than actual distances. (23 ref)—*Journal abstract*.

12605. Pinel, John P. (U British Columbia, Vancouver, Canada) **Potential of high-intensity ultrasonic sound in rat control: A reply.** *Psychological Reports*, 1974(Dec), Vol 35(3), 1084.—Discusses B. Morley and R. Abelson's 1974 criticism of the proposal that an ultrasound source capable of generating complex oscillating frequencies between 135 and 170 db could be used as a rodent-control device.

12606. Proshansky, Erta & Wolfe, Maxine. (City Coll, City U New York) **The physical setting and open education.** *School Review*, 1974(Aug), Vol 82(4), 557-574.—Discusses the implications of the open-education philosophy for the design and use of physical space. The environment of the classroom can be viewed as a direct expression of any educational philosophy and as an active part in the education process.—C. K. Miller.

12607. Proshansky, Harold M. (City U New York) **Theoretical issues in environmental psychology.** *School Review*, 1974(Aug), Vol 82(4), 541-555.—Discusses the need for theoretical analysis in individually oriented environmental psychology. The extent to which understanding will be achieved depends on systematic research and analysis rooted in appropriate, meaningful theoretical concepts. (17 ref)—C. K. Miller.

12608. Riccobono, John A. & Cunningham, J. W. (North Carolina State U, Raleigh) **Work dimensions derived through systematic job analysis: A replicated study of the Occupation Analysis Inventory.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 146.

12609. Riccobono, John A. & Cunningham, J. W. (North Carolina State U, Raleigh) **Work dimensions derived through systematic job analysis: A study of the Occupation Analysis Inventory.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 145-146.

12610. Suchner, Robert W. & More, Douglas M. (Northern Illinois U) **Stereotypes of males and females in two occupations.** *Journal of Vocational Behavior*, 1975(Feb), Vol 6(1), 1-8.—113 college-student male and female raters evaluated a male or a female civil engineer or custodian on 6 characteristics. Factor analysis identified 3 orthogonal dimensions in these ratings: Rationality, Emotionality, and Likability. Rationality correlated highly with occupational prestige, while Emotionality was uncorrelated with prestige. Likability ratings exposed an interaction between sex of rater and sex of ratee, female raters finding females in these occupations far less likable than males. It is concluded that the sex of an occupational incumbent may have important effects on stereotypical image associated with that individual. (21 ref)—*Journal abstract*.

12611. Talbert, Terry L. et al. (Atlanta Regional Commission, GA) **A study of the police officer height requirement.** *Public Personnel Management*, 1974(Mar-Apr), Vol 3(2), 103-110.—The height of police officers in Atlanta, Georgia, was not related to reports of police brutality or to the number of injuries incurred while on duty. However, assaults on police officers occurred more frequently among officers who are shorter. It is concluded that the height requirements of police officers should be reviewed.

12612. Triandis, Harry C.; Feldman, Jack M.; Weldon, David E. & Harvey, William M. (U Illinois) **Ecosystem distrust and the hard-to-employ.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 44-56.—Conducted a study of samples of blacks and whites, males and females, young and old, hardcore unemployed, and working- and middle-class individuals to investigate "ecosystem distrust." The term is defined as a distrust of people, things, and institutions in one's environment. The components include less trust in people, suspicion of the motives of others, rejection of authority figures and institutions of the establishment, and seeing the environment as malevolent. Consistency was obtained across a heterogeneous set of questions, suggesting the presence of ecosystem distrust among the black hard-core. The implications of these findings for training the hard-to-employ and their supervisors are discussed. (22 ref)—*Journal abstract*.

12613. Tuttle, Thomas C. & Cunningham, J. W. (North Carolina State U, Raleigh) **Affective correlates of systematically-derived work dimensions: Validation of the Occupation Analysis Inventory.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 147.

12614. Vitola, Bart M.; Mullins, Cecil J. & Brokaw, Leland D. (Lackland Air Force Base, Personnel Research Div, TX) **Quality of the all-volunteer Air Force: 1973.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 153-154.

12615. von Haller Gilmer, B. (Carnegie-Mellon U) **Applied psychology: Adjustments in living and work.** (2nd ed). New York, NY: McGraw-Hill, 1975. xii, 448 p. \$11.95.—Presents an introduction to the concepts,

research, and issues in applied psychology, emphasizing personal adjustments of the normal individual. Topics include bases for applying psychology to various aspects of life, individual development and change, career planning, and human aspects of work. (4½ p ref)

12616. Zafiran, S. James. (U Notre Dame) **A developmental model for the occupational socioeconomic status of American men.** *Journal of Vocational Behavior*, 1974(Dec), Vol 5(3), 293-305.—Prior research suggests that psychological, sociological, and economic variables, measuring both differential and developmental dimensions, must be considered for an exhaustive analysis of adult vocational status. From the resulting estimated predictive model, the present study examined occupational socioeconomic status through 17 selected family, ecological, educational, ethnoreligious, and political predictor variables. The data were obtained from a national sample of 1,355 American men. Factor analysis supports the hypothesized existence of an educational-socioeconomic factor and a political identification factor, plus a less discrete religiosity factor. Path analysis confirmed that a respondent's education, adult social class, and father's occupational socioeconomic status were principal predictors of the respondent's occupational socioeconomic status. It is concluded that the main contribution of the present study is not the reconfirmation of findings but rather the merging of the findings into a factor analytic and developmentally sequenced path analysis model. (29 ref)—*Journal abstract*.

12617. Zellinger, David A.; Fromkin, Howard L.; Speller, Donald E. & Kohn, Carol A. (Purdue U, Krannert Graduate School of Industrial Administration) **A commodity theory analysis of the effects of age restrictions upon pornographic materials.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 94-99.—Examined the evaluation of pornographic material as a function of age restrictions and perceived degree of pornographic content. 64 male undergraduates received an experimental booklet containing statements allegedly taken from a book cover. Half of the Ss received an age restriction statement, while the other half did not, and half received a statement saying the book was definitely pornographic, while the other half did not. Results confirm the commodity theory prediction that the imposition of age restrictions upon pornographic materials increases their desirability. Data indicate that the restricted materials were not more valued because of the implication that they were more pornographic than unrestricted materials.—*Journal abstract*.

#### Occupational Guidance & Personnel Selection & Training

12618. Andrews, Hans A. (Kellogg Community Coll) **Beyond the high point code in testing Holland's theory.** *Journal of Vocational Behavior*, 1975(Feb), Vol 6(1), 101-108.—Attempted to test and expand J. L. Holland's (1966) vocational development theory by utilizing more than a single high point code in classification of personality patterns of jobs. 89 male 21-55 yr olds with full-time jobs who were attending a community college were given the Vocational Preference Inventory. Significant positive results were obtained to support Holland's

premise that people search out environments and, hence, vocations that are compatible with their personalities. A more "refined" and/or "subtle" difference was shown in the personality-job relationships when 2 high point codes were used.—*Journal abstract.*

12619. Arvey, Richard D. & Mussio, Stephen J. (U Tennessee) **Determining the existence of unfair test discrimination for female clerical workers.** *Personnel Psychology*, 1973(Win), Vol 26(4), 559-568.—Studied test discrimination against the culturally disadvantaged, using multiple regression techniques. The total sample consisted of 266 predominantly white, female clerical workers. A regression equation using scores on 8 tests as predictors of ratings by supervisors of overall effectiveness yielded a coefficient of .36 for a sample of 168 Ss. 76 advantaged (A) and 74 disadvantaged (DA) Ss were chosen from the total sample on the basis of father's education and of scores on the Environmental Participation Index checklist. While the regression equation constructed from the larger sample predicted rated effectiveness better for A than for DA, it did not systematically under- or overpredict for either group. This finding is attributed to compensatory effects of tests with differential validity for A and DA groups included within the regression equation.—*J. McKillip.*

12620. Austin, David L. (Spin Physics, San Diego, CA) **Career path analysis can aid education and industry.** *Vocational Guidance Quarterly*, 1974(Sep), Vol 23(1), 41-48.—Calls for cooperation between school counselors and industrial personnel workers to identify more clearly industrial career path characteristics, career entry requirements, and relationships to people-data-thing orientations. Recommendations focus on greater understanding of information-processing skills, commonality of requirements, and mutual inspection needs among counselors, students, and personnel workers.

12621. Baker, Larry D.; DiMarco, Nicholas & Scott, W. E. (U Missouri, St Louis) **Effects of supervisors' sex and level of authoritarianism on evaluation and reinforcement of blind and sighted workers.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 28-32.—Describes an experiment with 60 male and 60 female undergraduates selected on the basis of their scores on the Forced-Choice F scale (N. Berkowitz and G. Wolkon, 1964). Use of a factorial design, with authoritarianism and sex of Ss and vision of workers as the factors, revealed that blind workers were rewarded significantly more than sighted workers for identical performance and that no significant main effects occurred for level of authoritarianism and sex. No significant 2- or 3-way interactions were found. Although sex and level of authoritarianism affected attitudes toward the blind, they did not appear to affect reinforcement behavior. (18 ref)—*Journal abstract.*

12622. Baxter, Brent. (American Inst for Research, Pittsburgh, PA) **Review of selected federal and professional positions on the use of tests in employment.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 143.

12623. Birk, Janice M. (U Maryland) **Interest inventories: A mixed blessing.** *Vocational Guidance Quarterly*, 1974(Jun), Vol 22(4), 280-286.—Selectively reviews studies and position papers dealing with sex role

bias in using interest inventories with women. Bias against females has appeared not only in patterns of interest constructed for women into inventories as opposed to those constructed for men, especially in the Strong Vocational Interest Blank, but also in guidelines issued to counselors for interpreting patterns. In addition, stereotypes held by both counselors and clients have limited the occupations females are encouraged to consider. To correct these problems, inventories should offer the full range of occupations to both sexes, and females should be encouraged to choose from the whole range. (30 ref)—*C. A. Heikkinen.*

12624. Crites, John O. (U Maryland) **A reappraisal of vocational appraisal.** *Vocational Guidance Quarterly*, 1974(Jun), Vol 22(4), 272-279.—Reconceptualizes vocational appraisal, based on a synthesis of major approaches to career counseling, making it an organic, continuous part of career counseling and casting it into the context of theory and research. The appraisal becomes a collaboration between counselor and client which (a) yields person and problem appraisals, (b) distinguishes between the content and process of career decision making, (c) recognizes the efficacy of communicating test results in response to the client's thinking and talking about career choice, (d) furthers the client's present and future career development through active counselor intervention, and (e) applies principles of behavior modification as the *modus operandi*. (36 ref)—*C. A. Heikkinen.*

12628. Dipboye, Robert L.; Fromkin, Howard L. & Wiback, Kent. (U Tennessee) **Relative importance of applicant sex, attractiveness, and scholastic standing in evaluation of job applicant résumés.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 39-43.—30 college students and 30 professional interviewers rated and ranked bogus résumés on suitability for a managerial position. Applicant sex, physical attractiveness, and scholastic standing were systematically varied in the résumés. A  $2 \times 2 \times 2 \times 3$  repeated measures analysis of variance on the ratings yielded 4 significant main effects ( $p < .05$ ), while the same analysis on the rankings yielded 3 significant main effects ( $p < .01$ ). Students rated applicants more favorably than professionals. Both groups preferred males to females, attractive applicants to unattractive applicants, and applicants of high scholastic standing. The latter variable accounted for the greatest proportion of variance. However, internal analyses of the rankings reveal that sex and physical attractiveness were more important than indi-

cated by the analysis of variance. (15 ref)—*Journal abstract*.

12630. Dubin, Samuel S. (Pennsylvania State U) **Updating and midcareer development and change.** *Vocational Guidance Quarterly*, 1974(Dec), Vol 23(2), 152-158.—Addresses the need for professionals at midcareer to keep up to date if their learning is to remain applicable. Due largely to rapid discovery of new knowledge and changes in personal and organizational objectives, knowledge becomes obsolete earlier than before, often by midcareer. Both psychological and organizational variables are critical to the updating process. These include (a) motivational factors related to perceived rewards, (b) organizational climate encouraging updating, (c) supervision fostering further development, (d) challenging problem-solving tasks, (e) colleague interactions, and (f) management philosophy requiring employee updating. (20 ref)—C. A. Heikkinen.

Sherwood (Eds), *Integrating the organization: A social psychological analysis*. New York, NY: Free Press, 1974. xxiv, 370 p. \$14.95.

12632. Edelstein, Robert M. & Rao, Vithala R. (Ben Gurion U of the Negev, Beersheva, Israel) **Subjective evaluations of employer attributes by administration students.** *Journal of Vocational Behavior*, 1975(Feb), Vol 6(1), 109-120.—In an application of the conjoint measurement methodology, an exploratory study was conducted of the trade-off relationships among 4 organizational attributes—dynamism, societal concern, functional-administrative emphasis, and relative size—as they relate to the selection of an employer by students of administration. Preference ranks of 36 employer concepts obtained from 86 graduate students of business, public, and hospital administration were analyzed according to the additive conjoint measurement model, yielding implicit rank-ordering of the 4 organizational attributes as choice criteria. Irrespective of the program of study, dynamism and societal concern emerged as the most important determinants in employer selection, but differences existed among programs, year of study, and explicitly vs implicitly elicited weights.—*Journal abstract*.

12633. Edwards, Agnes M. & Whitcraft, Carol J. (U Texas, School of Social Work, Austin) **Vocational service agencies and the disadvantaged.** *Vocational Guidance Quarterly*, 1974(Sep), Vol 23(1), 49-53.—Examined knowledge of, attitudes toward, and contacts with 4 vocational service programs—Manpower, vocational rehabilitation, Job Corps, and Youth Corps—among 512 households in a black, low-income urban community. Black interviewers collected data using a structured interview; several reliability checks were structured into the interviewing procedure. Results show that households possessed "good" information about only 1 agency, Manpower, and that households above the

Office of Economic Opportunity poverty level had significantly ( $p < .02$ ) greater knowledge of all agencies than those below. Most of the respondents expressed positive attitudes toward all agencies, vocational rehabilitation receiving the most positive ratings. Fewer than 10% of the households reported actual contact with any of the agencies. Findings suggest that none of the agencies is effective in reaching the people who need its services. Recommendations include improving communication with the disadvantaged community and involving it more in the work of the agencies.—C. A. Heikkinen.

12640. Ghiselli, Edwin E. (U California, Berkeley) **The validity of aptitude tests in personnel selection.** *Person-*

*nel Psychology*, 1973(Win), Vol 26(4), 461-477.—Summarizes information on criterion-related validities for 20 categories of personnel selection tests published 1920-1971 for 21 occupational categories. Mean validity coefficients, weighted by number of cases, were computed for prediction of training (predictive validity) and job proficiency (concurrent validity). For all tests combined, predictive validity (.39) was better than concurrent validity (.22). Predictive validity was greatest for tests of intellectual abilities (for managerial, clerical, protective, service, and industrial occupations, and for trades and crafts), and to a lesser extent for tests of spatial and mechanical abilities (managerial and industrial occupations, vehicle operators, and trades and crafts). Concurrent validity was greatest for tests of intellectual abilities (managerial, clerical, and service occupations, trades and crafts, and salesmen but not sales clerks), for personality tests (sales and industrial occupations, vehicle operators, and trades and crafts), and for tests of perceptual accuracy (managerial, clerical, and industrial occupations, and trades and crafts).—*J. McKillip*.

12648. **Hohenshil, Thomas H.** (Virginia Polytechnic Inst & State U) **Inventoried vocational interests of vocational counselors.** *Vocational Guidance Quarterly*, 1974(Sep), Vol 23(1), 24-27.—Examined interests of 75 Ohio public school vocational counselors using the Kuder Occupational Interest Survey. As expected, results showed Ss' highest interests in helping relationships and people-contact areas, and lowest in data- and thing-oriented areas.

12649. **Johnson, Richard W. & Campbell, David P.** (U Wisconsin, Counseling Ctr, Madison) **Basic interests of men in 62 occupations.** *Journal of Vocational Behavior*, 1974(Dec), Vol 5(3), 373-380.—Used the 22 basic interest categories on the Strong Vocational Interest Blank for Men to classify the interests of men in 62 occupations. The number of basic items which differentiated the interests of men in the occupation from men-in-general was divided by the total number of basic items for each category. These percentages were then ranked in descending order so that the relative importance of different types of interests for various occupations could be easily determined. Results show that at least 9 categories were required to describe adequately the interests of most occupational groups. It is concluded from this finding and other data that individuals need to consider a variety of interest factors in determining their educational and vocational plans.—*Journal abstract*.

12650. **Joyce, Reid P. & Chenzoff, Andrew P.** (Applied Science Assoc, Valencia, PA) **Improving job performance aids through condensation, dual-level presentation, promotion of learning, and entry by malfunction symptoms.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 159-160.

12651. **Katz, Arnold.** (U Pittsburgh) **Schooling, age, and length of unemployment.** *Industrial & Labor Relations Review*, 1974(Jul), Vol 27(4), 597-605.—Examined the role of schooling in the unemployment of older workers. Findings indicate that the loss of the initial advantages of schooling accounts for a considerable part of the lengthening of the unemployment period characteristic of the older segments of the labor force.

12652. **Lunneborg, Patricia W.** (U Washington) **Can college graduates in psychology find employment in their field?** *Vocational Guidance Quarterly*, 1974(Dec), Vol 23(2), 159-166.—Studied 424 baccalaureate psychology graduates from the University of Washington, 1969-1972, whose program was vocationally rather than academically oriented, to determine success in finding employment in psychology. Data were available primarily from a postcard survey in spring 1973, which had a

74% response. Coded responses were subjected to chi-square analyses. 67% were working full- or part-time, mainly in education and business; 22% were in school; and 11% were unemployed (these percentages were better than those for psychology graduates nationwide); 25% were in jobs directly related to psychology. Supplementing psychology courses with courses in another area was significantly ( $p < .01$ ) related to employment status, while grade point averages and psychology grades were unrelated to employment. 16% of the respondents said that job finding difficulties were related to their degree program. Employed graduates were significantly ( $p < .001$ ) more satisfied with their degree work than the unemployed.—C. A. Heikkinen.

12653. Magee, Richard H. (Booz, Allen & Hamilton, Chicago, IL.) **How to sell a career opportunity.** *Personnel Journal*, 1974(Aug), Vol 53(8), 583-588.—Describes employment interviewing procedures helpful in persuading an applicant to accept a job offer. The psychology of persuasion and selling techniques are discussed.

(Xerox Corp, Rochester, NY) **A new concept in personnel development and employee relations.** *Personnel Journal*, 1974(Aug), Vol 53(8), 606-611.—Discusses traditional occupational psychology and argues that personnel development should embrace and unite selection, assessment, career guidance, training and continuing education, utilization of skill inventories, career ladders, transfers, and placement.

12662. Morano, Richard. (Xerox Corp, Rochester, NY) **Determining organizational training needs.** *Personnel Psychology*, 1973(Win), Vol 26(4), 479-487.—Discusses 3 methods of assessing needs for specific remedial training of current work force: (a) survey both of managers of functional groups and of candidates for training; (b) manpower analysis of technical obsolescence; and (c) organizational analysis focusing on product conception and development.

12663. Nafziger, Dean H.; Holland, John L.; Helms, Samuel T. & McPartland, James M. (Johns Hopkins U) **Applying an occupational classification to the work histories of young men and women.** *Journal of Vocational Behavior*, 1974(Dec), Vol 5(3), 331-345.—Used J. L. Holland's occupational classification to analyze the work histories of a national representative sample of 5,000 men and 5,000 women aged 14-24 yrs. Hypotheses tested were concerned with the psychological orderliness of occupational changes, the relationship between occupational experiences and aspirations, and the relationship between consistent occupational codes and the stability of work histories. Analyses support the usefulness of the occupational classification for organizing the work histories of both young men and young women. For both sexes, the classification reflected regular patterns of job changes. The category of a person's earlier job was an efficient predictor of a person's subsequent jobs; likewise, the category of a person's current job forecasted the category of his vocational aspiration. The consistency of an occupational code was also related to job stability for whites but not for blacks. (27 ref)—*Journal abstract.*

12664. Nordberg, Robert B. (Marquette U, School of Education) **Meditation: Future vehicle for career exploration.** *Vocational Guidance Quarterly*, 1974(Jun), Vol 22(4), 267-271.—Recommends meditation and other forms of mysticism as a means of career exploration through heightened self-understanding, and as a balance to the findings of the objective scientific approach. The methods and circumstances of meditation for this purpose depend largely on the choice between naturalistic and supernaturalistic approaches to mystical knowledge.

12665. Odell, Charles E.; Pritchard, David H. & Sinick, Daniel. (Bureau of Employment Security, Harrisburg, PA) **Whose job is job placement?** *Vocational Guidance Quarterly*, 1974(Dec), Vol 23(2), 138-145. —Discusses who is responsible for job placement in the transition from secondary school to work. It is suggested that greater cooperation is needed among individual schools' placement services and outside resources such as the community, the employment service, and the US Office of Education. Program development should stress establishment of goals and objectives, follow-up and critical feedback, evaluation, and redesign. Ideally, the placement process both puts individuals into growth-fostering situations and follows through so that the individual has help available even after leaving school, including help in moving from work to school.—C. A. Heikkinen.

12666. Olmstead, Joseph A.; Cleary, Fred K.; Lackey, Larry & Salter, James A. (Human Resources Research Organization, Alexandria, VA) **Development of leadership assessment simulations.** *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 212.

12667. Parsons, George E. & Wigtil, James V. (U Cincinnati) **Occupational mobility as measured by Holland's theory of career selection.** *Journal of Vocational Behavior*, 1974(Dec), Vol 5(3), 321-330.—Examined the occupational mobility of men aged 45-59 yrs as measured by J. L. Holland's (1966) theory of career selection and its relationship to men in the work force. Ss were a total of 5,030 black and white US men in 235 sample areas comprising 485 counties and independent cities, representing every state and the District of Columbia. Stability was discussed in 2 distinct ways, within a job and in the kind of work a man does over a career. In his research, Holland concluded that Realistic and Investigative personality types would change personality type less often and have more stable job choices in comparison to other personality types. Results of this study support these findings to some extent. However, it is concluded that stability in a personality type was strongly influenced by the number of jobs available in a particular personality type and the structure of the labor market demand. Results also show that psychological concepts seem to be more important in changing jobs than in selecting initial jobs.—*Journal abstract*.

12668. Pilato, Guy T. & Myers, Roger A. (Pennsylvania State U, Ritenour Health Ctr) **The effects of computer-mediated vocational guidance procedures on the appropriateness of vocational preference.** *Journal of Vocational Behavior*, 1975(Feb), Vol 6(1), 61-72.—To assess the effectiveness of vocational guidance procedures proposed for inclusion in a computer-based vocational exploration system, 139 11th-grade males were randomly assigned to 3 experimental groups and a control group. Group 1 was given a computer-generated accuracy of self-knowledge feedback; Group 2 was taught an occupational classification scheme, and Group 3 experienced both. Utilizing a method of explicit comparison between Ss' measured characteristics and the measured characteristics of occupational norm groups, results show Ss in the groups receiving feedback increased in the appropriateness of the occupational level of their 1st occupational choice. In addition, Ss in

the combined treatment group increased in the appropriateness of the level of their total occupational preferences. A delayed posttest indicated that these increases persisted. (29 ref)—*Journal abstract*.

12669. Plata, Maximino. (U Texas, Special Education, El Paso) **Stability and change in the prestige rankings of occupations over 49 years.** *Journal of Vocational Behavior*, 1975(Feb), Vol 6(1), 95-99.—Review indicates that the social status of occupations has remained stable over a 49-yr period beginning with G. S. Counts's 1925 study that found occupations in a well-defined, prestige order. This prestige hierarchy has obtained throughout several replicated studies, some of which controlled the variables of race, educational level, and sex. Results of the present replication study with 117 Anglo- and 129 Mexican-American young adults (mostly college students) also support this prestige hierarchy. It is concluded that the prestige level of occupations have withstood the test of time, including World War II and even sociological and educational changes.—*Journal abstract*.

12674. Schweitzer, Stuart O. & Smith, Ralph E. (Georgetown U) **The persistence of the discouraged worker effect.** *Industrial & Labor Relations Review*, 1974(Jan), Vol 27(2), 249-260.—Discusses the hypothesis that the experience of an unsuccessful job search increases the propensity to withdraw from the labor force—the discouraged worker effect. Almost 3% of the labor force is estimated to withdraw during periods of high unemployment. The literature on labor force participation is reviewed, and a preliminary labor participation model is developed based on a 1966-1968 longitudinal survey of male youths. A worker's decision to remain in the labor force is considered influenced by his perceived chance of satisfaction from remaining and determined by his past experiences with unemployment. Evidence indicates the discouraged worker effect has a significant dynamic component, implying that the psychological impact of unemployment persists over time.—R. Tomasko.

12675. Siegel, Arthur L.; Federman, Philip J. & Sellman, Wayne S. (Applied Psychological Services, Wayne, PA) **A survey of student measurement and**

course evaluation procedures within the Air Training Command. *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 206.

12676. Sinalko, H. Wallace; Guthrie, George M. & Abbot, Preston S. (Inst for Defense Analyses, Arlington, VA) Training Vietnamese to operate and maintain complex military equipment. *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 160.

12677. Singer, Jack N. (Colorado State U) Sex differences-similarities in job preference factors. *Journal of Vocational Behavior*, 1974(Dec), Vol 5(3), 357-365. —Investigated sex differences in preferences for various job factors which college students consider important in their job selection decisions. Ss were 55 female and 75 male undergraduates. Results show that while college students had strong differences in their preferences, these differences were not stereotypically male or female. Overall, both males and females were primarily looking for jobs in which they could learn, accomplish something worthwhile, and work with congenial people. Furthermore, the extent to which a company demonstrated broad social concern was not among the important criteria used by students when making their decisions. (24 ref)—*Journal abstract*.

12678. Torres, Felipe T. Vocational/technical education and the changing Philippine society: A value approach. *St. Louis University Research Journal*, 1973(Jun), Vol 4(2), 227-239. —Describes the Philippine educational system and its ensuing manpower needs. Suggestions and recommendations are made for developing an approach so that the educational system will produce the types of workers needed by the manpower system.

12679. Turner, Barbara F. & McCaffrey, Joanne H. (U Massachusetts, School of Education, Amherst) Socialization and career orientation among black and white college women. *Journal of Vocational Behavior*, 1974(Dec), Vol 5(3), 307-319. —Compared (a) patterns of career preferences and career expectations among black and white college women and (b) developmental antecedents of career expectation among these women. Ss were 28 black and 45 white freshmen at a large state university. Support was found for hypotheses derived from postulates of J. B. Rotter's (1954) social learning theory. Compared to whites, blacks (a) were less likely to expect the level of work involvement preferred, (b) expected more employment, and (c) were more likely to prefer less employment than they realistically expected. Antecedents of career expectation were categorized as internal, external, or neutral. As hypothesized, variables expressive of external control predicted level of career expectation among blacks, whereas variables expressive of internal control predicted high career expectations among whites.—*Journal abstract*.

12680. Turner, Robert G. & Horn, Joseph M. (U Texas, Austin) Standard psychological test responses of a group of Mexican-Americans. *Catalog of Selected Documents in Psychology*, 1975(Win), Vol 5, 210.

12681. Waldron, L. A. (Public Service Board, Barton, ACT, Australia) The validity of an employment interview independent of psychometric variables. *Australian Psychologist*, 1974(Mar), Vol 9(1), 68-77. —Reports on interviews with 118 candidates for the Royal Australian

Navy conducted by 9 psychologists. Interviewers were required to make a prediction, rating, or decision about candidates' all-around success before the interview on the basis of available test and biographical information. After the interview they also assessed motivation to enlist and ability to adjust to the naval environment. The Ss' mean age was 18 yrs 5 mo and mean IQ was 103.05. The final global prediction of success in the Navy did not significantly increase the validity of predicting success based on 4 tests and a life history. Interviewers were successful to a significant degree ( $p < .05$ ) in predicting supervisors' ratings after 9 mo of service. Motivation and social adjustment appeared to offer most scope for valid interviews. Prediction of training results based on intelligence tests was stronger and more cost-effective than predictions based on interviews. (15 ref)—*J. C. Figurelli*.

12682. Webb, Sam C. (Georgia Inst of Technology) Transferability of a role-oriented interest inventory from men to women in church-related occupations. *Journal of Vocational Behavior*, 1974(Dec), Vol 5(3), 347-356. —Examined the feasibility of using the Inventory of Religious Activities of Interests (IRAI) and the extensive data for men associated with the IRAI in the counseling of women who may be interested in entering occupations related to the Protestant Church. Ss were 670 women and 3,618 men (mean age = 43.3 yrs) employed in a variety of church-related occupations. Mean scores on the 10 scales of the IRAI for men and women in 9 categories of church-related occupations and for the total sex groups were compared with respect to similarity of shape of mean score profile and with respect to the level of mean scores. In addition, the ability of the IRAI to differentiate among groups (11 for women, 10 for men) for the sexes separately was considered. Results suggest that while men and women as total groups appear to differ in their interests as measured by the IRAI, the data for men and women in the respective specialties are sufficiently similar in respect to profile shape and mean score level to justify the use of the IRAI and the normative data for men in the counseling of women. Results suggest the IRAI differentiates among subgroups of men more effectively than it does among subgroups of women; but there are data to suggest that this difference may be more apparent than real.—*Journal abstract*.

### Job Performance & Satisfaction

12684. Alutto, Joseph A. & Belasco, James A. (State U New York, Buffalo) Determinants of attitudinal militancy among nurses and teachers. *Industrial & Labor Relations Review*, 1974(Jan), Vol 27(2), 216-227. —Tested the hypothesis that intra- and intergroup variations in militancy may be associated with the nature of both the profession and the employing institution. A questionnaire was administered to 414 teachers employed in 2 school districts and 482 registered nurses employed in 3 general hospitals. Results indicate that age is an

important discriminator of attitudinal militancy and confirm the 2 contributing factors suggested in the hypothesis. Job autonomy, participation in decision making, salary, and conditions of professional practice appear most likely to influence the level of attitudinal militancy. Results suggest the need for employing organizations to provide a differentiated professional hierarchy that permits several steps of advancement for practicing professionals. (22 ref)—*R. Tomasko.*

12686. **Broedling, Laurie A.** (US Navy Personnel Research & Development Ctr, San Diego, CA.) **Relationship of internal-external control to work motivation and performance in an expectancy model.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 65-70.—Conducted a study of 80 officer and 127 enlisted Naval personnel to investigate the hypotheses that internality (perception of much control) is positively related to (a) the concept of instrumentality from expectancy theory, (b) work motivation as measured by ratings and by expectancy theory measures, (c) job performance as measured by ratings, and (d) rank. These hypotheses were confirmed at or beyond the .05 significance level. A multitrait-multirater matrix showed convergent but no discriminant validity for ratings by supervisors, peers, and the Ss themselves on the Ss' job effort and performance.—*Journal abstract.*

12687. **Bulák, Jozef.** [Interpersonal relationships and work behavior in small work groups.] (Slovak) *Syntéza*, 1972(Nov), Vol 5(4), 132-139.—Conducted a correlational study of work motivation of 200 construction workers working in 32 teams. Team efficiency, acceptance of management objectives, average hourly earnings, satisfaction with rewards, and satisfaction with work were positively related to group solidarity, interpersonal confidence, and the social status of the group leader. Team efficiency and acceptance of management objectives correlated significantly with group leader's work status. The group's response to underproductive group members, in the form of frustration and resignation, correlated negatively with work variables, while punitive response correlated positively and more widely. Group solidarity was significantly related to initiating structure and to group centeredness. Defending group interests against management negated the group's confidence in the equity of compensation. Recommendations for small group leadership are presented. (English, Russian, French & German summaries)—*P. Babarik.*

12688. **Bulák, Jozef.** [Turnover and absenteeism as an expression of work motivation.] (Slovak) *Syntéza*, 1972(Feb), Vol 5(1), 1-9.—Studied the social and material reward factors affecting turnover and absenteeism among 173 Slovak building construction workers. A questionnaire was administered covering satisfaction with compensation, the interest of the job, future prospects, and interpersonal relationships. Responses were correlated with absenteeism, and with intention to leave the job or remain, for workers classified as efficient and inefficient. Significantly correlated with permanence

were good on-the-job reputation, recognition of one's work, fair treatment, confidence in team achievement, team spirit, satisfaction with net compensation, and satisfaction with work organization. In general these relations were strong, or held, only for the efficient workers. For absenteeism chi-square relationships were similar except that confidence in one's team characterized efficient workers and the reverse characterized absentees ( $p < .05$ ). In addition, absentees showed less motivation to group solidarity. (English, French, & Russian summaries)—*P. Babarik.*

12689. **Cummings, L. L.** (U Wisconsin, Graduate School of Business, Madison) **A field experimental study of the effects of two performance appraisal systems.** *Personnel Psychology*, 1973(Win), Vol 26(4), 489-502.—Studied employee evaluations of 2 appraisal systems, the "old" system which centralized power in 2nd-level supervisor, provided for no feedback on appraisal, and did not allow for employee input regarding technology of appraisal, and the "new" system which centralized power in 1st-level supervisor and provided for feedback on appraisal and input into technology of appraisal. A pre- and posttest, group comparison design was utilized in which 140 female operative employees from 8 work groups evaluated the old appraisal system and the linkage between the system and their pay on 3 semantic differential scales: evaluation, sensitivity, and clarity. After this evaluation the new appraisal system was introduced to 4 groups, who became more positive on all scales at posttest than the 4 groups remaining under the old appraisal system. (38 ref)—*J. McKillip.*

12690. **Darmon, René Y.** (U Laval, Québec, Québec, Canada) **Salesmen's response to financial incentives: An empirical study.** *Journal of Marketing Research*, 1974(Nov), Vol 11(4), 418-426.—Hypothesized that different behavioral patterns explain salesmen's responses, in terms of their sales and earnings, to financial incentives. The suggestion that salesmen work just enough to attain what they consider an acceptable level of income was supported. (22 ref)

12691. **Desai, K. G.** (Tata Inst of Social Sciences, Bombay, India) **Absenteeism: A problem solving approach.** *Indian Journal of Social Work*, 1974(Jul), Vol 35(2), 149-154.—In general, 3 factors contribute to absenteeism: the social-cultural background of the employees, job-related problems, and personal difficulties. A description of these factors and an outline for conducting a systematic study are given. It is concluded that absenteeism cannot be fully eradicated, and that its specific causes are unique from 1 organization to another.

12693. **Hall, Douglas T.** (Michigan State U) **Pressures from work, self, and home in the life stages of married women.** *Journal of Vocational Behavior*, 1975(Feb), Vol 6(1), 121-132.—Following H. A. Lopata's (see PA, Vol 41:506) model of the life cycle of the married woman's role, it was predicted that a woman's life stage would be related to her role pressures (work, home, self, and time).

conflict, and satisfaction. Results of a mailed questionnaire returned by 229 women who graduated from college between 1948 and 1968 confirm the prediction. Age and number of roles were not as strongly related to these variables as was life stage. Work activities and pressures declined through the peak child-rearing stage and then increased for women with older children, while pressures from home generally rose throughout the life cycle. The differential impact of various sources of conflict in different life stages is reported, and forms of organizational career support oriented toward particular life stages are suggested. (19 ref)—*Journal abstract.*

12694. Horvat, Milan. [Theoretical and practical aspects of motivation in Slovenian industry.] (Slo) *Anthropos*, 1972, No 3-4, 37-50.—Evaluates the practical value of some contemporary theories of motivation for industrial applications in the context of the current workers' self-management system in Slovenia. The approaches suggested by A. H. Maslow, F. Herzberg, and V. H. Vroom are seen as having limited applicability to the socialist system. Several studies performed in Slovenian factories indicated that the most important motivational factors were personal income, work satisfaction, recognition for achievement, interesting work, possibilities of improvement, working conditions, and safety. The most demotivating factors were injustice in the distribution of income, underestimation of workers' abilities, dangerous work, and poor organization. Data on the opposition of a few workers to technological innovation are presented and reasons for such attitudes are discussed.—*S. Slak.*

12695. Johnson, Paul O. & Bledsoe, Joseph C. (Auburn U) *Morale as related to perceptions of leader behavior.* *Personnel Psychology*, 1973(Win), Vol 26(4), 581-592.—Studied the relationship of the morale of 197 Georgia Cooperative Extension agents to their perceptions of their immediate supervisors. Morale was assessed by a revised version of the Purdue Teacher Opinionnaire, and supervisor characteristics of consideration and initiating structure were assessed by the Leader Behavior Description Questionnaire. Agents' morale was correlated with both supervisor characteristics but consideration was almost as good a predictor of morale (.65) as a combination of both consideration and initiating structure (.66). White agents had significantly higher morale than did black agents, and agents with greater length of service had higher morale than those with less tenure. The greater importance of consideration than of initiating structure for agents' morale is discussed. (16 ref)—*J. McKillip.*

Sherwood (Eds), *Integrating the organization: A social psychological analysis.* New York, NY: Free Press, 1974. xxiv, 370 p. \$14.95.

12697. Kenny, Martin T. *Public employee attitudes toward the four-day work week.* *Public Personnel Management*, 1974(Mar-Apr), Vol 3(2), 159-161.—Analyzed 1,744 replies to a questionnaire sent to employees of Oregon. If the extra day off is Monday or Friday, respondents favored the 4-day, 10 hrs/day plan by 68%. If the extra day was not Monday or Friday then only

24% favored the idea. A consistent minority was opposed to the plan.

12698. Kollárik, Teodor. [Workers' dissatisfaction as a reason for employee turnover.] (Slovak) *Syntéza*, 1973(Feb), Vol 6(1), 22-25.—Describes a correlational study relating worker dissatisfaction to turnover as the equivalent of the flight reaction to frustration. Data were obtained from 1,595 chemical factory employees concerning their satisfaction with their jobs, their proneness to quit, and their actual quitting rates. When the 215 most dissatisfied workers were compared with the 215 most satisfied workers on plans, thoughts, and desire to quit, there were significantly greater rates of intention to quit for the most dissatisfied. Worker dissatisfaction was significantly greater than satisfaction in workers less than 30 yrs old. After age 40, satisfaction exceeded dissatisfaction. The proportion of dissatisfied workers was closely correlated with turnover throughout the life cycle, being high below age 30 and low after age 40. (Russian, English, French, & German summaries)—*P. Babarik.*

12699. Latham, Gary P. & Baldes, J. James. (Weyerhaeuser Co, Human Resource Research, Tacoma, WA) *The "practical significance" of Locke's theory of goal setting.* *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 122-124.—Assessed the practical significance of E. Locke's theory (see PA, Vol 42:11263) of goal setting, using a time series design. Data were collected on the net weight of 36 logging trucks in 6 logging operations for 12 consecutive months. Results show that performance improved immediately upon the assignment of a specific hard goal. Company cost accounting procedures indicated that this same increase in performance without goal setting would have required an expenditure of a quarter of a million dollars on the purchase of additional trucks alone.—*Journal abstract.*

12700. Mangione, Thomas W. & Quinn, Robert P. (U Massachusetts, Boston) *Job satisfaction, counterproductive behavior, and drug use at work.* *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 114-116.—Conducted a study of 1,327 wage and salaried workers to determine whether the ecologically based inference that counterproductive behavior and drug use at work are symptoms of job dissatisfaction. There was a significant association between job satisfaction and self-reports of counterproductive behavior only among men 30 yrs old or older. Similar results were found for drug use at work.—*Journal abstract.*

12702. Reynolds, Michael. (Durham U, Business School, England) *Perceptual defence and Herzberg's methodology: A basis for understanding commitment to work.* *Interpersonal Development*, 1973-1974, Vol 4(3), 170-176.—Considers that one of the most influential explanations of motivation to work has been F. Herzberg's (1959, 1968) motivator-hygiene theory. Using a critical incident technique he demonstrated that satisfaction and dissatisfaction were associated with 2 distinct sets of job factors. The validity of this theory has been

questioned. As the method involves recall, the pattern of responses is as likely to be a manifestation of some defensive process, as a true indication of motivational disposition. Account is taken in the present article of earlier studies on the effect of ego-involvement on recall. It is proposed that the perceptual defense illustrated by Herzberg's studies can provide the basis for an alternative explanation of commitment to work. (24 ref)

12703. **Ronan, W. W. & Organt, G. J.** (Georgia Inst of Technology) **Determinants of pay and pay satisfaction.** *Personnel Psychology*, 1973(Win), Vol 26(4), 503-520. —Administered a questionnaire to 8,894 employees of a single company (34.2% usable returns). Sex, age, tenure, job level, and level of education were used as predictors of actual salary in multiple regression analysis. These factors plus actual salary were similarly used as predictors of satisfaction with pay. Analyses were computed separately for management and supervisory personnel, salaried nonsupervisory personnel, and hourly personnel. Coefficients of multiple determination for actual salary were .64, .41, and .20 for the 3 employee groups, respectively. Best predictors were education, job level, and age for management personnel; age, education, and job level for salaried workers; and tenure for hourly workers. Generally, the only predictor of satisfaction with pay was actual salary, although the correlation was low in all cases. Women hourly employees were paid significantly less than male hourly employees but were better satisfied with this pay. The lack of relationship between the predictors of actual salary and the predictors of satisfaction with pay is discussed with regard to rewarding and motivational aspects of pay. (51 ref)

12704. **Shapiro, H. Jack & Wahba, Mahmoud A.** (Iona Coll, Graduate Business School) **Frederick W. Taylor: 62 years later.** *Personnel Journal*, 1974(Aug), Vol 53(8), 574-578. —Studied job satisfaction, as measured by the Job Description Index, in 75 employees of a steel products manufacturer. Results indicate that Taylor's concept of money as a prime motivator of human efforts is still a viable hypothesis; it is concluded that these employees were not highly motivated by social, self-esteem, or self-actualization work-associated needs.—*P. L. Crawford.*

12705. **Shepard, Winifred O. & Hess, David T.** (State University Coll New York, Fredonia) **Attitudes in four age groups toward sex role division in adult occupations and activities.** *Journal of Vocational Behavior*, 1975(Feb), Vol 6(1), 27-39. —Presented a list of 43 adult occupations to equal numbers of males and females in the following groups: 60 kindergartners, 68 8th graders, 86 college students, and 54 adults. Ss indicated whether each occupation should be performed by a male, female, or either. Liberality, defined in terms of the number of "either" responses, increased markedly from kindergarten to 8th grade through college and then showed a moderate decrease in the adult sample. In each age group except kindergarten there was a significant sex difference, with females being more liberal. Analysis of individual roles showed that both sexes were willing to let women into prestige occupations but females were more willing than males to have household and child-

caring tasks performed by both sexes. (18 ref)—*Journal abstract.*

12706. **Sheridan, John E.; Slocum, John W. & Min, Byung.** (Wayne State U, Coll of Business Administration) **Motivational determinants of job performance.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 119-121. —Studied V. Vroom's expectancy theory model in relation to work performance. 138 incentive workers employed in a steel fabricating plant participated in the study. The data indicate that the total expectancy model is a valid indicator of job performance, although the variances explained by the various parts of the theory were low. Several operational problems in defining the basic measures used in testing Vroom's theory are discussed.—*Journal abstract.*

12707. **Smith, Elsie J.** (State U New York, Buffalo) **Profile of the black individual in vocational literature.** *Journal of Vocational Behavior*, 1975(Feb), Vol 6(1), 41-59. —Contends that, presently, research on the vocational development of black individuals—both adolescents and adults—constitutes a disparate body of knowledge. The present article examines the "state of the art" in this field, gathers together some of the diverse research strands symbolizing it, and presents, on the basis of the research reviewed, a profile of the black individual in vocational literature. It is suggested that the unification of reference group theory with vocational theories may potentially prove helpful in closing many of the gaps that currently exist concerning the psychology of the black's vocational development. (66 ref)—*Journal abstract.*

12708. **Stone, Eugene F. & Porter, Lyman W.** (Oakland U, School of Economics & Management) **Job characteristics and job attitudes: A multivariate study.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 57-64. —Obtained attitude data from 556 employees in a western telephone company. Respondents held 1 of 16 "craft" jobs in the department selected for study. Multiple discriminant function analysis was performed using 16 groups formed on the basis of Ss' job titles. Variables used in this primary analysis included job satisfaction, organizational commitment, motivational force, and sources of organizational attachment. Discriminatory power for the 16 group solution was .53. A secondary analysis was performed in which discriminant function means were related to means of jobs on several job characteristics variables. Viewed jointly these 2 analyses suggest that the relatively high discriminatory power achieved in the primary analysis may have been a function of job scope-job attitude relationship demonstrated in the secondary analysis.—*Journal abstract.*

12709. **Tracy, Lane.** (Ohio U) **The influence of noneconomic factors on negotiators.** *Industrial & Labor Relations Review*, 1974(Jan), Vol 27(2), 204-215. —Administered a questionnaire to 147 members of management and union negotiating teams engaged in 25 separate contract negotiations between July 1970 and February 1971. The effects of noneconomic factors on the attitudes of the Ss were measured using 72 scaled questions about Ss' attitudes toward satisfaction with the resulting contract, satisfaction with working relationship between the parties, and personal inclination to settle for the resulting contract. The specific factors measured

were drawn from the theoretical work of F. Herzberg, R. Walton, L. Festinger, and J. Adams. Results indicate that the settlement inclinations of the Ss were directly related to perceived equitability of the contract, perceived achievement, nature of the work itself, favorable recognition from teammates, and interpersonal relationships among the teammates. (15 ref)—*R. Tomasko.*

12710. Tuttle, Thomas C. & Hazel, Joe T. (Lackland Air Force Base, Occupational Research Div, TX) **Review and implications of job satisfaction and work motivation theories for Air Force research.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 149-150.

12711. Walls, Richard T. & Gulkus, Steven P. (West Virginia U, Coll of Human Resources & Education, Research & Training Ctr) **Reinforcers and vocational maturity in occupational aspiration, expectation, and goal deflection.** *Journal of Vocational Behavior*, 1974(Dec), Vol 5(3), 381-390.—Notes that when vocational aspirations and expectations are not the same, this difference is termed occupational goal deflection. The present study investigated the notion that such aspirations, expectations, and goal deflection are related to an individual's vocational maturity, education, and job reinforcers. Ss were 149 vocational rehabilitation clients (mean age = 25 yrs) and 51 graduate students (mean age = 29 yrs). Analyses of variance indicate that more vocationally mature Ss tended to display greater vocational aspiration, greater vocational expectation, and less goal deflection. Similarly, Ss who valued such job characteristics as "getting a feeling of accomplishment, fair company policies, trying out their own ideas, doing work without feeling it is morally wrong, making their own decisions, (and) planning work with little supervision" tended to have higher aspirations and expectations, but lower goal deflection.—*Journal abstract.*

12712. Weaver, Charles N. & Holmes, Sandra L. (St Mary's U San Antonio, School of Business & Administration) **A comparative study of the work satisfaction of females with full-time employment and full-time housekeeping.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 117-118.—Evidence from 2 recent national opinion surveys casts doubt on the hypothesis that sex role socialization results in lower reported work satisfaction among females who have full-time jobs compared to those who keep house full time. The only instance where the hypothesis appears to have applicability arises out of the reaction of female workers to low-salaried jobs which do not provide or contribute to a family income perceived as equal to or above that of the average American family.—*Journal abstract.*

12713. Weitzel, William; Pinto, Patrick R.; Dawis, René V. & Jury, Philip A. (U Minnesota, Industrial Relations Ctr) **The impact of the organization on the structure of job satisfaction: Some factor analytic findings.** *Personnel Psychology*, 1973(Win), Vol 26(4), 545-557.—Studied the factor structure of job satisfaction ratings as a function of organization. 1,099 salaried employees from 5 operating companies of a single corporation were surveyed concerning responses to 28 satisfaction scales. Responses by company were factor analyzed and individual company factors were further analyzed for subgeneral and general factors. 4 job satisfaction factors emerged for all companies: Satisfac-

tion with Personal Progress, with Compensation, with Organizational Context, and with Superior-Subordinate Relationships. The 1st 2 factors could be subsumed under the subgeneral factor, Satisfaction with Job, and the 2nd 2 factors under the subgeneral factor, Satisfaction with Organization. Both subgeneral factors could be subsumed under a general satisfaction factor. Although factor structures were generally similar in all companies, 2 groupings were found on the basis of coefficients of congruence for factors. (17 ref)—*J. McKillip.*

12714. Weller, Leonard & Nadler, Aryeh. (Bar-Ilan U, Ramat-Gan, Israel) **Authoritarianism and job preference.** *Journal of Vocational Behavior*, 1975(Feb), Vol 6(1), 9-14.—Tested the hypothesis that authoritarian personalities prefer the natural sciences (specifically biology and chemistry) and nonauthoritarian personalities choose the social sciences and humanities (specifically, psychology and philosophy). Authoritarianism was measured in college freshmen Ss by means of a modified version of the California F Scale. Results strongly support the hypothesis. Since the study was conducted on freshmen in Israel who select their department at the time they apply for admission to the university, results are interpreted as indicating that authoritarians choose professions different from nonauthoritarians. (15 ref)—*Journal abstract.*

12715. Yom, B. Lee et al. (U Houston) **The factor structure of the Vocational Preference Inventory for black and white college students.** *Journal of Vocational Behavior*, 1975(Feb), Vol 6(1), 15-18.—Investigated whether the variables measured by the Vocational Preference Inventory (VPI) were the same for both black and white students. Kaiser et al (1969) have noted that the same measurements used with different populations may not measure the same variables and have presented a method of determining the degree of correspondence in the 2 populations. In the present study, the VPI scores for 115 black undergraduates and scores previously obtained from a group of white students were factor analyzed separately and the black structure was rotated to correspond to the white structure. The correspondence between the variables measured by the VPI for black and white students was found to be very similar, indicating that the VPI measures the same variables for both black and white college students.—*Journal abstract.*

The need for specialized training in this field is documented.

12720. **Gellerman, Saul W.** **Behavioral science in management.** Harmondsworth, England: Penguin, 1974. 133 p. \$2.25.—Provides specific examples of ways in which behavioral science has been used by companies to increase employee effectiveness. Concepts of personnel selection, management benevolence, and experimental intervention are examined.

12721. **Gruenfeld, Leopold & Kassum, Saleem.** (Cornell U, New York State School of Industrial & Labor Relations) **Supervisory style and organizational effectiveness in a pediatric hospital.** *Personnel Psychology*, 1973(Win), Vol 26(4), 531-544.—Examined the effect of supervisor style (i.e., employee consideration and initiation structure) on perceived organizational effectiveness to a hospital. 82 female nurses on the staff of a pediatric hospital were surveyed concerning supervisor's style and 3 effectiveness measures: satisfaction with supervisor, quality of patient care, and organizational coordination. Reported satisfaction with supervisor and quality of patient care were high only when rating of supervisor on employee consideration and initiation structure were both high. Reported organizational coordination was related only to rating of supervisor on initiation structure. It is concluded that both of the supervisor style dimensions are important for effective supervision. (19 ref)—*J. McKillip.*

12722. **Hunsaker, Philip L.; Mudgett, William C. & Wynne, Bayard E.** (U Wisconsin, Milwaukee) **The Leadership Assessment and Training Simulation: Training, assessment, and research implications.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 151.

12723. **Húska, Augustin M.** [The differential allocation of time to the creative phases of decision making in senior managers.] (Slovak) *Syntéza*, 1972(Feb), Vol 5(1), 10-13.—As part of a UNESCO research program, the International Academy of Management studied how best to develop and maintain the organizational creativity of top management. A panel of management scientists from the US, Western Europe, and Eastern Europe examined management decision making in enterprises from the US and 3 countries from both east and west blocs. Creative decision making had 5 phases: (a) data collection and verification; (b) weighing and analyzing the data; (c) applying creative, innovative imagination, and searching for new roads and ideas; (d) articulating the final decision and specifying alternatives and risks; and (e) implementing the decision and follow-up, especially overcoming obstacles. It was found that US executives devote most time to the 5th phase,

Western Europeans to the 4th phase, and Eastern Europeans to the 3rd phase. The differences between the US and Eastern European executives were in amount of risk and type of feedback. (English, French, German, & Russian summaries)—*P. Babarik.*

12724. **Jones, Allan P.; James, Lawrence R. & Bruni, John R.** (Texas Christian U, Inst for Behavioral Research) **Perceived leadership behavior and employee confidence in the leader as moderated by job involvement.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 146-149.—Examined the effect of job involvement upon the relationship between perceived leader behaviors and confidence and trust in the leader. 112 civil service and military engineering employees were subdivided into 2 groups on the basis of their job involvement scores. Results show that high-job-involvement Ss tended to have significantly lower correlations between confidence and trust and leadership variables.—*Journal abstract.*

Sherwood (Eds), *Integrating the organization: A social psychological analysis.* New York, NY: Free Press, 1974. xxiv, 370 p. \$14.95.

12726. **Kraut, Allen I.** (IBM Corp, Armonk, NY) **Prediction of managerial success by peer and training-staff ratings.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 14-19.—Examined the predictive validity of peer and training-staff ratings made under "real" conditions in an industrial situation. Ratings were obtained for 156 middle-level managers and 83 higher level executives attending a 4-wk training course. Analysis of 13 peer-related characteristics yielded 2 factors: Impact and Tactfulness. Follow-up showed that later success (promotion and performance appraisal) was predicted by most peer ratings mainly from the Impact factor. Training staff ratings were much weaker predictors and added little to the peer ratings. Broader use of peer ratings for executive selection is discussed. (15 ref)—*Journal abstract.*

12727. **Kuehl, Charles R.; DiMarco, Nicholas & Wims, Earl W.** (U Missouri, St Louis) **Leadership orientation as a function of interpersonal need structure.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 143-145.—Examined the relationship of interpersonal need structure as measured by the Fundamental Interpersonal Relations Orientation-Behavior Questionnaire (FIRO-B) to leadership orientation as measured by the Leadership Opinion Questionnaire (LOQ) and the Least Preferred Co-Worker Scale (LPC); Ss were 245 1st- and 2nd-level supervisors. The LPC score and the Consideration dimension of the LOQ were found to be positively related to all the FIRO-B scales except Expressed Control. Initiating Structure was positively related to Expressed Control. The LPC score was negatively related to Initiating Structure and positively related to Consideration.—*Journal abstract.*

12728. **Logan, Robert; O'Neil, Harold F.; Judd, Wilson A. & Harmon, E. Glynn.** (U Texas, Computer-Assisted Instruction Lab, Austin) **Technical literature review concerning management information systems.**

*Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 150-151.

12729. Moses, Joseph L. (American Telephone & Telegraph Co, New York, NY) **The development of an assessment center for the early identification of supervisory potential.** *Personnel Psychology*, 1973(Win), Vol 26(4), 569-580.—Compared results of the Early Identification Assessment program (EIA), a 1-day program for assessing and evaluating management potential in short-service employees, with those of the Personnel Assessment Program (PAP), which is currently used more widely but is more time-consuming. 85 white and black employees, men and women, who were evaluated by EIA staff as having high, moderate, or low management potential also took part in PAP. Overall management potential ratings correlated .73 for EIA and PAP, with similar correlations for all subgroups. Significant correlations were found for all variables common to both programs. The advantages of EIA over PAP for rapid assessment are discussed.—J. McKillip.

12730. O'Neil, Harold F.; Walker, Mary E. & Judd, Wilson A. (U Texas, Computer-Assisted Instruction Lab, Austin) **Feasibility and utility of an on-line information communication system in a research and development management and planning environment.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 151.

12731. Paine, Frank T. & Gannon, Martin J. (U Maryland, Behavioral Science Div) **Job attitudes of supervisors and managers.** *Personnel Psychology*, 1973(Win), Vol 26(4), 521-529.—Compared responses on job attitude survey of 404 supervisors and 317 managers employed in General Services Administration. Factor analysis of responses revealed 8 factors. Supervisors were significantly more negative on attitude items which loaded on factors labelled Equity of Rewards, Adequacy of Work Force, and Skill Utilization. Supervisors' negative orientation is discussed in relation to management practices within the organization.

12732. Recknagel, Kenneth H. (Leadership Development Assoc, Westwood, NJ) **Why management training fails and how to make it succeed.** *Personnel Journal*, 1974(Aug), Vol 53(8), 589-597. Points out that many efforts to improve managerial capability fall short of their goal and produce more talk and paperwork than substance. It is suggested that a new focus on the individual can make the difference between success and failure. 14 proposals, which range from personalizing the program to building an ethical system, show how the structure and process of any development effort can be improved.—P. L. Crawford.

12733. Rice, Robert W. & Chemers, Martin M. (U Utah) **Personality and situational determinants of leader behavior.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 20-27. —Tested hypotheses derived from F. Fiedler's (see PA, Vol 50:908) motivational hierarchy interpretation of least preferred co-worker (LPC) by observing the behavior of high- and low-LPC leaders of 32 3-man laboratory groups. High-LPC leaders showed greater variability in their behavior as a function of situational differences than did low-LPC leaders. Leader behavior differed as a function of leader attributes (LPC), situational factors (leader-member relations and task structure), and LPC  $\times$  Task Struc-

ture interactions. Results do not clearly support motivational hierarchy predictions. U. Foa, T. Mitchell, and F. Fiedler's (1971) cognitive analysis of the LPC, suggesting that the greater flexibility in behavior of high-LPC leaders is a consequent of a more complex cognitive structure, appeared more capable of accounting for these data. (18 ref)—*Journal abstract*.

### Organizational Structure & Climate

12734. Biles, George E. (Office of the Chief of Naval Operations, Shore Manpower Requirements Branch, Washington, DC) **Allegiances of unionized public employees toward employer and union.** *Public Personnel Management*, 1974(Mar-Apr), Vol 3(2), 165-169.—Surveyed by mail questionnaire 600 unionized public employees in Ohio and Kentucky, with 50% answering. These employees indicated less personal commitment either to employer or to the union than private sector employees have shown in other studies. It is suggested that the literature relative to union-employer relationships should be interpreted very carefully when applied to public employees.

12735. Bowen, Donald D. & Kilmann, Ralph H. (U Pittsburgh, Graduate School of Business) **Developing a comparative measure of the learning climate in professional schools.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 71-79.—Developed the Learning Climate Questionnaire (LCQ) to assess the learning climate of professional schools. 7 populations of students from 4 business schools and 1 nonbusiness professional school participated in this study ( $N = 455$ ). 5 factors were extracted from the LCQ (Grading Process, Physical Environment, Task Relationships with Faculty, Social Relationships with Faculty, and Course Material Presentation) which were fairly independent (average inter-correlations = .33) and had high internal consistency (average  $\alpha = .84$ ) across all samples. Comparisons of the objective properties of the schools and measures of overall student satisfaction with the LCQ factors suggest considerable validity of the instrument. Consequently, it seems appropriate to utilize the LCQ for substantive research investigations into the organizational dynamics of professional schools. (30 ref)—*Journal abstract*.

12736. Carlson, Gary B. (Central National Bank, Chicago, IL) **A human systems approach to coping with future shock.** *Personnel Journal*, 1974(Aug), Vol 53(8), 618-622.—Emphasizes that accelerating rates of change in the banking business must be met with modern approaches to human needs in the organization.

12737. Eisele, C. Frederick. (North Dakota State U) **Organization size, technology, and frequency of strikes.** *Industrial & Labor Relations Review*, 1974(Jul), Vol 27(4), 560-571.—Studied the relationship between the type and size of a manufacturing plant and the frequency of strikes at the plant. Medium-sized plants are indicated to have a greater frequency of strikes than very large or very small ones.

12738. Elliott, Ord & Penner, Donald D. (Purdue U) **The impact of social structure on organizational change.** In H. L. Fromkin & J. J. Sherwood (Eds), *Integrating the organization: A social psychological analysis*. New York, NY: Free Press, 1974. xxiv, 370 p. \$14.95.

12739. Fromkin, Howard L. & Sherwood, John J. (Eds.). (Purdue U) **Integrating the organization: A social psychological analysis.** New York, NY: Free Press, 1974. xxiv, 370 p. \$14.95.—Presents a series of separately authored chapters concerning the integration of minority groups into American organizations. The situation of blacks is stressed since more data are available.

12740. Fromkin, Howard L. (Purdue U) **A social psychological analysis of organizational integration.** In H. L. Fromkin & J. J. Sherwood (Eds.), *Integrating the organization: A social psychological analysis.* New York, NY: Free Press, 1974. xxiv, 370 p. \$14.95.

12741. Gavin, James F. (Colorado State U) **Organizational climate as a function of personal and organizational variables.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 135-139.—Conducted a study of 140 managerial level bank employees to determine the extent to which climate perceptions could be accounted for by measures of personal and organizational variables. Findings fail to support the expected interaction of personal and organizational measures but do indicate that personal and organizational variables alone accounted for significant amounts of variance in climate perceptions. (17 ref)—*Journal abstract.*

12742. Guion, Robert M. & Smith, Patricia C. (Bowling Green State U) **Motivation.** In H. L. Fromkin & J. J. Sherwood (Eds.), *Integrating the organization: A social psychological analysis.* New York, NY: Free Press, 1974. xxiv, 370 p. \$14.95.

12743. Lipták, Frantisek. [On structure and perspectives of contemporary organizational theory.] (Slok) *Syntéza*, 1972(Nov), Vol 5(4), 143-151.—Reviews world and Czechoslovak literature on organizational theory and systematically classifies various authors into a taxonomy with 5 objective foci, or criteria of theory, and 9 aspects, or levels of abstraction; i.e., with 45 cells in all. The criteria and abstraction levels are specified. A survey of 190 books (of approximately 900 in the field) showed management activity most studied, and universal or grand theory least. The social-psychological and mathematical approaches were found most utilized and the physiological, cybernetic, sociological, and system theory least utilized. No theory fitted any category perfectly and all theories combined elements from other categories. Different emphases were found in different countries. (33 ref)—*P. Babarik.*

12744. Mangham, I. L. (U Bath, School of Management, England) **Facilitating intraorganizational dialogue in a merger situation.** *Interpersonal Development*, 1973-1974, Vol 4(3), 133-147.—Discusses the behavioral characteristics of merger situations and presents a case study of an organization development intervention in such a circumstance. An attempt is made to illustrate the complexity of mergers and to focus upon facilitating dialog and cooperation between erstwhile "victor" and "vanquished."

12745. Matoušek, Oldřich & Hladký, Aleš. [Man and the stress aspect of work.] (Slok) *Syntéza*, 1971(Nov), Vol 4(5), 137-144.—Presents a review of the application of the concept of stress to modern work and work organization. Concepts and models of stress are elaborated with emphasis on value factors, and categories of stressor situations—content of task, work methods called

for, and social-psychological aspects. Human stress reactions are considered in terms of motor, cognitive, and physiological functioning. A multivariate systematic approach to evaluating stress is called for. (English, French, German, & Russian summaries) (15 ref)—*P. Babarik.*

12746. Perlak, Ivan. [Force, resistance and participation in the process of implementing a planned change.] (Slok) *Syntéza*, 1972(Nov), Vol 5(4), 127-132.—Discusses and analyzes the essential characteristics of planned change in field force terms, identifying force for change, resistance to change, and participation in change as the 3 most important factors in the implementation of change. These are represented as being on a complementary continuum ranging from the dominance of the changers—the originators—and submission of the objects of change—the subordinates—and the inverse. Participation is considered as the optimal balance, or fulcrum, between either-side control. Implementation from the top down may work under certain, usually emergency conditions, but often entails great resistance. The inverse extreme may be characterized by dissipation of energy and change in subjective rather than objective situations. Resistance is not necessarily to the change but to the process of change. The actual approach to change should always take into account organizational characteristics; thus approaches to change may cover the entire continuum. (English, Russian, French & German summaries)—*P. Babarik.*

12747. Porter, Lyman W. (U California, Graduate School of Administration, Irvine) **Communication: Structure and process.** In H. L. Fromkin & J. J. Sherwood (Eds.), *Integrating the organization: A social psychological analysis.* New York, NY: Free Press, 1974. xxiv, 370 p. \$14.95.

12748. Roberts, Karlene H.; O'Reilly, Charles A.; Bretton, Gene E. & Porter, Lyman W. (U California, School of Business Administration, Berkeley) **Organizational theory and organizational communication: A communication failure?** *Human Relations*, 1974(May), Vol 27(5), 501-524.—Reviews the literature on the role and importance of communication in analyzing organizational behavior and in designing organizational research. (69 ref)

12749. Taylor, Dalmás A. (U Maryland) **Should we integrate organizations?** In H. L. Fromkin & J. J. Sherwood (Eds.), *Integrating the organization: A social psychological analysis.* New York, NY: Free Press, 1974. xxiv, 370 p. \$14.95.

12750. Triandis, Harry C. (U Illinois) **Person perception: A review of the literature and implications for training.** In H. L. Fromkin & J. J. Sherwood (Eds.), *Integrating the organization: A social psychological analysis.* New York, NY: Free Press, 1974. xxiv, 370 p. \$14.95.

#### Human Factors Engineering & Safety

12751. Alluisi, Earl A.; Chiles, W. Dean & Smith, Richard P. (U Louisville, Performance Research Lab) **Human performance in military systems: Some situational factors influencing individual performance.** *Catalog of Selected Documents in Psychology*, 1974(Fal), Vol 4, 156.

12752. Beregovoi, G. T.; Krylova, N. V.; Soloveva, I. B. & Shibanov, G. P. [Assessing the effectiveness of human performance in space flight.] (Russ) *Voprosy Psikhologii*, 1974(Jul-Aug), No 4, 3-9.—Discusses the psychological assessment of the performance of astronauts under conditions of weightlessness, stimulus overload, isolation, and other unusual conditions encountered in space flight. The astronaut-spaceship system is more autonomous than any earthbound man-machine system, and the astronaut must function as observer, operator, troubleshooter, and controller of flight parameters. The assessment of the performance of astronauts under conditions of space flight should include the accepted general performance criteria, the psychophysiological characteristics of the astronaut himself, and his specific ability to perform in complex (e.g., emergency) situations. (English summary)—*L. Zusne*.

12753. Blomberg, Richard D. & Preusser, David F. (Dunlap & Assoc, Darien, CT) **Narcotic use and driving behavior. Accident Analysis & Prevention**, 1974(Sep), Vol 6(1), 23-32.—Data from interviews with methadone maintenance patients (experimental Ss) and nonaddicted controls indicate that experimental Ss were no worse drivers than controls either as methadone patients or as heroin addicts. Narcotic users may be able to compensate for drug effects while driving.

12754. Cross, Kenneth D. & de Mille, Richard. (Anapaca Sciences, Santa Barbara, CA) **Human factors in bicycle-motor vehicle accidents. Catalog of Selected Documents in Psychology**, 1974(Fal), Vol 4, 158.

12755. Dirken, J. M. & Klinkhamer, H. A. (Delft U of Technology, Netherlands) **Education and training in ergonomics in the Netherlands. Ergonomics**, 1974(Nov), Vol 17(6), 709-715.—Results of a survey suggest that much expansion is needed in the curricula of technological universities and higher vocational schools and that new courses shift the stress from physiological and psychological theory to technical, designing, and organizational applications and from diagnosis to prevention. (French & German summaries)

12756. Foley, William L. **High-speed rotating mirror system for wide-angle image projection. US AFHRL Technical Report**, 1974(Jun), No 74-42, 49 p.—Investigated the utilization of a continuous wave laser as a power source for projecting video display information. This was to be combined with modulation and deflection methods that would permit development of a wide field-of-view projective system using a single display channel. 2 designs for a magnetic support system were explored, the 1st based on the "Q" coil principle, and the 2nd utilizing all solid state design with a differential pickup. Results indicate that in the 1st design drift was severe, but in the 2nd, stable support and rotation could be maintained over an indefinite period. It is concluded that the 2nd device, with further work, can be adapted to a wide-angle scan system.—*Journal abstract*.

12757. Fraser, T. M. (U Waterloo, Ontario, Canada) **Recreation, technology, and system safety. Human Factors**, 1974(Oct), Vol 16(5), 447-453.—Presents a model of a man-machine-environment complex in which each man-machine system defines for itself an operational environment from within the ecosphere. This

model has application to all design for human use and to operation of man-machine systems. Its specific application to recreation is shown in relation to 3 areas: (a) considerations of system safety in recreation; (b) responsibilities and liabilities of manufacturers of recreational equipment; and (c) responsibilities of researchers, human factors engineers, and those who supply manufacturers with operational design data. It is argued that safety management requires an epidemiological rather than a therapeutic or piecemeal approach, and that until safety is considered systematically as an objective in the design and operation of a man-machine-environment complex, the optimal cannot be attained.—*Journal abstract*.

12758. Hayes, Don. (U Waterloo, Ontario, Canada) **Risk factors in sport. Human Factors**, 1974(Oct), Vol 16(5), 454-458.—Identifies and classifies sports injuries, differentiates reasonable and unreasonable risk taking, and stresses factors—aspects of the roles of participant, entrepreneur, and the sport itself—important to the prevention of sports-related injuries.

12759. Healy, Charles C. (U California, Graduate School of Education, Los Angeles) **Evaluation of a replicable group career counseling procedure. Vocational Guidance Quarterly**, 1974(Sep), Vol 23(1), 34-40.—Reports 2 field evaluations of a replicable, 5-stage career counseling procedure based on D. E. Super's career development theory. Ss in the 1st study included 28 randomly selected junior college freshmen, meeting weekly in 6 groups for 5 wks. Half the groups began late and served as quasi-control Ss. The counselors were 8 inexperienced MA students. In the 2nd study, Ss were 24 volunteer junior college students, meeting weekly in 4 groups for 5 wks. Counselors included 6 inexperienced MA students and the author. Ss completed pre- and postmeasures including certainty of educational and career plans and 4 Career Development Inventory scales. Both studies indicated significant ( $p < .05$ ) change toward higher certainty in Ss undergoing the procedure, greater specificity of deliberation, and more occupational information. Findings suggest that a theoretically derived, replicable career counseling procedure can be used effectively by novice counselors. Discussion includes strengths, limitations and modifications of the procedure.—*C. A. Heikkinen*.

12760. Hendry, L. B. (U Aberdeen, Scotland) **Human factors in sports systems: Suggested models for analyzing athlete-coach interaction. Human Factors**, 1974(Oct), Vol 16(5), 528-544.—Reviews research on the personalities of particular groups of athletes, considers social interaction within sports, and offers a number of theoretical constructs which might be utilized in the analysis of the athlete-coach relationship. These constructs are to some extent interdisciplinary and range from a social-systems framework to a social-action perspective. (72 ref)—*Journal abstract*.

12761. **Human Factors Lab.** (US Naval Training Equipment Ctr, Orlando, FL) **Annotated bibliography of Human Factors Laboratory Reports (1945-1968) Supplement No 1, 1968-1972. Catalog of Selected Documents in Psychology**, 1975(Win), Vol 5, 223.

12762. Kallina, Herbert & Zimmer, Adolf. (Westfalen Wilhelms-U, Psychologischen Inst, Münster, W Ger-

many) [Comparison of the effectiveness of different regulations for reflectors on street markers.] (Germ) *Zeitschrift für Experimentelle und Angewandte Psychologie*, 1974, Vol 21(4), 564-574.—Tested the effectiveness of differently colored reflectors for the right and left sides of the street compared with those used under current regulations, which prescribe reflectors of the same color on both sides. Reflectors showing a weak, level, left S-curve and a slightly climbing right curve on a public highway were judged by 63 highway patrolmen at night from a stationary car. Significantly more errors were made under existing conditions (the same reflectors on both sides), while the number of correct judgments of the course of the road increased significantly with red reflectors on the right and white reflectors on the left. The time needed to make the decision decreased significantly under the red-white reflector condition. (English & French summaries)—*W. J. Koppitz*.

12763. **Levy, Joseph.** (U Waterloo, Ontario, Canada) **An applied intersystem congruence model of play, recreation, and leisure.** *Human Factors*, 1974(Oct), Vol 16(5), 545-557.—Argues that scholarly writings on the causes and effects of play, recreation, and leisure from Aristotle's *Ethics* to the most contemporary study have been of a predominantly philosophical, speculative, and logical nature. Little effort has been devoted to empirically validating or systematically researching what motivates people to become involved in certain forms of leisure and what are the effects of participation in these activities. The present paper (a) proposes an applied intersystem congruence model of play, (b) discusses empirical evidence which offers preliminary evidence for the intersystem congruence model of play, and (c) suggests some problems for further consideration. (52 ref)—*Journal abstract*.

12764. **McKnight, A. James; Hundt, Alan G. & Cunningham, June S.** (Human Resources Research Organization, Div 1, Alexandria, VA) **The development of guides for teacher preparation in driver education.** *HumRRO Professional Paper*, 1974(Jun), No 12-74, 28 p.—Describes the development of 2 separate driver education teacher preparation guides, one for secondary school driver education teachers and the other for commercial driving school instructors. The development of both guides involved a 4-step process: (a) an analysis of both the highway transportation system and the instructional system, public and private, to identify instructional requirements imposed upon the driver education teacher; (b) identification of the performance, skill, and knowledge required of the driver educator in meeting his instructional requirements; (c) the preparation and assembly of materials needed to fulfill the instructional objectives; and (d) a large-scale review of the guides by representatives of the secondary school and commercial driving school communities.—*Journal abstract*.

12765. **Moeller, George & Chattin, Craig P.** (US Naval Submarine Medical Research Lab, Groton, CT) **Situation-specific experience and nitrogen narcosis in the diving experiment.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 154-158.—Conducted a study of 8 Navy hyperbaric chamber technicians to examine the effects of 3 factors—individual's diving history, interval

between dives, and similarity of dive profiles—on susceptibility to narcosis. Ss performed adaptive tracking and mental arithmetic tasks during 4 weekly 45-min exposures, 2 each at pressure equivalents of 33- and 198-foot depths. Order of exposure was counterbalanced over Ss. Performance in the adaptive tracking task provided evidence for induction of narcosis by a 1st exposure to compressed air at 7 ATA (atmospheres absolute), and reduction of susceptibility to narcosis in the 2nd 7 ATA exposure relative to the 1st exposure. Carry-over effects on narcosis of 1 hyperbaric exposure to another depended upon similarity of those exposures. Results indicate that the effects of situation-specific experience on "nitrogen narcosis," as opposed to those of general experience in hyperbaric contexts, have been seriously underestimated. (16 ref)—*Journal abstract*.

12766. **Orlick, T. D.** (U Ottawa, Ontario, Canada) **Sport participation: A process of shaping behavior.** *Human Factors*, 1974(Oct), Vol 16(5), 558-561.—Explores human environmental factors which appear to be directly related to a person's decision to participate or not to participate in sport and physical recreation. More specifically, certain factors within the child's sports environment are focused on which have been shown to influence his attraction to or avoidance of sports participation. 3 major behavioral determinants (role models, expectancies, and reinforcements) are examined and discussed. A recent study is briefly mentioned which attempted to obtain some information on the question of why, when given an equal opportunity, some children will participate in sport, while others will not.—*Journal abstract*.

12767. **Pelz, Donald C. & Krupat, Edward.** (U Michigan, Inst for Social Research) **Caution profile and driving record for undergraduate males.** *Accident Analysis & Prevention*, 1974(Sep), Vol 6(1), 45-58.—Evaluated a device called an Apprehension Meter on which 60 undergraduate males watched a 5-min film of highway driving as seen from the driver's seat and recorded a moment-by-moment judgment of degree of danger, or caution level. From responses to 6 discrete hazards and to intervening uneventful periods, several summary scores were derived of which 5 differentiated significantly by driving record. (16 ref)

12768. **Pesch, Alan J.; Hammell, Thomas J. & Ewalt, Frederick M.** (Eclectech Assoc, North Stonington, CT) **Tactical decision-making training system design.** *NAV. TRAEQUIPCEN*, 1974(Nov), No 73-C-0158-1, 71 p.—Describes the design characteristics for a prototype generalized tactical decision-making training system which can serve as an empirical test bed for applied research. The 4-level training structure is outlined, along with a training strategy that defines software and hardware characteristics and the need for, and characteristics of, a computer language especially designed for training simulations. (5 p ref)

12769. **Quandt, Richard E.** (Princeton U) **Some statistical characterizations of aircraft hijacking.** *Accident Analysis & Prevention*, 1974(Oct), Vol 6(2), 115-123.—Tested the hypothesis that hijackings of US registered aircraft since 1968 represent a homogeneous Poisson process. It is concluded that hijackings are not independent of one another and security precautions may need to

be intensified in periods following a hijacking. (French & German summaries)

12770. Rabideau, Gerald F. (U Waterloo, Ontario, Canada) **Human, machine, and environment aspects of snowmobile design and utilization.** *Human Factors*, 1974(Oct), Vol 16(5), 481-494.—Describes and analyzes the major problems—damage and injury-producing accidents, noise pollution, damage to private property, and detrimental effects on natural ecology—associated with the sport of snowmobiling. Examples are given that typify the current state-of-the-art investigations of the problem areas.

12771. Shealy, Jasper E.; Geyer, Lewis H. & Hayden, Robert. (State U New York, Buffalo) **Epidemiology of ski injuries: Effect of method of skill acquisition and release binding accident rates.** *Human Factors*, 1974(Oct), Vol 16(5), 459-473.—Observed a closed population of 2,071 skiers for an entire skiing season. 221 accidents were generated by the population. Distributions of age, sex, skill level, years of experience, marital status, and type of binding used were obtained prior to the start of the season. Exposure to risk was obtained at the end of the season. Injury data included measures of severity, location of injury (upper vs lower extremity), ski patrol involvement, binding release or not, and overall and lower-extremity injury rates. It is concluded that (a) lessons as presently structured are not contributing to ski safety and, in fact, are associated with high accident rates; (b) bindings that have more than 2 release modes have lower accident rates than those with only 2; (c) cable bindings are categorically dangerous by every accident variable available; and (d) a significant Sex  $\times$  Binding-Type interaction exists that has important implications for both female skiers and binding designers. (18 ref)—*Journal abstract*.

12772. Sowa, Vincent M. & Fraser, T. M. (U Waterloo, Ontario, Canada) **Systems safety in recreational and powered garden vehicles.** *Human Factors*, 1974(Oct), Vol 16(5), 474-480.—Urges the development of a standardized dynamic evaluation process which will be applicable to specialized power consumer vehicles on which the operator rides. A method of analysis is suggested for assuring adequate safety in which such a vehicle is considered not only as a dynamic man-machine system, but also as a dynamic man-machine system operating within a variety of dynamic environments.

12773. Wiener, Earl L. (U Miami) **On simultaneous monitoring and tracking.** *Journal of Applied Psychology*, 1975(Feb), Vol 60(1), 100-105.—Conducted a study of 72 undergraduates to examine the effects of time-sharing between a tracking and monitoring task presented on the same visual display and to evaluate the possibility that

knowledge of results on the monitoring task might offset any harmful effects due to time-sharing demands. Ss first performed a visual monitoring task with no knowledge of results; 2 days later they were assigned to 1 of 6 groups and performed the same task with or without knowledge of results under 1 of 3 levels of secondary task loads: high-frequency input compensatory tracking, low-frequency tracking, and no tracking. In addition, a 7th group ( $n = 12$ ) performed the tracking task only. Results show that time-sharing between monitoring and tracking degraded performance on both tasks, but tracking input frequency did not affect monitoring performance. Groups which received knowledge of results neither improved nor declined in monitoring performance when the time-sharing load was imposed. —*Journal abstract*.

12774. Wilkinson, R. T. (MRC Applied Psychology Unit (Annexe), Cambridge, England) **Individual differences in response to the environment.** *Ergonomics*, 1974(Nov), Vol 17(6), 745-756.—Assesses the effects of environmental stress, noting that comfort and working efficiency cannot necessarily be equated. The optimal experimental design for assessing individual differences differs fundamentally from that required for establishing population means. Reliable individual differences will only be revealed by repeated measures of a given effect upon the same people and under the same conditions. 2 difficulties are cited concerning individuals' acceptance levels of temperature and noise: (a) Individuals may differ in what they mean when they check one of a number of terms indicating varying degrees of discomfort or annoyance. (b) Where an O experiences a range of conditions, he will tend to place the center point of the rating scale at the center of the range of conditions sampled. Over a group of Os, this may bias the average comfort or acceptability vote away from its true point. On the other hand, differences between groups of Os may be minimized if the same range of conditions is presented to all. It is suggested that the presentation of a standard followed by a single test condition will avoid difficulties due to range effects but may encounter others due to suggestion or contrast effects. (French & German summaries) (21 ref)—*Journal abstract*.

12775. Williams, Allan R.; Siegel, Arthur I. & Burkett, James R. (Applied Psychological Services, Wayne, PA) **Readability of textual material: A survey of the literature.** Lowry Air Force Base, CO: Technical Training Div, 1974. 64 p.—Reviews and analyzes methods of measuring the readability-comprehensibility of textual materials. Formulas for calculating readability are presented and placed in historical perspective, and the general status of research into the development of readability indices is discussed. (97 ref)

## BRIEF SUBJECT INDEX

Entries in the Brief Subject Index are derived from a 4,000-term *Thesaurus of Psychological Terms*. Only those terms representing subject matter content covered in this monthly issue are listed. A thesaurus term missing from the listing indicates that no material of major relevance to the concept is included in the issue. Records are indexed at the level of specificity contained in each document. Each index entry also refers the reader to broader generic concepts as well as to more specific concepts related to each term. Thus, a reader interested in articles concerning childhood psychosis may find additional relevant information under "psychosis" or "early infantile autism."

**Auditory Measurement** [See Audiometry]  
**Auditory Neurons** 11005, 11031, 11043, 11992  
**Auditory Perception** [See Also Auditory Discrimination, Auditory Localization, Pitch Discrimination, Speech Perception] 10769, 10796, 10800, 10803, 10804, 10808, 10809, 10812, 10816, 10910, 10940, 10961, 11208, 11246, 11364, 11878, 11992, 11999  
**Auditory Stimulation** [See Also Auditory Feedback, Loudness, Pitch (Frequency), Speech Pitch, Ultrasound, White Noise] 10769, 10791, 10793, 10796, 10809, 10810, 10812, 10814, 10855, 10926, 10946, 10952, 10959, 10964, 11001, 11022, 11031, 11043, 11291, 11967, 11972, 12013, 12047, 12471  
**Auditory Thresholds** 10814, 10815, 11031, 11363, 12026  
**Aurally Handicapped** [See Deaf, Partially Hearing Impaired]  
**Australia** 11525  
**Austria** 11513

**Authoritarianism** 11530, 11545, 11713, 11735, 11770, 11791, 12621, 12638, 12714  
**Autistic Children** 11867, 12038, 12340  
**Autoeroticism** [See Masturbation]  
**Automated Information Processing** [See Also Automated Information Retrieval] 12730  
**Automated Information Retrieval** 12728  
**Automobile Accidents** [See Motor Traffic Accidents]  
**Automobile Safety** [See Highway Safety]  
**Automobiles** 12770, 12772  
**Autonomic Fibers (Postganglionic)** [See Autonomic Ganglia]  
**Autonomic Fibers (Preganglionic)** [See Autonomic Ganglia]  
**Autonomic Ganglia** 1231  
**Autonomic Nervous System** [See Also Autonomic Ganglia] 11044, 11057, 11870  
**Autopsy** 10992  
**Autosome Disorders** [See Down's Syndrome]  
**Aversion Therapy** 12196, 12200, 12206, 12210, 12215, 12232, 12245  
**Aversive Stimulation** 10909, 10978, 11119, 11127, 11128, 11141, 11280, 11284, 11289, 11290, 11300  
**Aviation** [See Spaceflight]  
**Aviators** [See Aircraft Pilots]  
**Avoidance Conditioning** 11082, 11106, 11125, 11140, 11157, 11165, 11166, 11177, 11211, 11263, 11273, 11282, 11284, 11289, 11290, 11293, 11299, 11309  
**Awareness** [See Also Attention, Divided Attention, Monitoring, Selective Attention, Vigilance] 11779  
**Babies** [See Infants]  
**Baboons** 11328  
**Background (Family)** [See Family Background]  
**Backward Masking** [See Masking]  
**Balance** [See Equilibrium]  
**Barbiturates** [See Also Hexobarbital, Pentobarbital, Phenobarbital] 11210, 11534, 11939  
**Barometric Pressure** [See Atmospheric Conditions]  
**Basal Ganglia** [See Amygdaloid Body, Caudate Nucleus]  
**Basal Readers** [See Reading Materials]  
**Baseball** 10762  
**Bayes Theorem** [See Statistical Probability]  
**Beetles** 11025  
**Behavior Change** 10671, 10984, 12218  
**Behavior Disorders** [See Also Alcoholism, Antisocial Behavior, Attempted Suicide, Cheating, Crime, Deception, Drug Abuse, Drug Addiction, Head Banging, Heroin Addiction, Juvenile Delinquency, Malingering, Nail Biting, Recidivism, Self Mutilation, Suicide, Theft] 11826, 11929, 11931, 12280, 12547  
**Behavior Modification** [See Also Aversion Therapy, Behavior Therapy, Classroom Behavior Modification, Contingency Management, Systematic Desensitization Therapy, Token Economy Programs] 10667, 10679, 11577, 11805, 11808, 11975, 12039, 12044, 12122, 12140, 12172, 12178, 12194, 12197, 12204, 12205, 12207, 12219, 12220, 12221, 12229, 12234, 12237, 12240,

# BRIEF SUBJECT INDEX

- 12292, 12293, 12314, 12320, 12322, 12337, 12344, 12467, 12513, 12522, 12530, 12644
- Behavior Problems** 11910, 11914, 11932, 12056, 12363, 12537, 12538
- Behavior Therapy** [See Also Aversion Therapy, Systematic Desensitization Therapy] 11786, 12150, 12172, 12173, 12174, 12176, 12186, 12188, 12199, 12200, 12201, 12212, 12213, 12216, 12217, 12221, 12225, 12228, 12236, 12249, 12251
- Behavior** [See Also Related Terms] 10677
- Behavioral Sciences** [See Social Sciences]
- Bekeasy Audiometry** [See Audiometry]
- Beliefs (Religion)** [See Religious Beliefs]
- Bender Gestalt Test** 12474
- Benzedrine** [See Amphetamine]
- Bias (Response)** [See Response Bias]
- Bibliography** 10674, 10692, 10932, 11075, 11460, 11567, 11569, 11605, 11713, 11816, 12178, 12240, 12425, 12636, 12761
- Bibliotherapy** 12105
- Bile** 11220
- Bilingualism** 11645, 12473
- Binocular Vision** 10845
- Biochemistry** [See Also Neurochemistry] 11163, 11164, 11184, 11360, 12133
- Biofeedback** 10669, 10998, 11759
- Biographical Inventories** 10707, 12566, 12741
- Biological Rhythms** [See Animal Circadian Rhythms, Human Biological Rhythms]
- Biological Symbiosis** 11257
- Biology** [See Also Neurobiology] 10997
- Birds** [See Also Chickens, Doves, Ducks, Pigeons, Quails, Sea Gulls] 11132, 11262, 11322, 11338, 11342, 11343
- Birth** [See Also Premature Birth] 11328, 11346, 11487, 11700, 11863
- Birth Control** [See Also Intrauterine Devices, Oral Contraceptives, Vasectomy] 11615
- Bisexuality** 11344
- Bitterness** [See Taste Stimulation]
- Blacks** [See Negroes]
- Blind** 11827, 12207, 12514, 12533, 12621
- Blood** [See Also Blood Plasma, Blood Serum] 11164
- Blood and Lymphatic Disorders** [See Anemia]
- Blood Flow** 11872, 11994
- Blood Plasma** [See Also Blood Serum] 11039, 11094
- Blood Pressure** [See Also Diastolic Pressure] 11040
- Blood Pressure Disorders** [See Essential Hypertension]
- Blood Serum** 11049, 11170, 11184, 12027
- Blood Transfusion** 10655
- Blue Collar Workers** [See Also Skilled Industrial Workers] 12687, 12688
- Body Fluids** [See Bile, Blood, Blood Plasma, Blood Serum, Cerebrospinal Fluid, Urine]
- Body Height** 12611
- Body Image** [See Also Body Image Disturbances] 11708, 11721, 12524
- Body Image Disturbances** 11721, 11851
- Body Language** 11576, 11652
- Body Temperature** [See Also Thermoregulation (Body)] 10863, 11058, 11250
- Body Weight** [See Also Obesity] 10989
- Bones** 12014
- Book** 10663, 10702, 10990, 11296, 11378, 11537, 11664, 11705, 11835, 11938, 12039, 12049, 12190, 12222, 12297, 12615, 12720, 12739
- Books** 10675, 10676, 11679, 12402
- Boredom** 11030, 11732, 12597
- Bourgeois** [See Middle Class]
- Brain** [See Also Amygdaloid Body, Auditory Cortex, Brain Stem, Caudate Nucleus, Cerebellum, Cerebral Cortex, Corpus Callosum, Diencephalon, Hippocampus, Hypothalamus, Inferior Colliculus, Limbic System, Mesencephalon, Occipital Lobe, Reticular Formation, Superior Colliculus, Thalamus, Visual Cortex] 11994
- Brain Ablation** [See Brain Lesions]
- Brain Damage** [See Also Brain Lesions] 11978, 11996, 12025, 12311
- Brain Damaged** 11838, 11944, 11980, 11998, 12001, 12017, 12023
- Brain Disorders** [See Also Alcohol Intoxication, Aphasia, Brain Damage, Brain Lesions, Brain Neoplasms, Cerebral Palsy, Delirium Tremens, Epilepsy, Epileptic Seizures, Minimal Brain Disorders, Parkinsons Disease, Presenile Dementia, Senile Dementia, Toxic Encephalopathies, Toxic Psychoses] 11999
- Brain Injuries** [See Brain Damage]
- Brain Lesions** 11079, 11080, 11082, 11098, 11099, 11113, 11114, 11118, 11121, 11122, 11123, 11124, 11125, 11127, 11129, 11135, 11137, 11138, 11140, 11144, 11234, 11992, 12016
- Brain Mapping** [See Stereotaxic Atlas]
- Brain Maps** [See Stereotaxic Atlas]
- Brain Metabolism** [See Neurochemistry]
- Brain Neoplasms** 11978
- Brain Stem** [See Also Reticular Formation] 11999
- Brain Stimulation** [See Also Chemical Brain Stimulation, Electrical Brain Stimulation, Spreading Depression] 11128
- Brain Weight** 10989, 11085, 11086
- Breast Feeding** 11487
- Breeding (Animal)** [See Animal Breeding]
- Brief Psychotherapy** 12138
- Brightness Perception** 10796, 10825, 11760
- Buddhism** [See Zen Buddhism]
- Budgets** [See Costs And Cost Analysis]
- Burns** 12060
- Business And Industrial Personnel** [See Also Blue Collar Workers, Clerical Personnel, Management Personnel, Sales Personnel, Skilled Industrial Workers, Top Level Managers, White Collar Workers] 11584, 11974, 12620, 12698, 12699, 12704, 12706
- Business Education** 12405
- Business Management** 12632
- Business Students** 12405, 12735
- Businessmen** [See Business And Industrial Personnel]
- Butterflies** 11253
- Buying** [See Consumer Behavior]
- Cadres** [See Social Groups]
- Caffeine** 11176
- Calculus** [See Mathematics Education]
- California Psychological Inventory** 11768
- Cameras** 10827
- Canada** 11427, 11461, 11542, 11563, 11775, 11885, 11896
- Cancers** [See Neoplasms]
- Cannabis** [See Also Hashish, Marijuana] 11165, 11495
- Capital Punishment** 11563
- Carbachol** 11101, 11107
- Carbohydrate Metabolism Disorders** [See Diabetes, Diabetes Mellitus]
- Carbohydrates** [See Glucose]
- Carcinomas** [See Neoplasms]
- Cardiac Disorders** [See Heart Disorders]
- Cardiac Rate** [See Heart Rate]
- Cardiovascular Disorders** [See Also Cerebrovascular Disorders, Essential Hypertension, Heart Disorders, Myocardial Infarctions] 11872, 12022
- Career Aspirations** [See Occupational Aspirations]
- Career Choice** [See Occupational Choice]
- Career Goals** [See Occupational Aspirations]
- Career Guidance** [See Occupational Guidance]
- Career Preference** [See Occupational Preference]
- Careers** [See Occupations]
- Carp** [See Also Goldfish] 11068
- Case History** [See Patient History]
- Case Report** 11829, 11893, 11935, 11960, 11988, 11997, 12038, 12043, 12056, 12092, 12095, 12117, 12128, 12134, 12160, 12163, 12188, 12197, 12201, 12206, 12207, 12210, 12213, 12215, 12225, 12232, 12237, 12249, 12259, 12264, 12268, 12269, 12305, 12306, 12310, 12313, 12323, 12530
- Caseworkers** [See Social Workers]
- Castration** [See Also Male Castration, Ovariectomy] 11091
- Catalepsy** 11155, 11202
- Catamnesis** [See Posttreatment Follow-up]
- Cataplexy** 11895
- Catecholamines** [See Also Dopamine, Epinephrine, Norepinephrine] 11087, 11094, 11102, 11105, 11131, 11195, 11230, 11245
- Categorizing** [See Classification (Cognitive Process)]
- Catharsis** 12099, 12229
- Cats** 10991, 10994, 11001, 11005, 11006, 11009, 11012, 11013, 11022, 11023, 11026, 11028, 11029, 11041, 11059, 11083, 11126, 11127, 11128, 11129, 11138, 11139, 11144, 11194, 11195, 11207
- Caucasians** 11413, 11482, 11892, 12181, 12329, 12362, 12479, 12504, 12542, 12563, 12574, 12580, 12654, 12667, 12679, 12715
- Caudate Nucleus** 11080, 11122, 11140, 11180, 11207
- Celiac Plexus** [See Autonomic Ganglia]
- Cells (Biology)** [See Auditory Neurons, Motor Neurons, Neurons, Sensory Neurons]
- Central Nervous System** [See Also Amygdaloid Body, Auditory Cortex, Brain, Brain Stem, Caudate Nucleus, Cerebellum, Cerebral Cortex, Corpus Callosum, Diencephalon, Hippocampus, Hypothalamus, Inferior Colliculus, Limbic System, Mesencephalon, Occipital Lobe, Reticular Formation, Spinal Cord, Super-

- rior Colliculus, Thalamus, Visual Cortex] 11008, 11022, 11231, 11247, 11986
- Central Nervous System Disorders** [See Also Aphasia, Brain Damage, Brain Disorders, Brain Lesions, Brain Neoplasms, Cerebral Palsy, Chorea, Delirium Tremens, Epilepsy, Epileptic Seizures, Huntingtons Chorea, Minimal Brain Disorders, Parkinsons Disease, Presenile Dementia, Senile Dementia, Toxic Psychoses] 11932
- Central Nervous System Drugs** [See CNS Affecting Drugs]
- CER (Conditioning)** [See Conditioned Emotional Responses]
- Cerebellar Cortex** [See Cerebellum]
- Cerebellar Nuclei** [See Cerebellum]
- Cerebellopontine Angle** [See Cerebellum]
- Cerebellum** 11108, 11872
- Cerebral Cortex** [See Also Amygdaloid Body, Auditory Cortex, Caudate Nucleus, Corpus Callosum, Hippocampus, Limbic System, Occipital Lobe, Visual Cortex] 10991, 11113, 11135
- Cerebral Dominance** [See Also Lateral Dominance] 10794, 10799, 10802, 10825, 10840, 10862, 11007, 11011, 11016, 11046, 11400, 11941, 11970, 11977, 11980, 12028
- Cerebral Lesions** [See Brain Lesions]
- Cerebral Palsy** 11990
- Cerebral Vascular Disorders** [See Cerebrovascular Disorders]
- Cerebrospinal Fluid** 11233, 11836
- Cerebrovascular Disorders** 11872
- Cerebrum Affecting Drugs** [See Chlorpromazine]
- Chains (Markov)** [See Markov Chains]
- Chance (Fortune)** [See Probability, Statistical Probability]
- Character** [See Personality]
- Character Development** [See Personality Development]
- Character Disorders** [See Personality Disorders]
- Character Formation** [See Personality Development]
- Character Traits** [See Personality Traits]
- Charitable Behavior** 11610
- Cheating** 11734, 11747
- Chemical Brain Stimulation** 11080, 11101, 11102, 11105, 11107, 11109, 11115, 11116, 11130, 11131, 11133, 11134, 11136, 11137, 11176
- Chemical Elements** [See Lead (Metal), Magnesium, Metallic Elements, Oxygen, Sodium]
- Chemistry** [See Also Biochemistry, Neurochemistry] 11185, 11209
- Chemoreceptors** 11014, 11032
- Chemotherapy** [See Drug Therapy]
- Cheyenne Indians** [See American Indians]
- Chickens** 11046, 11245, 11276, 11283, 11307, 11353
- Child Day Care** 12280, 12303
- Child Discipline** 11450
- Child Guidance Clinics** 11932
- Child Psychiatric Clinics** [See Child Guidance Clinics]
- Child Psychiatry** 12048, 12088
- Child Psychology** 10675
- Child Psychotherapy** 12067, 12118, 12127
- Childbirth** [See Birth]
- Childhood** [See Children]
- Childhood Development** [See Also Infant Development, Neonatal Development] 10700, 11367, 11371, 11383, 11385, 11450, 11688, 11873
- Childhood Play Development** 11371, 11385, 11459, 11464
- Childhood Psychosis** [See Also Childhood Schizophrenia] 11852, 11897
- Childhood Schizophrenia** 11880
- Childrearing Attitudes** 11452
- Childrearing Practices** [See Child Discipline]
- Children** [See Also Infants, Neonates, Preschool Age Children, School Age Children] 10780, 11402, 11420, 11432, 11433, 11674, 11812, 11826, 11828, 11853, 11857, 11858, 11942, 11945, 11949, 11950, 11952, 11959, 11961, 11963, 11964, 11965, 11966, 11990, 12010, 12012, 12014, 12030, 12036, 12118, 12164, 12220, 12280, 12285, 12293, 12295, 12296, 12297, 12303, 12324, 12403, 12453, 12471, 12472, 12521, 12522, 12526, 12533, 12536, 12558
- Chinchillas** 11233
- Chlordiazepoxide** 11204, 11206
- Chlorpromazine** 11098, 11210, 11240, 12147
- Choice Behavior** 10972, 10980, 11304
- Cholinergic Blocking Drugs** [See Also Atropine, Nicotine, Scopolamine] 11169, 11188, 11192
- Cholinergic Drugs** [See Physostigmine, Pilocarpine]
- Cholinesterase Inhibitors** [See Physostigmine]
- Cholinomimetic Drugs** [See Acetylcholine, Carbachol, Physostigmine, Pilocarpine]
- Chorea** [See Also Huntingtons Chorea] 12213
- Choroid** [See Eye (Anatomy)]
- Chromosome Disorders** [See Down Syndrome, Sex Chromosome Disorders]
- Chronic Psychosis** [See Also Chronic Schizophrenia] 12281
- Chronic Schizophrenia** 11872, 11905, 12124, 12170
- Cichlids** 11262, 11323, 11340
- Cigarette Smoking** [See Tobacco Smoking]
- Circadian Rhythms (Animal)** [See Animal Circadian Rhythms]
- Circulatory Disorders** [See Cardiovascular Disorders]
- Circumcision** [See Surgery]
- Cirrhosis (Liver)** 11190
- Cities** [See Urban Environments]
- Civil Rights Movement** 11516, 11561, 11795, 11946, 11951, 12292
- Clairvoyance** [See Precognition]
- Class Attitudes** [See Socioeconomic Class Attitudes]
- Classical Conditioning** [See Also Conditioned Emotional Responses, Conditioned Responses, Conditioned Stimulus, Conditioned Suppression, Unconditioned Responses] 10909, 11036, 11123, 11279, 11285, 11310
- Classificat (Psychiatric Taxonomies)** [See Psychodiagnostic Typologies]
- Classificat (Psychodiagnostic Taxono)** [See Psychodiagnostic Typologies]
- Classificat (Psychodiagnostic Proc)** [See Psychodiagnosis]
- Classification (Cognitive Process)** 10801, 10830, 10871, 10879, 10880, 10915, 10933, 10951, 10969, 10976, 11393, 11413, 11418, 11471, 11479, 11954, 12385, 12473, 12583
- Classification (Psychiatric Process)** [See Psychodiagnosis]
- Classification Systems** [See Taxonomies]
- Classroom Behavior** 12363, 12384, 12393
- Classroom Behavior Modification** 12233, 12396, 12406, 12445, 12446, 12447, 12449, 12513, 12517, 12573
- Classroom Environment** 12387, 12507, 12594, 12606
- Classroom Instruction** [See Teaching]
- Classroom Teachers** [See Teachers]
- Clergy** [See Ministers (Religion), Nuns, Priests]
- Clerical Personnel** 12619
- Clerical Secretarial Skills** 10761
- Clerks** [See Clerical Personnel]
- Client Characteristics** 11787, 11800, 12037, 12065, 12068, 12080, 12112, 12120, 12294
- Client Counselor Interaction** [See Psychotherapeutic Processes]
- Climate (Organizational)** [See Organizational Climate]
- Clinical Judgment (Med Diagnosis)** [See Medical Diagnosis]
- Clinical Judgment (Psychodiagnosis)** [See Psychodiagnosis]
- Clinical Methods Training** [See Also Community Mental Health Training, Counselor Education, Mental Health Inservice Training, Psychiatric Training, Psychoanalytic Training] 10667, 11781, 11784, 11805, 11808, 11812, 11817, 12178, 12197
- Clinical Psychologists** 11149, 11203
- Clinical Psychology** 10676
- Clinics** [See Child Guidance Clinics, Psychiatric Clinics]

- Design (Experimental) [See Experimental Design]

# BRIEF SUBJECT INDEX

Design (Man Machine Systems) [See Man Machine Systems Design]  
 Desirability (Social) [See Social Desirability]  
 Desires [See Motivation]  
 Detection (Signal) [See Signal Detection (Perception)]  
 Developmental Age Groups [See Adolescents, Adults, Aged, Children, Infants, Middle Aged, Neonates, Preschool Age Children, School Age Children, Young Adults]  
 Developmental Differences [See Also Age Differences, Delayed Development] 10712, 11374  
 Developmental Psychology [See Also Child Psychology] 11366, 11380, 11389  
 Developmental Stages 11351, 12693  
 Deviant Behavior [See Antisocial Behavior]  
 Deviations (Sexual) [See Sexual Deviations]  
 Devices (Experimental) [See Apparatus]  
 Devices (Safety) [See Safety Devices]  
 Dexamphetamine [See Dextroamphetamine]  
 Dexedrine [See Dextroamphetamine]  
 Dexterity (Physical) [See Physical Dexterity]  
 Dextroamphetamine 11099, 11105, 11122, 11168, 11179, 11206, 11217, 11224, 11240, 11244, 11923  
 Diabetes [See Also Diabetes Mellitus] 11157, 11158  
 Diabetes Mellitus 11833  
 Diacetylmorphine [See Heroin]  
 Diagnosis [See Also Differential Diagnosis, Echoencephalography, Electroencephalography, Electromyography, Galvanic Skin Response, Medical Diagnosis, Psychodiagnostics] 11402, 11837, 11996, 12006, 12527  
 Dialect 11668  
 Dialysis [See Hemodialysis]  
 Diastolic Pressure 11991  
 Diazepam 11237, 11246, 11247, 12138  
 Diencephalon [See Also Hypothalamus, Thalamus] 11121  
 Differential Diagnosis 11831, 11838, 11850, 11879, 11961, 12266  
 Differential Limen [See Thresholds]  
 Differential Reinforcement 11311  
 Difficulty Level (Test) 12541  
 Digestive System [See Gastrointestinal System, Liver, Teeth (Anatomy), Tongue]  
 Digestive System Disorders [See Cirrhosis (Liver), Gastrointestinal Ulcers, Liver Disorders, Toxic Hepatitis]  
 Digits (Mathematics) [See Numbers (Numerals)]  
 Dilantin [See Diphenylhydantoin]  
 Dilation (Pupil) [See Pupil Dilation]  
 Diphenylhydantoin 11235, 12155  
 Diphenylhydantoin Sodium [See Diphenylhydantoin]  
 Diptera [See Drosophila]  
 Disadvantaged 11370, 12365, 12513, 12563, 12619, 12631  
 Disasters 11875  
 Discipline (Child) [See Child Discipline]  
 Discrimination (Cognitive) [See Cognitive Discrimination]  
 Discussion (Group) [See Group Discussion]  
 Diseases [See Disorders]

Diseases (Venereal) [See Venereal Diseases]  
 Disorders [See Also Related Terms] 12007, 12318  
 Displays [See Animal Courtship Displays, Tactual Displays, Visual Displays]  
 Disposition [See Personality]  
 Disruptive Behavior [See Behavior Problems]  
 Dissociative Patterns [See Amnesia]  
 Dissonance (Cognitive) [See Cognitive Dissonance]  
 Distance Discrimination [See Distance Perception]  
 Distance Perception 10817, 10829, 10842, 10850  
 Distortion (Perceptual) [See Illusions (Perception)]  
 Distractibility 11707  
 Distributed Practice 10998  
 Distribution (Frequency) [See Frequency Distribution]  
 Disturbed (Emotionally) [See Emotionally Disturbed]  
 Diuretics [See Caffeine]  
 Diurnal Variations [See Human Biological Rhythms]  
 Divided Attention 10889, 11208

 Enlistees [See Volunteer Military Personnel]

# BRIEF SUBJECT INDEX

**Enlistment (Military)** [See Military Enlistment]  
**Enuresis** [See Urinary Incontinence]  
**Environment** [See Also Animal Environments, Classroom Environment, College Environment, Communities, Ghettos, Home Environment, Kibbutz, Neighborhoods, Rural Environments, School Environment, Social Environments, Suburban Environments, Urban Environments, Working Conditions] 12510, 12607  
**Environmental Adaptation** 10671, 11254  
**Environmental Effects** [See Also Atmospheric Conditions, Cold Effects, Heat Effects, Noise Effects, Temperature Effects, Underwater Effects, Weightlessness] 11070, 11427, 12582, 12772  
**Environmental Stress** 10986, 11048, 11526, 12164, 12774  
**Enzymes** [See Also Hydroxylases] 11051, 11094, 11184, 11201  
**Epidemiology** 11913  
**Epilepsy** [See Also Epileptic Seizures] 11585, 11985, 11992  
**Epileptic Seizures** 11988  
**Epinephrine** 11166, 11181, 12005  
**Equality (Social)** [See Social Equality]  
**Equilibrium** 10873, 11389  
**Equipment** [See Apparatus]  
**Ergonomics** [See Human Factors Engineering]  
**Ergot Derivatives** 11103  
**Eroticism** 11554  
**Error Analysis** 10720, 10748  
**Errors** [See Also Prediction Errors] 10737  
**Escape Behavior (Animal)** [See Animal Escape Behavior]  
**Escape Conditioning** 11280, 11300, 11301, 11308  
**Eserine** [See Physostigmine]  
**ESP (Parapsychology)** [See Extrasensory Perception]  
**Essential Hypertension** 11991  
**Esteem (Self)** [See Self Esteem]  
**Estimation** [See Also Time Estimation] 11638  
**Estradiol** 11092  
**Estrogens** [See Also Estradiol] 11091, 11170, 11215  
**Estrus** 11092  
**Ethanol** 11078, 11148, 11151, 11162, 11173, 11196, 11201, 11222, 11223, 11921  
**Ethics** [See Also Personal Values, Professional Ethics, Social Values, Values] 11683  
**Ethnic Disorders** [See Ethnospecific Disorders]  
**Ethnic Groups** [See Also American Indians, Mexican Americans, Tribes] 11461, 11719, 11885, 12576  
**Ethnic Identity** 11722, 12374, 12504, 12576  
**Ethnic Values** 12374  
**Ethnospecific Disorders** 11862, 12079, 12091  
**Ethology (Animal)** [See Animal Ethology]  
**Ethyl Alcohol** [See Ethanol]  
**Etiology** 11493, 11508, 11833, 11859, 11931, 11935, 11959, 12022, 12027, 12092  
**Euphoria** 11924  
**Europe** 12098, 12723  
**Evaluation** [See Also Educational Program Evaluation, Mental Health Program Evaluation, Personnel Evaluation, Self Evaluation] 10739, 11799, 12047, 12338, 12383, 12404, 12486  
**Evaluation (Educational Program)** [See Educational Program Evaluation]  
**Evaluation (Mental Health Program)** [See Mental Health Program Evaluation]  
**Evaluation (Personnel)** [See Personnel Evaluation]  
**Evaluation (Self)** [See Self Evaluation]  
**Evaluation (Treatment Effectiveness)** [See Treatment Effectiveness Evaluation]  
**Evoked Potentials** [See Also Auditory Evoked Potentials, Visual Evoked Potentials] 11020, 11029, 11128  
**Evolution (Theory of)** [See Theory of Evolution]  
**Exceptional Children (Gifted)** [See Gifted]  
**Exceptional Children (Handicapped)** [See Handicapped]  
**Excretion** [See Also Urination] 11220  
**Executives** [See Top Level Managers]  
**Exercise** 10892, 11038, 11757  
**Exhaustion** [See Fatigue]  
**Exhibitionism** 11935  
**Existential Therapy** 12182  
**Existentialism** 10674, 10696, 11835, 12074  
**Expectations** 10869, 10942, 10978, 12686, 12706  
**Expectations (Role)** [See Role Expectations]  
**Experience (Practice)** [See Practice]  
**Experience Level (Job)** [See Job Experience Level]  
**Experiences (Events)** [See Also Early Experience, Life Experiences, Vicarious Experiences] 11744  
**Experiences (Life)** [See Life Experiences]  
**Experiment Volunteers** 11795  
**Experimental Apparatus** [See Apparatus]  
**Experimental Design** [See Also Followup Studies, Hypothesis Testing, Longitudinal Studies] 10654, 10656, 10666, 10669, 10678, 11464, 12053  
**Experimental Instructions** 10661, 10903, 10938, 10985, 12490  
**Experimental Laboratories** 10651  
**Experimental Methods** 10654, 10658, 10659, 10661, 10665, 10668, 10680, 10697, 10698, 10703, 10706, 10709, 10751, 10779, 11149, 11203, 11212, 11253, 11315, 11324, 11539, 11635, 11678, 11683, 11721, 11799, 11922, 12355, 12562  
**Experimental Replication** 10697, 10777, 11377, 11573, 11648, 12669  
**Experimentation** [See Also Related Terms] 10657, 10673, 11075, 11876, 12359, 12361, 12639  
**Experimenters** 10661, 11011, 11535, 11795  
**Expert Testimony** 11549, 11562  
**Exploratory Behavior** [See Also Animal Exploratory Behavior] 11467  
**Exposure Time (Stimulus)** [See Stimulus Duration]  
**Expressions (Facial)** [See Facial Expressions]  
**Extinction (Learning)** 11174, 11279, 11282, 11292, 11299, 11303, 11319, 12173  
**Extrasensory Perception** [See Also Precognition, Psychokinesis] 10773, 10777

# BRIEF SUBJECT INDEX

- Mental Health Centers (Community)** [See Community Mental Health Centers]  
**Mental Health Consultation** 12288, 12392  
**Mental Health Inservice Training** 11777, 11815  
**Mental Health Personnel** [See Also Clinical Psychologists, Psychiatric Aides, Psychiatric Nurses, Psychiatrists, Psychoanalysts, Psychotherapists, School Psychologists] 11436, 11501, 11517, 11774, 11784, 11794, 11797, 11812, 11911, 12090, 12303, 12719  
**Mental Health Program Evaluation** 11822, 12274, 12279, 12304  
**Mental Health Programs** [See Also Crisis Intervention Services, Hot Line Services] 11812, 12272, 12275, 12276, 12278, 12280, 12283, 12289, 12297, 12300, 12334, 12336, 12718, 12719  
**Mental Health Training (Community)** [See Community Mental Health Training]  
**Mental Hospitals** [See Psychiatric Hospitals]  
**Mental Illness** [See Mental Disorders]  
**Mental Illness (Attitudes Toward)** 11847, 11865, 11877, 11891  
**Mental Retardation** [See Also Downs Syndrome] 11827, 11948, 11955, 11959, 11984, 12527  
**Mentally Retarded** [See Also Educable Mentally Retarded, Institutionalized Mentally Retarded, Profoundly Mentally Retarded, Trainable Mentally Retarded] 11817, 11940, 11950, 11951, 11954, 11956, 11958, 11964, 11966, 11969, 12122, 12233, 12319, 12322, 12325, 12328, 12332, 12338, 12461, 12518, 12526, 12528, 12536  
**Mercury Poisoning** 11248  
**Mescaline** 11159, 11225  
**Mesencephalon** [See Also Inferior Colliculus, Superior Colliculus] 11083, 11137, 11139  
**Mesoridazine** 12147  
**Messages** 11612  
**Metabolism** [See Also Metabolites, Protein Metabolism] 11067, 11088, 11201, 11220, 11836, 11921  
**Metabolism Disorders** [See Also Diabetes, Diabetes Mellitus, Phenylketonuria] 11984  
**Metabolites** 10992, 11159, 11836  
**Metal Poisoning** [See Mercury Poisoning]  
**Metallic Elements** [See Also Lead (Metal), Magnesium, Sodium] 11229  
**Methadone** 11182, 11220, 11911, 11917, 11928, 12161, 12753  
**Methadone Maintenance** [See Drug Rehabilitation, Methadone]  
**Methamphetamine** 11160, 11238, 12149  
**Methaqualone** 11534  
**Methedrine** [See Methamphetamine]  
**Methodology** [See Also Related Terms] 10749, 11232, 11842  
**Methylatropine** [See Atropine]  
**Methylmorphine** [See Codeine]  
**Methylphenidate** 12161  
**Metrazole** [See Pentylentetrazol]  
**Mexican Americans** 11486, 11716, 11719, 12103, 12131, 12374, 12463, 12669, 12680  
**Mexico** 11485, 11491  
**Mice** 10988, 10989, 11040, 11070, 11071, 11075, 11077, 11089, 11092, 11096, 11115, 11118, 11131, 11151, 11154, 11155, 11162, 11164, 11168, 11172, 11176, 11183, 11197, 11200, 11204, 11210, 11236, 11249, 11250, 11251, 11292, 11316, 11324, 11325, 11329, 11336, 11337, 11346  
**Micturition** [See Urination]  
**Middle Aged** 10886, 11471, 11472, 11608, 11960, 11994  
**Middle Class** 11413, 11449, 11461, 11485, 11668, 12508  
**Migraine Headache** 12033, 12308  
**Migration (Human)** [See Human Migration]  
**Mildly Mentally Retarded** [See Educable Mentally Retarded]  
**Milieu Therapy** [See Therapeutic Community]  
**Militancy** 12684  
**Military Enlistment** 12593, 12614  
**Military Personnel** [See Also Air Force Personnel, Army Personnel, Enlisted Military Personnel, Marine Personnel, Navy Personnel, Volunteer Military Personnel] 12685, 12751  
**Military Recruitment** 12593, 12614, 12654, 12655  
**Military Training** 12286, 12364, 12579, 12626, 12627, 12634, 12642, 12643, 12646, 12650, 12654, 12657, 12660, 12671, 12673, 12675, 12676, 12768  
**Military Veterans** 12585  
**Minimal Brain Disorders** 11738, 11826, 11981, 12014, 12030, 12141, 12529  
**Ministers (Religion)** 12062  
**Minn Multiphasic Personality Invent** 10717, 11762, 11826, 11830  
**Minor Tranquilizers** [See Chlordiazepoxide]  
**Minority Groups** 11806, 12494, 12549, 12576, 12631, 12644, 12670, 12696, 12725, 12739, 12742, 12750  
**Misbehavior** [See Behavior Problems]  
**Misconduct** [See Behavior Problems]  
**Misdemeanors** [See Crime]  
**Mistakes** [See Errors]

**Mobility (Occupational)** [See Occupational Mobility]  
**Modeling** [See Simulation]  
**Modeling Behavior** [See Imitation (Learning)]  
**Models** 10872, 11391, 11565  
**Moderately Mentally Retarded** [See Trainable Mentally Retarded]  
**Mohave Indians** [See American Indians]  
**Mollusca** 11062, 11064, 11186  
**Monetary Incentives** 11449, 11541, 12690, 12704  
**Money** 12602  
**Mongolism** [See Downs Syndrome]  
**Monitoring** [See Also Vigilance] 12773  
**Monkeys** 10866, 10991, 11018, 11043, 11111, 11113, 11135, 11136, 11173, 11234, 11260, 11269, 11277, 11284, 11289, 11290, 11330, 11331, 11339, 11344, 11350, 11355, 11359, 11363  
**Monoamine Oxidase Inhibitors** [See Pargoline]  
**Monoocular Vision** 10760, 10836, 10845, 11046  
**Montessori Method** 12441  
**Moods** [See Emotional States]  
**Moral Development** 11396, 11453, 11846, 12370, 12403  
**Morality** 11509, 11690  
**Mores** [See Values]  
**Morons** [See Educable Mentally Retarded]  
**Morphemes** 11942  
**Morphine** 11095, 11115, 11136, 11155, 11156, 11169, 11187, 11200, 11218, 11231, 11241  
**Mortality** [See Death And Dying]  
**Mortality Rate** 11377, 11834  
**Mother Child Relations** 11396, 11445, 11451, 11452, 11457, 11465, 11467  
**Mothers** [See Also Unwed Mothers] 11445, 11450, 11455, 11486, 11625, 11845, 12512  
**Moths** 11253, 11357  
**Motion Perception** 10795, 10817, 10826, 10844  
**Motion Pictures** [See Also Motion Pictures (Entertainment)] 10926  
**Motion Pictures (Entertainment)** 11666  
**Motivation** [See Also Academic Achievement Motivation, Achievement Motivation, Affiliation Motivation, Animal Motivation, Employee Motivation, Incentives, Monetary Incentives, Temptation, Thirst] 10867, 10873, 10927, 10977, 10983, 10984, 11459, 11593, 11614, 11724, 11763, 11764, 11912, 11933, 12037, 12397, 12553, 12558, 12593, 12674  
**Motor Coordination** 11222  
**Motor Development** [See Speech Development]  
**Motor Disorders** [See Nervous System Disorders]  
**Motor Neurons** 11062  
**Motor Performance** 10862, 10863, 10864, 10865, 11063, 11386  
**Motor Processes** [See Also Exercise, Motor Coordination, Motor Performance, Motor Skills, Physical Dexterity] 10786, 11087, 11116, 11151, 11168, 11183, 11247, 11251, 11261, 11316, 11356  
**Motor Skill Learning** [See Perceptual Motor Learning]  
**Motor Skills** 10859, 10860, 11015  
**Motor Traffic Accidents** 12754  
**Motor Vehicles** [See Automobiles]  
**Mourning** [See Grief]  
**Movement Perception** [See Motion Perception]  
**Movements (Activist)** [See Activist Movements]  
**Movements (Social)** [See Social Movements]  
**Movies** [See Motion Pictures (Entertainment)]  
**Multilingualism** [See Bilingualism]  
**Multiple Births** [See Twins]  
**Multiple Choice (Testing Method)** 12560  
**Multiple Therapists** [See Conjoint Therapy]  
**Multiply Handicapped** 12514, 12533  
**Muscle Relaxation** 12253  
**Muscle Relaxation Therapy** [See Systematic Desensitization Therapy]  
**Muscle Relaxing Drugs** [See Also Diazepam] 11153  
**Muscles** [See Also Facial Muscles] 11026, 11153, 12253  
**Muscular Disorders** [See Torticollis]  
**Musculoskeletal Disorders** [See Torticollis]  
**Musculoskeletal System** [See Bones, Facial Muscles, Feet (Anatomy), Fingers (Anatomy), Hand (Anatomy), Muscles]

# BRIEF SUBJECT INDEX

- Profoundly Mentally Retarded** 12207, 12219, 12232, 12530
- Prognosis** 11402, 11799, 11867, 11884, 11987, 12261, 12349
- Program Evaluation (Educational)** [See Educational Program Evaluation]
- Program Evaluation (Mental Health)** [See Mental Health Program Evaluation]
- Program Planning (Educational)** [See Educational Program Planning]
- Programed Instruction** 11431, 11810, 11998
- Programming (Computer)** [See Computer Software]
- Programming Languages (Computer)** [See Computer Programming Languages]
- Programs (Government)** [See Government Programs]
- Programs (Mental Health)** [See Mental Health Programs]
- Project Head Start** 12365
- Projective Personality Measures** [See Also Bender Gestalt Test, Color Pyramid Test, Onomatopoeia And Images Test, Rorschach Test, Thematic Apperception Test] 12006
- Projective Techniques** [See Bender Gestalt Test, Color Pyramid Test, Onomatopoeia And Images Test, Projective Personality Measures, Rorschach Test, Thematic Apperception Test]
- Prolactin** 11163
- Prolxin** [See Fluphenazine]
- Propaganda** 12453
- Propranolol** 11188, 12137
- Prostate** 11216
- Protein Metabolism** 11236
- Proteins** [See Also Antibodies] 11032, 11093, 11356
- Psychedelic Drugs** [See Lysergic Acid Diethylamide]
- Psychiatric Aides** 11808, 12591
- Psychiatric Classification (Process)** [See Psychodiagnosis]
- Psychiatric Classifications (Taxon)** [See Psychodiagnostic Typologies]
- Psychiatric Clinics** 12041, 12353
- Psychiatric Disorders** [See Mental Disorders]
- Psychiatric History** [See Patient History]
- Psychiatric Hospital Admission** 12329
- Psychiatric Hospital Programs** [See Also Therapeutic Community] 12090, 12333, 12344, 12346, 12352
- Psychiatric Hospital Staff** [See Psychiatric Aides]
- Psychiatric Hospitalization** [See Also Commitment (Psychiatric), Psychiatric Hospital Admission] 11543, 12341, 12343, 12350, 12353
- Psychiatric Hospitals** 11549, 12175, 12275, 12338
- Psychiatric Nurses** 12352
- Psychiatric Patients** 11143, 11516, 11517, 11603, 11830, 11834, 11836, 11847, 11848, 11849, 11850, 11855, 11860, 11866, 11882, 11884, 11886, 11889, 11891, 11892, 11903, 11919, 11920, 12133, 12136, 12138, 12139, 12144, 12145, 12149, 12153, 12158, 12166, 12168, 12170, 12180, 12248, 12273, 12292, 12312, 12317, 12325, 12333, 12337, 12339, 12344, 12345, 12346, 12348, 12349, 12350, 12351, 12353
- Psychiatric Training** 11794, 12041, 12272, 12352
- Psychiatrists** 11562, 11896, 12086
- Psychiatry** [See Also Child Psychiatry, Community Psychiatry, Forensic Psychiatry, Social Psychiatry, Transcultural Psychiatry] 11887, 12034, 12035, 12042, 12045, 12050, 12052, 12282
- Psychic Energizers** [See Imipramine]
- Psychoanalysis** [See Also Dream Analysis] 12092, 12096, 12222, 12229, 12238, 12243, 12250, 12252, 12254, 12257, 12259, 12260, 12261, 12262, 12263, 12265, 12266, 12267, 12268
- Psychoanalysts** 12078, 12089
- Psychoanalytic Interpretation** 11496, 11639, 11644, 11654, 11854, 12264
- Psychoanalytic Personality Factors** [See Also Ego, Superego] 11720, 11747
- Psychoanalytic Theory** 10983, 11687, 11691, 11720, 12108, 12256, 12258, 12324
- Psychoanalytic Therapy** [See Psychoanalysis]
- Psychoanalytic Training** 11788
- Psychodiagnostics** 11549, 11753, 11830, 11849, 11860, 11884, 11893, 11894, 11896, 11898, 11904, 11930, 11952, 11962, 11985, 12062, 12093, 12128, 12144, 12290, 12329, 12343, 12345, 12348, 12349
- Psychodiagnostic Classificat (Proc)** [See Psychodiagnosis]
- Psychodiagnostic Classificat (Taxon)** [See Psychodiagnostic Typologies]
- Psychodiagnostic Typologies** 11850, 11867, 11874, 11888, 11895, 11898, 11900, 11914, 11930
- Psychodrama** 12113, 12211
- Psychodynamics** 11926
- Psychogenesis** [See Childhood Play Development, Cognitive Development, Emotional Development, Intellectual Development, Language Development, Moral Development, Perceptual Development, Personality Development, Psychosocial Development, Speech Development]
- Psychokinesis** 10765
- Psycholinguistics** 11427, 11643, 11664
- Psychological Correlates** [See Psychodynamics]

**Readiness (School)** [See School Readiness]  
**Reading** [See Also Oral Reading] 10834, 11237, 12458, 12489  
**Reading Ability** 11404, 11727, 12017, 12408, 12489, 12508, 12509  
**Reading Achievement** 12399, 12463, 12466, 12471, 12474, 12488, 12494, 12502, 12509  
**Reading Comprehension** 10875, 11426, 11670, 12408, 12493, 12775  
**Reading Disabilities** 11943, 11947, 11967, 11970, 12508  
**Reading Education** 11426, 12384, 12414, 12415, 12420, 12440, 12442, 12444, 12448, 12470, 12487, 12489, 12548  
**Reading Materials** 10875, 10901, 11816, 12364, 12366, 12408, 12415, 12432, 12440, 12442, 12454, 12494, 12627, 12775  
**Reading Measures** 12458, 12509, 12548, 12577  
**Reading Skills** 12488, 12503, 12524  
**Reading Speed** 10875, 11972  
**Readjustment (Psychosocial)** [See Psychosocial Readjustment]  
**Readmission (Hospital)** [See Hospital Admission]  
**Reality** 11429, 11676, 11746, 11860  
**Reality Testing** 11746  
**Reasoning** [See Also Inductive Deductive Reasoning, Inference] 10712, 11396  
**Rebuttal** [See Professional Criticism Reply]  
**Recall (Learning)** [See Also Free Recall] 10704, 10880, 10886, 10902, 10910, 10924, 10926, 10927, 10929, 10931, 10936, 10942, 10946, 10957, 10959, 10964, 10970, 11390, 11680, 12436  
**Recency Effect** 11598, 11964  
**Receptors (Neural)** [See Neural Receptors]  
**Recidivism** 11925  
**Reciprocity** 11600, 11636, 11695  
**Recognition (Learning)** 10798, 10857, 10907, 10908, 10921, 10931, 10941, 10948, 10949, 10962, 10970, 10974, 11651  
**Reconstruction (Learning)** 10795, 11430  
**Reconstructive Psychotherapy** [See Psychotherapy]  
**Recovery (Disorders)** 12005, 12068  
**Recreation** [See Also Athletic Participation, Baseball, Gambling, Sports, Television Viewing] 11568, 11621, 12004, 12328, 12757, 12763, 12766  
**Recreation Therapy** [See Also Art Therapy] 12330  
**Recruitment (Military)** [See Military Recruitment]  
**Recruitment (Personnel)** [See Personnel Recruitment]  
**Red Nucleus** [See Mesencephalon]  
**Reenlistment (Military)** [See Military Enlistment]  
**Reflex (Conditioned)** [See Conditioned Responses]  
**Reflex (Unconditioned)** [See Unconditioned Responses]  
**Reflexes** [See Also Acoustic Reflex, Eyeblink Reflex, Startle Reflex] 11198  
**Regression Analysis** [See Analysis of Variance]  
**Rehabilitation** [See Also Drug Rehabilitation, Psychosocial Rehabilitation, Vocational Rehabilitation] 11810, 12299, 12314, 12316, 12320  
**Rehabilitation (Drug)** [See Drug Rehabilitation]  
**Rehabilitation (Psychosocial)** [See Psychosocial Rehabilitation]  
**Rehabilitation (Vocational)** [See Vocational Rehabilitation]  
**Rehabilitation Centers** [See Sheltered Workshops]  
**Reinforcement** [See Also Differential Reinforcement, Fixed Interval Reinforcement, Fixed Ratio Reinforcement, Negative Reinforcement, Positive Reinforcement, Praise, Punishment, Reinforcement Amounts, Reinforcement Schedules, Rewards, Secondary Reinforcement, Social Reinforcement, Variable Interval Reinforcement] 10870, 10952, 11278, 11280, 11320, 12070, 12377, 12621, 12766  
**Reinforcement (Vicarious)** [See Vicarious Experiences]  
**Reinforcement Amounts** 11265  
**Reinforcement Schedules** [See Also Fixed Interval Reinforcement, Fixed Ratio Reinforcement, Variable Interval Reinforcement] 10689, 11171, 11265, 11268, 11274, 11279, 11284, 11289, 11290, 11292, 11294, 11295, 11298, 11303, 11305, 11306, 12671  
**Relations (International)** [See International Relations]  
**Relations (Peer)** [See Peer Relations]  
**Relaxation** 11568  
**Relaxation Therapy** [See Systematic Desensitization Therapy]  
**Relearning** 11135

**Reliability (Statistical)** [See Statistical Reliability]  
**Reliability (Test)** [See Test Reliability]  
**Religion** [See Also Related Terms] 11476, 11503  
**Religiosity** 11545  
**Religious Affiliation** [See Also Judaism, Shamanism, Zen Buddhism] 11487, 11490  
**Religious Beliefs** [See Also Judaism, Religiosity, Religious Affiliation, Shamanism, Zen Buddhism] 11476  
**Religious Personnel** [See Also Ministers (Religion), Nuns, Priests] 11548, 12682  
**Religious Practices** [See Asceticism, Confession (Religion), Faith Healing, Meditation]  
**REM Sleep** 10924, 10987, 11061, 11083, 11154  
**Remembering** [See Retention]  
**Remission (Disorders)** [See Spontaneous Remission]  
**Reply (To Professional Criticism)** [See Professional Criticism Reply]  
**Repression (Defense Mechanism)** 12092  
**Repression Sensitization** 11760  
**Republican Party** [See Political Parties]  
**Research** [See Experimentation]  
**Research Design** [See Experimental Design]  
**Research Methods** [See Methodology]  
**Resentment** [See Hostility]  
**Reserpine** 11089  
**Residency (Medical)** [See Medical Residency]  
**Residential Care Attendants** [See Attendants (Institutions)]  
**Residential Care Institutions** [See Also Halfway Houses, Hospitals, Nursing Homes, Orphanages, Psychiatric Hospitals] 12019, 12067, 12285, 12295, 12332, 12355, 12532  
**Resistance (Psychotherapeutic)** [See Psychotherapeutic Resistance]  
**Resistance (Skin)** [See Skin Resistance]  
**Resonance** [See Vibration]  
**Respiration** 11052, 11886  
**Respiration Stimulating Drugs** [See Caffeine]  
**Respiratory System** [See Olfactory Mucosa]  
**Respiratory Tract Disorders** [See Asthma, Laryngeal Disorders, Pulmonary Emphysema]  
**Respondent Conditioning** [See Classical Conditioning]  
**Response Amplitude** 11020  
**Response Bias** 10914, 10966  
**Response Lag** [See Reaction Time]  
**Response Latency** 10921, 10953, 12047  
**Response Parameters** [See Interresponse Time, Reaction Time, Response Amplitude, Response Latency, Response Set, Response Variability]  
**Response Set** 10717, 10945, 11475  
**Response Speed** [See Reaction Time]  
**Response Time** [See Reaction Time]  
**Response Variability** 10790  
**Responses** [See Conditioned Emotional Responses, Conditioned Responses, Conditioned Suppression, Emotional Responses, Orienting Responses, Unconditioned Responses]  
**Responsibility** 11549, 11566, 11589, 11617, 11767  
**Retail Stores** [See Shopping Centers]

**Retaliation** [See Reciprocity]  
**Retardation (Mental)** [See Mental Retardation]  
**Retarded (Mentally)** [See Mentally Retarded]  
**Retention** [See Also Recall (Learning), Recognition (Learning), Reconstruction (Learning)] 10920, 10934, 10948, 10954, 10973, 11166, 11275, 11291, 12490, 12503  
**Retention Measures** [See Also Free Recall, Recall (Learning), Recognition (Learning), Reconstruction (Learning)] 10965, 11996  
**Reticular Formation** 11013, 11128, 11139  
**Retina** 10845, 11245  
**Retinal Image** 10824, 10857  
**Retirement** 11470, 11608  
**Retroactive Inhibition** 10973, 11953  
**Reversal Shift Learning** 10904, 10907, 11160, 11271, 11277, 11304  
**Review (of Literature)** [See Literature Review]  
**Rewards** 11321, 11442, 11590, 11852, 12449  
**Ribonucleic Acid** 10995, 11046, 11047, 11068  
**Rigidity (Personality)** 11703, 12202  
**Risk Taking** [See Also Gambling] 10982, 11587, 12758  
**Ritalin** [See Methylphenidate]  
**RNA (Ribonucleic Acid)** [See Ribonucleic Acid]  
**Robbery** [See Theft]  
**Rod And Frame Test** 11920  
**Rodents** [See Chinchillas, Gerbils, Guinea Pigs, Mice, Rats, Squirrels]  
**Role Conflicts** 11453, 12693  
**Role Expectations** 11511, 11865, 12766  
**Role Perception** 10717, 11742, 12504, 12569, 12766  
**Role Playing** 11464, 11785, 11804  
**Roles** [See Also Parental Role, Sex Roles] 11485, 11742, 12693  
**Rorschach Test** 11753, 11935  
**Rotter Intern Extern Locus Cont Scal** 11689, 11770  
**RT (Response)** [See Reaction Time]

- Siblings [See Also Twins] 11882, 11986
- Side Effects (Drug) [See Also Drug Addiction, Drug Adverse Reactions, Drug Dependency, Heroin Addiction] 11150, 12142
- Sight Vocabulary 12399, 12466, 12521
- Sign Language 11640
- Signal Detection (Perception) 10762, 10766, 10779, 10807, 10820, 10823, 10828, 10852, 10930, 11037, 11208, 12773
- Signal Intensity [See Stimulus Intensity]
- Simulation [See Also Computer Simulation, Markov Chains, Mathematical Modeling, Simulation Games, Stochastic Modeling] 12601, 12666
- Simulation Games 11593
- Simulators [See Simulation]
- Single Persons 11509
- Sixteen Personality Factors Question 11929, 12316
- Size (Group) [See Group Size]
- Size Discrimination 11980
- Skeletal Muscle Relaxant Drugs [See Muscle Relaxing Drugs]
- Skill Learning 10919, 11897, 12499, 12771
- Skilled Industrial Workers 12683
- Skills [See Ability]
- Skin Conduction [See Skin Resistance]
- Skin Disorders [See Herpes Simplex]
- Skin Electrical Properties [See Also Skin Potential, Skin Resistance] 11054, 11139
- Skin Potential 11004
- Skin Resistance 11030, 11886
- Slang 11634, 11661
- Sleep [See Also NREM Sleep, REM Sleep] 10924, 11013, 11041, 11045,

# BRIEF SUBJECT INDEX

11059, 11061, 11129, 11147, 11207, 11228, 11229, 11242, 12141  
**Sleep Deprivation** 10962, 10987, 11084, 12701  
**Sleep Disorders** 11242  
**Sleep Inducing Drugs** [See Hypnotic Drugs]  
**Slow Wave Sleep** [See NREM Sleep]  
**Smell Perception** [See Olfactory Perception]  
**Smoking (Tobacco)** [See Tobacco Smoking]  
**Smooth Muscle Relaxant Drugs** [See Muscle Relaxing Drugs]  
**Snake Phobia** [See Ophidiophobia]  
**Social Acceptance** 11611, 11974  
**Social Adaptation** [See Social Adjustment]  
**Social Adjustment** 11744, 11855, 11936, 12349, 12547  
**Social Approval** 11449, 11534, 11554, 11697, 11734  
**Social Behavior** [See Also Aggressive Behavior, Altruism, Animal Aggressive Behavior, Animal Communication, Animal Courtship Behavior, Animal Courtship Displays, Animal Dominance, Animal Maternal Behavior, Animal Mating Behavior, Animal Social Behavior, Arguments, Assistance (Social Behavior), Attribution, Charitable Behavior, Collective Behavior, Competition, Compliance, Conflict, Conversation, Cooperation, Eye Contact, Gambling, Group Discussion, Group Participation, Group Performance, Interpersonal Attraction, Interpersonal Communication, Interpersonal Compatibility, Interpersonal Influences, Interpersonal Interaction, Interviewing, Interviews, Involvement, Job Applicant Interviews, Leadership, Leadership Style, Militancy, Negotiation, Participation, Peer Relations, Praise, Reciprocity, Responsibility, Risk Taking, Social Acceptance, Social Adjustment, Social Approval, Social Dating, Social Drinking, Social Facilitation, Social Interaction, Social Perception, Social Reinforcement, Trust (Social Behavior), Victimization, Violence, War] 11490, 11882  
**Social Casework** 12323, 12324  
**Social Caseworkers** [See Social Workers]  
**Social Change** 11474, 11480, 11567  
**Social Class** [See Also Lower Class, Middle Class, Upper Class] 11383, 11484, 11560, 11725  
**Social Class Attitudes** [See Socioeconomic Class Attitudes]  
**Social Dating** 11597  
**Social Deprivation** [See Also Social Isolation] 11959  
**Social Desirability** 11622, 11686, 11915  
**Social Drinking** 12150  
**Social Environments** [See Also Animal Environments, Classroom Environment, College Environment, Communities, Environmental Adaptation, Ghettos, Home Environment, Kibbutz, Neighborhoods, Rural Environments, School Environment, Suburban Environments, Urban Environments, Working Conditions] 11526, 11577, 11621, 11933, 12612  
**Social Equality** 11561, 11610, 11636, 11951  
**Social Facilitation** 11576, 11607

**Social Groups** [See Also Dyads, Minority Groups] 11417  
**Social Influences** [See Also Ethnic Values, Power, Prejudice, Propaganda, Social Approval, Social Desirability, Social Values] 11495, 11632  
**Social Interaction** [See Also Arguments, Assistance (Social Behavior), Charitable Behavior, Collective Behavior, Conflict, Conversation, Cooperation, Eye Contact, Group Discussion, Group Participation, Group Performance, Interpersonal Attraction, Interpersonal Communication, Interpersonal Compatibility, Interpersonal Influences, Interpersonal Interaction, Interviewing, Interviews, Job Applicant Interviews, Negotiation, Participation, Peer Relations, Social Dating, Victimization, Violence, War] 11472, 11577, 11621, 11865, 12004, 12359, 12760  
**Social Isolation** 10989, 11260, 11325, 11327, 11337, 11352, 11577, 12752  
**Social Learning** [See Also Imitation (Learning), Imprinting, Nonverbal Learning] 11511, 11588, 11748, 12229  
**Social Maladjustment** [See Social Adjustment]  
**Social Movements** [See Also Activist Movements, Civil Rights Movement, Homosexual Liberation Movement, Womens Liberation Movement] 12034  
**Social Perception** [See Also Attribution] 11420, 11451, 11452, 11461, 11502, 11573, 11586, 11591, 11597, 11599, 11601, 11603, 11605, 11609, 11613, 11616, 11618, 11619, 11621, 11623, 11627, 11632, 11633, 11660, 11668, 11676, 11695, 11697, 11743, 11787, 11927, 12363, 12750  
**Social Processes** [See Coalition Formation, Human Migration, Racial Integration, School Integration (Racial), Social Deprivation, Social Isolation, Socialization, Urbanization]  
**Social Psychiatry** 12057, 12273  
**Social Psychology** 10690, 10697, 10703, 11567, 11569  
**Social Reinforcement** [See Also Praise] 11554, 11572, 11595, 11620  
**Social Sciences** [See Also Anthropology, Applied Psychology, Child Psychology, Clinical Psychology, Community Psychology, Comparative Psychology, Developmental Psychology, Educational Psychology, Engineering Psychology, Industrial Psychology, Neuropsychology, Physiological Psychology, Psychology, School Psychology, Social Psychology, Sociology] 12720  
**Social Stress** 11325, 11606, 12000  
**Social Structure** [See Also Lower Class, Middle Class, Social Class, Upper Class] 12738  
**Social Values** 11480, 11543, 11545, 11922, 12100, 12103  
**Social Work** [See Social Casework]  
**Social Workers** 11777  
**Socialism** 12064, 12098, 12694  
**Socialization** 11443, 11460, 11521, 11602, 11912, 12019, 12679  
**Socially Disadvantaged** [See Disadvantaged]  
**Society** 11619  
**Sociocultural Factors** [See Also Acculturation, Cross Cultural Differences, Cul-

tural Deprivation, Culture Change, Ethnic Identity, Ethnic Values] 11473, 11547, 11701, 11792, 11885, 11943, 12094, 12101, 12256, 12453, 12475, 12691, 12696  
**Socioeconomic Class Attitudes** [See Also Lower Class Attitudes] 11480  
**Socioeconomic Status** [See Also Family Socioeconomic Level, Lower Class, Lower Income Level, Middle Class, Social Class, Upper Class] 11415, 11456, 11484, 11766, 12339, 12502, 12555, 12563, 12586, 12616  
**Sociology** 10691  
**Sociometric Tests** 11574, 11582  
**Sociopathy** [See Antisocial Personality]  
**Sociopathology** [See Antisocial Behavior]  
**Sodium** 11094  
**Sodium Pentobarbital** [See Pentobarbital]  
**Somesthetic Perception** [See Also Cutaneous Sense, Kinesthetic Perception, Pain Perception, Pain Thresholds, Tactile Perception, Temperature Perception, Vibrotactile Thresholds] 10771, 11234  
**Somesthetic Stimulation** [See Tactile Stimulation]  
**Sorting (Cognition)** [See Classification (Cognitive Process)]  
**Sound** [See Auditory Stimulation]  
**Sound Localization** [See Auditory Localization]  
**Sound Pressure Level** [See Loudness]  
**Sourness** [See Taste Stimulation]  
**South America** 11560  
**South Vietnam** 12676  
**Southeast Asia** 11829, 12114  
**Space (Personal)** [See Personal Space]  
**Spacecraft** 12752  
**Spaceflight** 12752  
**Spatial Discrimination** [See Spatial Perception]  
**Spatial Organization** 10851, 11347, 11392, 11433, 11945, 12604  
**Spatial Orientation (Perception)** 10771, 10818, 10819, 10836, 10847, 11012, 11256  
**Spatial Perception** [See Also Depth Perception, Distance Perception, Motion Perception, Size Discrimination, Spatial Organization, Spatial Orientation (Perception), Stereoscopic Vision] 10794, 10818, 11276, 11339, 11404, 11420, 11430, 11958  
**Spearman Rho** [See Rank Difference Correlation]  
**Special Education** 12429, 12512, 12514, 12515, 12521, 12522, 12523, 12526, 12528, 12529, 12530, 12531, 12532, 12534, 12535, 12536  
**Special Education (Aurally Handicapped)** [See Special Education]  
**Special Education (Emot Disturbed)** [See Emotionally Disturbed, Special Education]  
**Special Education (Gifted)** [See Gifted, Special Education]  
**Special Education (Learning Disabled)** [See Learning Disabilities, Special Education]  
**Special Education (Mentally Retard)** [See Mentally Retarded, Special Education]  
**Special Education (Phys Handicapped)** [See Physically Handicapped, Special Education]

- Special Education (Visual Handicap)** [See Special Education, Visually Handicapped]
- Special Education Students** 12517, 12518
- Special Education Teachers** 12375
- Specialization (Academic)** [See Academic Specialization]
- Spectral Sensitivity** [See Color Perception]
- Speech** [See Verbal Communication]
- Speech And Hearing Measures** 10797, 11379
- Speech Characteristics** [See Also Articulation (Speech), Speech Pauses, Speech Pitch, Speech Rate, Speech Rhythm] 10797, 10805, 10816, 11359, 11408, 11635, 11652, 11656, 11663, 11668, 11675, 11907, 11971, 12021
- Speech Development** 11415, 12533
- Speech Disorders** [See Also Articulation Disorders, Echolalia, Elective Mutism, Stuttering] 11953, 11975
- Speech Handicapped** 11974
- Speech Measures** [See Speech And Hearing Measures]
- Speech Pauses** 11787
- Speech Perception** 10769, 10797, 10798, 10800, 10801, 10802, 10805, 10806, 10811, 10815, 10816, 10961, 11016, 11372, 11410, 11965, 11970, 12013, 12024, 12028, 12516
- Speech Pitch** 11956, 11972
- Speech Processing (Mechanical)** [See Also Compressed Speech, Synthetic Speech] 11675
- Speech Rate** 11675
- Speech Rhythm** 11675, 11956
- Speech Therapists** 12036
- Speech Therapy** 12036, 12043, 12047, 12251
- Speed** [See Velocity]
- Speed (Response)** [See Reaction Time]
- Spelling** 10882
- Spiders** [See Arachnida]
- Spinal Cord** 11111
- Spinal Fluid** [See Cerebrospinal Fluid]
- Spokane Indians** [See American Indians]
- Spontaneous Remission** 12119
- Sports** [See Also Baseball] 10765, 12758, 12766, 12771
- Spouses** [See Also Housewives, Wives] 12218, 12241
- Spreading Depression** 11134
- Squirrels** 11354
- Standardization (Test)** [See Test Standardization]
- Standards (Professional)** [See Professional Standards]
- Startle Reflex** 11072, 11167, 11175
- State Hospitals** [See Psychiatric Hospitals]
- Statistical Analysis** [See Also Analysis of Variance, Cluster Analysis, Consistency (Measurement), Factor Analysis, Frequency Distribution, Oblique Rotation, Orthogonal Rotation, Predictability (Measurement), Statistical Measurement, Statistical Norms, Statistical Probability, Variability Measurement] 10720, 10722, 10724, 10727, 10744, 10749, 10750, 10753, 10754, 10757, 10758, 11203, 11650, 12040, 12054, 12144, 12424
- Statistical Correlation** [See Also Linear Regression, Nonlinear Regression, Rank Difference Correlation, Rank Order Correlation] 10724, 10728, 10733, 10736, 10737, 10738, 10753, 10754, 10758, 11686, 11731, 12510, 12572
- Statistical Measurement** [See Also Analysis of Variance, Cluster Analysis, Consistency (Measurement), Factor Analysis, Frequency Distribution, Oblique Rotation, Orthogonal Rotation, Predictability (Measurement), Statistical Norms, Statistical Probability, Variability Measurement] 10709, 10737, 10739, 12769
- Statistical Norms** 10897
- Statistical Probability** 10660, 10720
- Statistical Reliability** 10734, 10736, 10751
- Statistical Rotation** [See Oblique Rotation, Orthogonal Rotation]
- Statistical Samples** 10755
- Statistical Validity** [See Also Factorial Validity, Predictive Validity] 10719, 10738, 10751
- Statistical Variables** 11685
- Status** 11590, 11612, 11622, 11668, 12610, 12616, 12669
- Stealing** [See Theft]
- Stellate Ganglion** [See Autonomic Ganglia]
- Stepparents** 12393
- Stereopsis** [See Stereoscopic Vision]
- Stereoscopic Vision** 10837, 10848
- Stereotaxic Atlas** 10999, 11003
- Stereotaxic Techniques** [See Also Brain Stimulation, Chemical Brain Stimulation, Electrical Brain Stimulation, Spreading Depression] 11083, 11104, 11107, 11132
- Stereotyped Attitudes** 11481, 11515, 11616, 11626, 11798, 11877, 12358, 12402, 12494, 12542, 12551, 12610, 12623, 12705
- Stereotyped Behavior** 11079, 11137, 11230
- Sterilization (Sex)** [See Castration, Male Castration, Ovariectomy, Vasectomy]
- Steroids** [See Corticosteroids, Corticosterone]
- Stimulation** [See Also Afferent Stimulation, Auditory Stimulation, Aversive Stimulation, Brain Stimulation, Chemical Brain Stimulation, Electrical Brain Stimulation, Perceptual Stimulation, Prismatic Stimulation, Self Stimulation, Spreading Depression, Tactile Stimulation, Taste Stimulation, Visual Stimulation] 11138, 11389
- Stimulus (Conditioned)** [See Conditioned Stimulus]
- Stimulus Ambiguity** 10820
- Stimulus Complexity** 10810, 10850, 10936, 10979
- Stimulus Control** 11166, 11266, 11268, 11278, 11282, 11577
- Stimulus Deprivation** [See Food Deprivation, Sensory Deprivation, Social Deprivation, Social Isolation, Water Deprivation]
- Stimulus Discrimination** 10787, 10866, 11159, 11160, 11192, 11266, 11272, 11280, 11295, 11298, 11305, 11318, 11950, 11969
- Stimulus Duration** 10889, 10949, 10970
- Stimulus Exposure Time** [See Stimulus Duration]
- Stimulus Frequency** 10810, 11604
- Stimulus Generalization** 10921, 11159, 11283, 11295, 11312
- Stimulus Intensity** 11074, 11119
- Stimulus Intervals** [See Also Interstimulus Interval, Intertrial Interval] 11266
- Stimulus Novelty** 10893, 10941, 11178, 11264, 11434
- Stimulus Parameters** [See Also Interstimulus Interval, Intertrial Interval, Stimulus Complexity, Stimulus Duration, Stimulus Frequency, Stimulus Intensity, Stimulus Intervals, Stimulus Novelty, Stimulus Salience, Stimulus Variability] 10787, 10801, 11126, 11312, 11852
- Stimulus Pattern** [See Stimulus Variability]
- Stimulus Presentation Methods** [See Also Tachistoscopic Presentation] 10888, 10936, 10948, 10950, 10958, 10971, 10975, 10976, 11434, 12015, 12466
- Stimulus Salience** 10931
- Stimulus Variability** 10973, 11017, 11434, 11950
- Stipends** [See Educational Financial Assistance]
- Stochastic Modeling** [See Also Markov Chains] 10723
- Strain Differences (Animal)** [See Animal Breeding, Genetics]
- Strategies** 10874, 10906
- Stress** [See Also Environmental Stress, Occupational Stress, Physiological Stress, Psychological Stress, Social Stress, Stress Reactions] 10702, 10890, 10978, 10986, 11033, 11045, 11055, 11251, 11316, 11326, 11374, 11474, 11568, 11726, 11890, 12340, 12693
- Stress Reactions** 11033, 11065, 11360, 12774
- Strikes** 12737
- Strong Vocational Interest Blank** 10715, 12572, 12584
- Stroop Color Word Test** 11709
- Student Admission Criteria** 11807, 12358, 12369, 12544
- Student Attitudes** 11466, 11494, 11536, 11559, 12377, 12383, 12386, 12387, 12405, 12422, 12479, 12482, 12483, 12485, 12492, 12497, 12507, 12535, 12561, 12564, 12671
- Student Teachers** 12372
- Students** [See Also Business Students, College Students, Elementary School Students, Graduate Students, High School Students, Junior High School Students, Kindergarten Students, Medical Students, Special Education Students] 12378, 12411, 12486
- Studies (Followup)** [See Followup Studies]
- Studies (Longitudinal)** [See Longitudinal Studies]
- Study Habits** 12493
- Stuttering** 11907, 11909, 11971, 11972, 11973, 11976, 11977, 12028, 12251
- Subcortical Lesions** [See Brain Lesions]
- Subjectivity** [See Objectivity]
- Submucous Plexus** [See Autonomic Ganglia]
- Subnormality (Mental)** [See Mental Retardation]
- Subprofessional Personnel** [See Paraprofessional Personnel]
- Substantia Nigra** [See Mesencephalon]
- Suburban Environments** 12388
- Success** [See Achievement]

**Successive Contrast** [See Brightness Perception]  
**Suffering** 11701  
**Sugars** [See Glucose]  
**Suggestibility** 10927, 11033  
**Suicide** 11821, 11893, 11906, 11908  
**Suicide (Attempted)** [See Attempted Suicide]  
**Sulpuride** 11177  
**Superego** 11496, 11747  
**Superior Colliculus** 10994, 11028, 11144  
**Supervisors** [See Management Personnel]  
**Support (For Theories)** [See Professional Contribution]  
**Supportive Psychotherapy** [See Psychotherapy]  
**Suppression (Conditioned)** [See Conditioned Suppression]  
**Surgery** [See Also Adrenalectomy, Autopsy, Castration, Decerebration, Heart Surgery, Hemispherectomy, Induced Abortion, Male Castration, Organ Transplantation, Ovariectomy, Stereotaxic Techniques, Sympathectomy] 12043, 12307, 12309, 12313  
**Surgical Patients** 11894, 12310  
**Surveys** [See Also Consumer Surveys] 10709  
**Surveys (Opinion)** [See Attitude Measures]  
**Surveys (Personality)** [See Personality Measures]  
**Surveys (Preference)** [See Preference Measures]  
**Susceptibility (Hypnotic)** [See Hypnotic Susceptibility]  
**Sweating** 11061, 11204  
**Sweden** 11834, 12361  
**Sweetness** [See Taste Stimulation]  
**Switzerland** 12041  
**Syllables** 10800, 10958, 11410  
**Syllogistic Reasoning** [See Inductive Deductive Reasoning]  
**Symbiosis (Biological)** [See Biological Symbiosis]  
**Symbolism** 11394, 11431, 11960, 12258  
**Sympathectomy** 11116  
**Sympatholytic Drugs** [See Also Reserpine] 11166  
**Sympathomimetic Amines** [See Amphetamine, Catecholamines, Dextroamphetamine, Dopamine, Epinephrine, Methamphetamine, Norepinephrine]  
**Sympathomimetic Drugs** [See Also Amphetamine, Catecholamines, Dextroamphetamine, Dopamine, Epinephrine, Methamphetamine, Norepinephrine] 11200  
**Symposia** [See Professional Meetings And Symposia]  
**Symptoms** [See Also Anorexia Nervosa, Cataplexy, Catatonia, Convulsions, Delirium, Depersonalization, Distractibility, Fatigue, Headache, Hyperkinesia, Hyperthermia, Migraine Headache, Nausea, Obesity, Pain, Shock, Tremor] 11859, 11864, 11869, 11892, 11903, 11994, 11997, 12030, 12093, 12146  
**Synapses** 11152  
**Syndromes** [See Delirium Tremens, Downs Syndrome, Presenile Dementia, Senile Dementia, Toxic Psychoses]  
**Syntax** [See Also Sentence Structure] 11408, 11651, 11662, 11670, 11947, 11963, 12020, 12021, 12506, 12548

**Synthetic Speech** 10805, 11359, 11965  
**Systematic Desensitization Therapy** 11779, 12185, 12191, 12196, 12200, 12208, 12224, 12253, 12342  
**Systems Analysis** 10683, 10864, 12718

**T Groups** [See Sensitivity Training]  
**Tachistoscopic Presentation** 10840  
**Tactual Discrimination** [See Tactual Perception]  
**Tactual Displays** 12516  
**Tactual Perception** [See Also Vibrotactile Thresholds] 10788, 10794, 10796, 11111, 11355  
**Tactual Stimulation** 10794, 10796  
**Talent** [See Ability]  
**Talented** [See Gifted]  
**Tape Recorders** [See Videotape Recorders]  
**Task Analysis** 12659  
**Task Complexity** 12504  
**Task Difficulty** [See Task Complexity]  
**Taste Discrimination** [See Taste Perception]  
**Taste Perception** 10767, 10776, 10783, 10784, 11106, 11157, 11158, 11165, 11309  
**Taste Stimulation** 10767, 10783, 10784, 11157, 11158, 11309, 11382  
**Taxonomies** 10981, 11646, 11647, 11973, 12230, 12421, 12448, 12649, 12743  
**Tea (Drug)** [See Caffeine]  
**Teacher (Evaluation of)** [See Personnel Evaluation, Teachers]  
**Teacher Attitudes** 12271, 12367, 12371, 12387, 12390, 12534, 12675  
**Teacher Characteristics** [See Also Teacher Attitudes, Teacher Personality] 12370, 12377, 12388, 12393, 12486, 12562  
**Teacher Education** [See Also Inservice Teacher Education] 12368, 12372, 12373, 12375, 12385, 12389  
**Teacher Effectiveness** [See Teacher Characteristics]  
**Teacher Personality** 12389, 12498  
**Teacher Student Interaction** 12377, 12393, 12406, 12423, 12434, 12500, 12507, 12559, 12562  
**Teacher Training** [See Teacher Education]  
**Teachers** [See Also College Teachers, Elementary School Teachers, High School Teachers, Special Education Teachers, Student Teachers] 11436, 11626, 12378, 12388, 12393, 12394, 12404, 12556, 12684  
**Teaching** [See Also Audiovisual Instruction, Computer Assisted Instruction, Educational Field Trips, Group Instruction, Individualized Instruction, Instructional Media, Lecture Method, Lesson Plans, Montessori Method, Open Classroom Method, Programed Instruction, Reading Materials, Teaching Methods, Team Teaching Method, Televised Instruction] 12372, 12383, 12384, 12395, 12413, 12421, 12425, 12464, 12465, 12499  
**Teaching (Programed)** [See Programed Instruction]  
**Teaching Methods** [See Also Audiovisual Instruction, Computer Assisted Instruction, Educational Field Trips, Group Instruction, Individualized Instruction, Lecture Method, Lesson Plans, Montessori Method, Open Classroom Method, Programed Instruction, Team Teaching

Method, Televised Instruction] 10884, 11808, 12368, 12380, 12398, 12399, 12404, 12411, 12415, 12420, 12422, 12424, 12433, 12434, 12435, 12436, 12439, 12450, 12455, 12460, 12463, 12466, 12468, 12470, 12471, 12472, 12474, 12477, 12489, 12495, 12500, 12512, 12534, 12634, 12764  
**Team Teaching Method** 12359, 12361  
**Technology** 10677, 12757  
**Teenagers** [See Adolescents]  
**Teeth (Anatomy)** 11145  
**Telecommunications Media** [See Closed Circuit Television, Telephone Systems, Television, Television Advertising]  
**Telekinesis** [See Psychokinesis]  
**Telencephalon** [See Amygdaloid Body, Auditory Cortex, Caudate Nucleus, Cerebral Cortex, Corpus Callosum, Hippocampus, Limbic System, Occipital Lobe, Visual Cortex]  
**Telepathy** 10765  
**Telephone Hot Lines** [See Hot Line Services]  
**Telephone Systems** 11612  
**Televised Instruction** 12419, 12521  
**Television** [See Also Closed Circuit Television, Television Advertising] 11665  
**Television Advertising** 11637, 11665  
**Television Viewing** 11657  
**Temperament** [See Personality]  
**Temperature (Body)** [See Body Temperature]  
**Temperature Effects** [See Also Cold Effects, Heat Effects] 11058, 11347  
**Temperature Perception** 11244  
**Temporal Lobe** [See Auditory Cortex]  
**Temptation** 11449, 11747  
**Tenure (Occupational)** [See Occupational Tenure]  
**Terminally Ill Patients** 11780, 12334  
**Terminology (Psychological)** [See Psychological Terminology]  
**Territoriality** 11249, 11354, 11901  
**Test (Achievement)** [See Achievement Measures]  
**Test (Aptitude)** [See Aptitude Measures]  
**Test (Intelligence)** [See Intelligence Measures]  
**Test Administration** 11711, 12544, 12574  
**Test Anxiety** 12185, 12498, 12567  
**Test Bias (Cultural)** [See Cultural Test Bias]  
**Test Construction** [See Also Cultural Test Bias, Difficulty Level (Test), Item Analysis (Test), Test Items, Test Reliability, Test Standardization, Test Validity] 10811, 12539  
**Test Items** 10743, 11686, 12560  
**Test Normalization** [See Test Standardization]  
**Test Norms** 11710, 11920  
**Test Reliability** 10714, 10716, 10811, 11776, 11857, 11995, 12298, 12539  
**Test Scores** 10716, 10743, 12541, 12560  
**Test Standardization** 10712, 10714, 11966, 12577  
**Test Validity** 10714, 10717, 11995, 12298, 12484, 12539, 12554, 12613, 12640, 12657, 12680, 12735  
**Testes** 11216  
**Testimony (Expert)** [See Expert Testimony]  
**Testing** [See Cultural Test Bias, Difficulty Level (Test), Item Analysis (Test),

# BRIEF SUBJECT INDEX

- Rating, Scaling (Testing), Scoring (Testing), Test Administration, Test Items, Test Reliability, Test Standardization, Test Validity]
- Testing (Hypothesis) [See Hypothesis Testing]
- Testing (Job Applicant) [See Job Applicant Screening]
- Testing (Reality) [See Reality Testing]
- Testing Methods [See Also Multiple Choice (Testing Method)] 11830, 12439, 12458, 12654
- Testosterone 11039, 11213
- Tests [See Measurement]
- Tests (Personality) [See Personality Measures]
- Tetrahydrocannabinol 11162, 11165, 11171, 11187, 11190, 11191, 11192, 11193
- Thalamus 11124
- Theft 11617
- Thematic Apperception Test 11935
- Theology [See Religion]
- Theories of Education 12360, 12606
- Theories [See Also Related Terms] 10653, 10686, 10691, 10700, 11366, 11565, 12042, 12052, 12607
- Theory of Evolution 10671, 10706, 10993
- Therapeutic Abortion [See Induced Abortion]
- Therapeutic Community 12041, 12062, 12131, 12143, 12154, 12281, 12344
- Therapeutic Techniques (Psychother) [See Psychotherapeutic Techniques]
- Therapist Attitudes [See Therapist Characteristics]
- Therapist Characteristics 11773, 11786, 11796, 12065, 12068, 12120, 12123, 12181, 12247
- Therapist Effectiveness [See Therapist Characteristics]
- Therapist Experience [See Therapist Characteristics]
- Therapist Patient Interaction [See Psychotherapeutic Processes]
- Therapist Personality [See Therapist Characteristics]
- Therapist Trainees 11773
- Therapists [See Also Related Terms] 11792
- Therapy [See Treatment]
- Therapy (Drug) [See Drug Therapy]
- Therapy (Encounter Group) [See Encounter Group Therapy]
- Therapy (Individual) [See Individual Psychotherapy]
- Thermal Acclimatization 11048
- Thermoreceptors 11097
- Thermoregulation (Body) 11061, 11097
- Thinking [See Also Abstraction, Inductive Deductive Reasoning, Inference, Logical Thinking, Reasoning] 11630, 12388
- Thirst 11223
- Thorazine [See Chlorpromazine]
- Thought Disturbances [See Also Amnesia, Memory Disorders, Perseveration] 11841, 11904
- Threat 11449
- Threshold Determination 10783
- Thresholds [See Also Auditory Thresholds, Dark Adaptation, Olfactory Thresholds, Pain Thresholds, Sensory Adaptation, Vibrotactile Thresholds, Visual Thresholds] 10996, 11162
- Thyroid Stimulating Hormone [See Thyrotropin]
- Thyrotropic Hormone [See Thyrotropin]
- Thyrotropin 12168
- Time [See Interresponse Time]
- Time (Interresponse) [See Interresponse Time]
- Time Estimation 10789, 10817, 11878
- Time Perception [See Also Time Estimation] 10791, 10851, 10936, 11395, 11529, 11919
- Tiredness [See Fatigue]
- Tissues (Body) [See Bones, Membranes, Nictitating Membrane, Olfactory Mucosa]
- Tobacco (Drug) [See Nicotine]
- Tobacco Smoking 11161, 11495, 11531, 11534, 11535, 11735, 12037, 12237, 12459
- Toes (Anatomy) [See Feet (Anatomy)]
- Tofranil [See Imipramine]
- Token Economy Programs 12331, 12337, 12351
- Token Reinforcement [See Secondary Reinforcement]
- Tolerance (Drug) [See Drug Tolerance]
- Tone (Frequency) [See Pitch (Frequency)]
- Tongue 12043
- Top Level Managers 10773, 12723
- Torticollis 12206
- Touch [See Tactile Perception]
- Toxic Disorders [See Also Alcohol Intoxication, Mercury Poisoning, Narcosis, Toxic Encephalopathies, Toxic Hepatitis, Toxic Psychoses] 12155
- Toxic Encephalopathies [See Also Alcohol Intoxication] 12027
- Toxic Hepatitis 11190
- Toxic Psychoses 12134
- Toxicity 11146, 11165, 11168, 11185, 11248
- Toxins [See Poisons]
- Toy Selection 11449
- Trace (Memory) [See Memory Trace]
- Tracking [See Visual Tracking]
- Traffic Accidents (Motor) [See Motor Traffic Accidents]
- Trainable Mentally Retarded 12525
- Training [See Education]
- Training (Clinical Methods) [See Clinical Methods Training]
- Training (Community Mental Health) [See Community Mental Health Training]
- Training (Graduate Psychology) [See Graduate Psychology Education]
- Training (Mental Health Inservice) [See Mental Health Inservice Training]
- Training (Personnel) [See Personnel Training]
- Training (Psychiatric) [See Psychiatric Training]
- Training (Psychoanalytic) [See Psychoanalytic Training]
- Tranquilizing Drugs [See Also Amitriptyline, Chlordiazepoxide, Chlorpromazine, Diazepam, Fluphenazine, Haloperidol, Mesoridazine, Neuroleptic Drugs, Phenothiazine Derivatives, Pimozide, Prochlorperazine, Reserpine] 11247, 12145
- Transcultural Psychiatry 11862, 12071, 12079, 12091, 12100, 12107, 12109, 12114, 12115
- Transfer (Learning) 10905, 10978, 11266, 11339, 12472
- Transference (Psychotherapeutic) [See Psychotherapeutic Transference]
- Transfusion (Blood) [See Blood Transfusion]
- Transplants (Organ) [See Organ Transplantation]
- Transportation [See Automobiles]
- Transportation Accidents [See Also Motor Traffic Accidents] 12770, 12772
- Transposition (Cognition) 10866
- Transsexualism 11829, 11832, 11926, 12307, 12313
- Trauma (Emotional) [See Emotional Trauma]
- Trauma (Physical) [See Injuries]
- Traumatic Psychosis [See Reactive Psychosis]
- Treatment Effectiveness Evaluation 11778, 12135, 12138, 12144, 12145, 12152, 12170, 12218, 12219, 12281, 12298, 12346, 12355
- Treatment Facilities [See Child Guidance Clinics, Community Mental Health Centers, Halfway Houses, Hospitals, Nursing Homes, Psychiatric Clinics, Psychiatric Hospitals]
- Treatment Methods (Physical) [See Physical Treatment Methods]
- Treatment [See Also Related Terms] 12053, 12290
- Tremor 10763, 12002
- Trial And Error Learning 12438
- Tribes 11510
- Trigeminal Nerve 10770
- Trochlear Nerve [See Cranial Nerves]
- Trust (Social Behavior) 11696, 12389, 12612, 12724

- Tutors [See Teachers]
- Twins 11073
- Type I Errors 10721
- Typing [See Clerical Secretarial Skills]
- Typists [See Clerical Personnel]
- Typologies (Psychodiagnostic) [See Psychodiagnostic Typologies]
- Ulcers (Gastrointestinal) [See Gastrointestinal Ulcers]
- Ultrasound 12605
- Unconditioned Reflex [See Unconditioned Responses]
- Unconditioned Responses 11293
- Underachievement (Academic) [See Academic Underachievement]
- Undergraduate Degrees [See Educational Degrees]
- Undergraduates [See College Students]
- Underprivileged [See Disadvantaged]
- Understanding [See Comprehension]
- Underwater Effects 12765
- Underweight [See Anorexia Nervosa]
- Unemployment 12612, 12651, 12674
- Union of Soviet Socialist Republics 11073, 11506, 11546, 12048, 12515
- United Kingdom 11896, 12528
- United States 11473, 11479, 11482, 11614, 11729, 11740, 11741, 11849, 11896, 12586, 12616, 12723
- Universities [See Colleges]
- Unwed Mothers 12128
- Upper Class 11485, 11610
- Urban Environments [See Also Ghettos] 10918, 12388, 12553, 12633

# BRIEF SUBJECT INDEX

- Urban Ghettoes [See Ghettoes]  
 Urban Planning 12586  
 Urbanization 11510  
 Urinary Function Disorders [See Urinary Incontinence]  
 Urinary Incontinence 11916  
 Urination 11092, 11239, 11871  
 Urine 12005  
 Urogenital Disorders [See Male Genital Disorders, Urinary Incontinence]  
 Urogenital System [See Female Genitalia, Gonads, Male Genitalia, Penis, Prostate, Testes]
- Validity (Statistical) [See Statistical Validity]  
 Validity (Test) [See Test Validity]  
 Valium [See Diazepam]  
 Values [See Also Ethnic Values, Personal Values, Social Values] 10718, 11587, 11937, 12370, 12428, 12638, 12658  
 Variability (Response) [See Response Variability]  
 Variability (Stimulus) [See Stimulus Variability]  
 Variability Measurement [See Also Analysis of Variance] 10725, 10755  
 Variable Interval Reinforcement 11319  
 Variables (Statistical) [See Statistical Variables]  
 Variance [See Variability Measurement]  
 Vascular Disorders [See Cardiovascular Disorders]  
 Vasectomy 11615  
 Vasoconstrictor Drugs [See Amphetamine, Methamphetamine, Norepinephrine, Serotonin, Tryptamine]  
 Vasodilation 10860, 11081  
 Vasodilator Drugs 11145  
 Velocity 10795, 10817  
 Venereal Diseases 12003  
 Verbal Ability 11400, 11653, 11716, 11960, 12001, 12006, 12484, 12485, 12502  
 Verbal Communication [See Also Articulation (Speech), Bilingualism, Compressed Speech, Consonants, Conversation, Dialect, Foreign Languages, Form Classes (Language), Grammar, Homographs, Initial Teaching Alphabet, Language, Language Development, Letters (Alphabet), Linguistics, Morphemes, Nouns, Numbers (Numerals), Orthography, Paragraphs, Phonemes, Phonetics, Psycholinguistics, Semantics, Sentence Structure, Sentences, Sight Vocabulary, Sign Language, Slang, Speech Characteristics, Speech Pauses, Speech Pitch, Speech Processing (Mechanical), Speech Rate, Speech Rhythm, Syllables, Syntax, Synthetic Speech, Verbal Fluency, Verbs, Vocabulary, Vowels, Words (Phonetic Units), Written Language] 10809, 10887, 10902, 10926, 10956, 11590, 11640, 11648, 11656, 11662, 11673, 11676, 11886, 11907, 11956, 11968, 12255, 12262, 12294, 12500  
 Verbal Conditioning [See Verbal Learning]  
 Verbal Fluency 11403, 11942, 11976  
 Verbal Learning [See Also Nonsense Syllable Learning, Paired Associate Learning, Serial Learning] 10883, 10886, 10893, 10898, 10901, 10906, 10912, 10916, 10963, 11431, 11967, 12399, 12525  
 Verbal Meaning 10877, 10942, 11259  
 Verbal Reinforcement [See Praise]  
 Verbalization [See Verbal Communication]  
 Verbs 10942, 10968  
 Vertebrates [See Also Baboons, Birds, Carp, Cats, Chickens, Chinchillas, Cichlids, Deer, Dogs, Dolphins, Doves, Ducks, Fishes, Frogs, Gerbils, Goldfish, Guinea Pigs, Mammals, Mice, Monkeys, Pigeons, Primates (Nonhuman), Quails, Rabbits, Rats, Sea Gulls, Squirrels] 11010  
 Veterans (Military) [See Military Veterans]  
 Vibration 10778  
 Vibrotactile Thresholds 10764, 10778, 10790, 10793, 12043  
 Vicarious Experiences 10912  
 Vicarious Reinforcement [See Vicarious Experiences]  
 Victimization 11613  
 Videotape Recorders 12368  
 Videotapes 11386, 11416, 11805, 12372  
 Vigilance 10855  
 Vineland Social Maturity Scale 12019  
 Violence 10677, 11543, 11592, 11613  
 Viral Disorders [See Herpes Simplex, Measles, Rubella]  
 Vision [See Binocular Vision, Brightness Perception, Color Perception, Dark Adaptation, Monocular Vision, Stereoscopic Vision, Visual Discrimination, Visual Field, Visual Perception, Visual Thresholds]  
 Visions (Mysticism) [See Mysticism]  
 Visitation (Hospital) [See Institution Visitation]  
 Visitation (Institution) [See Institution Visitation]  
 Visitation (Psychiatric Hospital) [See Institution Visitation]  
 Visual Cortex 11012, 11018, 11113  
 Visual Discrimination 10766, 10819, 10823, 10831, 10848, 11135, 11271, 11275, 11277, 11312, 11980, 11995, 12015, 12474, 12503  
 Visual Displays 10704, 10830, 11431, 11650, 12756, 12773  
 Visual Evoked Potentials 11007, 11017, 11099, 11235  
 Visual Feedback 11412, 11571, 12525  
 Visual Field 10825, 10833, 10840, 10845, 10875, 10930, 11970, 12016, 12017, 12756  
 Visual Perception [See Also Binocular Vision, Brightness Perception, Color Perception, Dark Adaptation, Monocular Vision, Stereoscopic Vision, Visual Discrimination, Visual Field, Visual Thresholds] 10769, 10795, 10817, 10820, 10821, 10824, 10826, 10827, 10828, 10830, 10834, 10840, 10842, 10843, 10845, 10847, 10850, 10854, 10855, 10857, 10858, 10871, 10878, 10882, 10910, 10928, 10940, 11008, 11355, 11404, 11870, 11970, 11996, 12016, 12512, 12524  
 Visual Stimulation [See Also Illumination, Photopic Stimulation, Prismatic Stimulation, Tachistoscopic Presentation, Visual Feedback] 10698, 10769, 10822, 10826, 10893, 10921, 10926, 10946, 10948, 10949, 10952, 10959, 10970, 11009, 11022, 11028, 11099, 11967, 12016, 12427, 12471  
 Visual Thresholds [See Also Dark Adaptation] 10833, 10852, 11124  
 Visual Tracking 10829, 12773  
 Visually Handicapped [See Also Blind, Partially Sighted] 12016, 12512, 12515, 12524, 12578  
 Vitamins [See Also Nicotinamide] 11134  
 Vocabulary [See Also Homographs, Sight Vocabulary, Slang] 10884, 10955, 10967, 11468  
 Vocalization [See Also Animal Vocalizations, Voice] 10800, 10816  
 Vocalizations (Animal) [See Animal Vocalizations]  
 Vocational Adjustment [See Occupational Adjustment]  
 Vocational Aspirations [See Occupational Aspirations]  
 Vocational Choice [See Occupational Choice]  
 Vocational Counseling [See Occupational Guidance]  
 Vocational Counselors 12648  
 Vocational Education 12535, 12565, 12575, 12578, 12642, 12652, 12678, 12755  
 Vocational Guidance [See Occupational Guidance]  
 Vocational Interests [See Occupational Interests]  
 Vocational Mobility [See Occupational Mobility]  
 Vocational Preference [See Occupational Preference]  
 Vocational Rehabilitation 11809, 11810, 12319, 12321, 12322, 12325, 12326, 12327, 12633  
 Vocations [See Occupations]  
 Voice 10798, 10800, 10816, 11668  
 Volunteer Military Personnel 12614  
 Volunteer Personnel [See Volunteer Military Personnel]  
 Volunteers (Experiment) [See Experimental Volunteers]  
 Vomit Inducing Drugs [See Emetic Drugs]  
 Voting Behavior 11507, 11513, 11555  
 Vowels 10834, 10961, 11965
- Wages [See Salaries]

# P PA PAS PASA PASAR

is an innovative service designed to benefit the individual users of psychology-related information. It provides a comprehensive literature search capability at a level of complexity achievable only through automated retrieval techniques. The intellectual burden for conducting an effective search is shared by the requester and APA information specialists who formulate specific retrieval strategies, augmenting vocabulary and other search parameters supplied by the requester. Experience has provided APA information specialists with the skills to efficiently interact with the automated data base which contains records published in PSYCHOLOGICAL ABSTRACTS from 1967 through the present.

Charges for processing PASAR requests are based on the amount of computer time required to perform a search. Typically these charges range from \$40 to \$60 and will not exceed \$100 unless the requester is contacted first. The total charge for a search is based on its complexity and is in most cases unrelated to the number of references retrieved. For example, a complex search strategy involving many variables or limiting factors may require more computer time and may result in fewer references retrieved than a broad search with few limiting factors.

## PASAR Search Request Guidelines

The PASAR Request Form has been designed to assist you in constructing a comprehensive statement of your requirements. However, it should not restrict your input. Provide whatever other information you feel will augment the information specialist's understanding of your requirements. These guidelines should help to clarify items on the Request Form.

**ITEM 1. Narrative statement of search topic.** Provide a detailed description of the subject matter you wish to be retrieved. Please avoid submitting multiple, discrete requests on a single PASAR Request Form, since such cannot be processed for a single fee. However, multiple aspects of a primary subject may be requested. The distinction is illustrated in the following examples:

*Acceptable:* "the effects of socioeconomic status, education level, or birth order on career motivation in women."

"Career motivation" is the primary element of this request, while the other elements serve merely to qualify or narrow the scope of this rather broad subject area.

*Unacceptable:* "the measurement of employee attitudes concerning wages and benefits. Also desire references dealing with the factors that influence management decision-making with respect to personnel policies and procedures."

Although these two topics are closely related to the design and administration of personnel policies and procedures, two separate search strategies would have to be executed to retrieve the specific information requested, and a separate charge for each would have to be made.

**ITEM 2. Descriptor(s) relevant to dependent variable(s).** Provide a list of words or phrases that indicate the subject matter of prime interest. Descriptors for the "acceptable" example (see Item #1) might include: career motivation, career preference, and career aspirations.

**ITEM 3. Descriptor(s) relevant to independent variable(s).** Provide a list of words or phrases that will qualify or narrow the scope of the dependent variable. Descriptors for the "acceptable" example (see Item #1) might include: socioeconomic status, social class, educational level, birth order, and women.

**ITEM 4. Search qualifications.** Once the subject matter of the search has been defined, you may wish to refine it with specific requirements such as population or time frame. These qualifications are often essential to the actual information need; however, they can unnecessarily limit the search, causing retrieval of few of the relevant records. Therefore, consider your requirements carefully.

**ITEM 5. Sorting requirements.** Please indicate whether you would prefer to have references sorted alphabetically by author or chronologically by year.

**ITEM 6. Intended use of search results.** Provide a description of how the references resulting from your search will be used (e.g., definition of a research project, preparation of an article, proposal preparation, dissertation, etc.).

**Ordering information:** When ordering a PASAR search, please read the above guidelines carefully before completing the request form. A purchase order must accompany all institutional requests for a PASAR search. For individuals requesting a PASAR search, the signature of the person responsible for payment must appear on the PASAR request form.
